the above number in the Register of Books,
which is always open to inspection.*

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞ The foregoing Regulations will be strictly enforced. ☞

VOLUME LIV
Number 1.

Huson's Wire-Rope Tramway for Mines.

The system of transporting ore, etc., over rough surfaces and up and down steep mountains by means of a wire-rope tramway, has proven itself reliable and convenient. In the Huson system, which we illustrate in this number of the PRESS, the principle of construction may be briefly described as consisting of an endless wire rope, traveling over grooved wheels or sheaves secured to the cross-arms of elevated supports placed from 100 to 300 feet apart; the rope, carrying suspended buckets, so fixed as to clear the sheaves, passes around large horizontal or inclined wheels provided with devices for gripping the rope, which prevents the same from slipping and enables its speed to be regulated. It will be seen that when the rope is set in motion, either by gravitation or by motive power, it will carry with it the buckets at such a rate of speed as may be determined to be most suitable for the amount of material to be moved, and where the grade is not less than 15 feet in 100 feet it will transport freight without the aid of power—the loaded line down being sufficient to overcome all friction and carry the empty buckets up the grade. The use of the foregoing system is now quite extensive and is especially adapted to the transportation of ores from mine to mill or point of shipment. It may be run at all times, equally as well through night and storm as mid-day of the finest weather. It is never subject to snow blockade, and requires no grading.

In this system there are grip-wheels at the ends with adjustable grips that can be set or adjusted to any sized rope—ropes are continually wearing and shrinking in diameter—and the adjustable grip is necessary to hold the rope while being run by gravity or power. There are metalline-bushed sheaves on all the derricks or stations which require no oil or other lubricant. The vertical clip enables the rope to run in an open-grooved sheave of any depth. The peculiar construction of the clip, in connection with the sheave and skip outside, admits of curves being made with safety, and strong winds cannot blow the rope off. Another peculiarity of this device is that it has "angle-wheels," which enables a right-angle turn to be made.

In addition to the automatic loader and dumper at the end of the line, there is one which may be placed along the line anywhere, connecting as many mines as may be desired, and so arranged as to load alternate buckets and deposit the ore by dumping into separate bins with precision and regularity.

A general view of the Pay-rock tramway at Silver Plume, Colorado, built on this system, is given on this page. This tramway is at an angle of 21°, and coal is frequently carried to the mine by loading every third ascending bucket, which does not materially diminish speed of buckets.

Fig. 2, on page 5, represents the upper terminal of the Huson system and the manner of loading the buckets. As the bucket approaches, the bail of the bucket intersects with and is held by the sprocket or rag-wheel; the pendant of the bucket coming in contact with a stop projecting outward from the loading car, prevents the bucket from passing around the

way is never stopped for loading. One man is necessary to charge this hopper or car where only 50 tons are moved in 10 hours. Where larger quantities are moved it will require more help. This upper end is provided with a brake, which requires one man to regulate the running and is always under his control.

Fig. 3, page 5, represents the lower end, showing the mode of dumping of the bucket. This lower terminal is pitched or inclined to conform with the mountain, and by means of the side car or cage the pendant is changed from a hanging or vertical position to that of right angles with the rope. When the pendant comes in contact with the cage, the lower end

have a sliding movement, to tighten the cable without cutting and splicing the rope.

A number of these Huson patent tramways are in use in various mining districts, for transporting ore, supplies, timber, coal, etc. They are arranged to convey passengers also, some of them carrying the men to and from the mine or mill. In mountainous districts they are invaluable, and more especially where heavy snows are common. The agents in this city are Parke & Lacy, No. 21 Fremont street.

"Fine" vs. "Find"?

In reply to the note of "Prospector," published in a late issue of the PRESS, we admit that the passage in the Bible cited by us was misquoted, as we knew at the time. It occurs in Job 8-1, and reads as follows: "Surely there is a vein for the silver and a place for the gold, where they *fine* it," not *find*, as we had it. But for all that, we believe, with some biblical commentators, that our rendering of the text is the correct one. The sacred writer is here describing where and under what conditions the precious metals occur; silver in veins and gold, as "Prospector" himself remarks, in placers, or in such places as you may happen to *find* it. What sense would there be in saying silver occurs in veins, but gold in refineries, mints, banks, treasures, etc.? Evidently the Bible version of this passage is

to be classed among the many typographical errors with which that book is said to abound.

"Prospector" appears to have great confidence in the biblical lore of our local clergy, forgetting that only last year one of these divines, conspicuous for his learning, declared from his pulpit that nowhere does the Scripture say that Jonah was swallowed by a *whale*, but by a *great fish*; whereas, the New Testament tells us that as Jonah was three days and three nights in the *whale's* belly, so was the Son of Man three days and three nights in the sepulcher! Between the mistakes of the translators and printers, and an occasional blunder on the part of the preachers, there is reason to fear that much of error has crept into the text as well as into the interpretations of Holy Writ, all which we feel called upon to correct, more especially in that department of theology that relates to mining.

THE World has organized a snowshoe expedition, under the leadership of Lieutenant Frederick Schwatka, of arctic fame, for the mid-winter exploration of that wonderland of this hemisphere, the Yellowstone National Park.

HUSON TRAMWAY AT PAY-ROCK MINE, SILVER PLUME, COLORADO.

end, without moving the loading car with it, and as the loading car moves upon a circular track, the cam at the top raises the gate of the loading car by means of a grooved roller connected to the gate, and allows the load to drop directly into the bucket. It will be seen that the loading car cannot be moved except with the pendant, and the bucket, therefore, must be directly under the loading car before the car is moved. This car runs upon a circular track, and travels one-half of the circumference of the wheel, which is eight feet in diameter. And when the car gets nearly to its destination the track diverges from the center, which causes the car to loosen itself from the pendant, and is returned by means of a weight attached to it with rope running over sheave wheels. This loading car, with its triangular hopper or body, runs under the platform upon which the ore is dumped. This platform having a hole or a chute in it, directly over the loading car, the ore is put in by shoving it from this platform down through this hole or chute, and when sufficiently filled the bucket comes along and takes the car with it, thereby taking on its load. This operation is repeated, and the tram-

is held back by a projection on a tripping bar connected to or with said car, until the clip at upper end of pendant, which is fast to the rope, strikes or comes against a similar stop at the upper end of the tripping bar, then the cage is moved downward with the clip upon the rope until the bail of the bucket is fairly into the sprocket-wheel; then the tripping bar and stops are released and the cage is returned with a weight ready for the next bucket. The cam or bar of iron which tips the bucket can be bent and arranged so as to turn the bucket directly upside down and hold in that position until it passes away from the wheel opposite to where it enters. This cam can be placed upon the side of the terminal, and, in connection with the cage or car, will dump the bucket at the side; and, by extending the track upon which the cage or car runs, a series of cams will dump the ore into several bins, and if more than one mine is upon the tramway, the pins at the bottom of the bucket can be made of different lengths, with the came of different heights, and the ores will be dumped into their respective bins automatically with precision. This lower terminal is built usually so as to

Oregon Mines.

Quartz and Placers of Josephine County.

From an extended article in the *Oregonian* we condense the following:

Rugged mountains alternating with steep canyons and narrow valleys make up the northern portion of Josephine county, a region that is good for little besides mining. The rocks contain auriferous quartz veins, and placers are found upon nearly all the streams. The water-courses connect with Rogue river, the streams flowing a westerly course. Toward the north is Wolf creek, upon which there are some eight or ten gravel miners employed. On Coyote creek is the noted Ruble claim, which gives employment to a dozen men in the season when water is plenty, and has enough good pay dirt to last for 20 years. By some this claim is held to be the most valuable in Southern Oregon. Its yearly output is not known, but there is no doubt that it is being worked with judgment and energy. On Tom East creek, Joe Dicer took out \$1000 in the middle of last season before it was time to clean up. Again, no figure of production can be given, but it is probably fair to credit these creeks and their tributaries of Northern Josephine with an average annual yield of \$20,000. The placers, particularly the deep ones, are not by any means exhausted, and experienced miners tell of many locations where pay dirt exists in great quantities and only requires the introduction of water in order to produce a great deal of gold. But, unfortunately, the construction of a ditch would prove very expensive, as only the Rogue river itself is thought to be capable of supplying the required amount of fluid, and, in case its supplies were drawn upon, a ditch fully 50 miles long would be required. Should it be built, it will render productive some hundreds or perhaps thousands of acres of auriferous gravel lying upon Evans', Sardine, Grave, Wolf, Coyote, Jump-off-Joe and Whiskey creeks, and will transform the lonely region, where now a few dozen miners eke out an uncertain existence, into an active mining region. Within the domain of hydraulic mining there is hardly a more promising enterprise. The total number of placer miners in this part is about 80, half of whom are working on Grave creek.

As for quartz mines, this portion of Josephine possesses few of value. Only two, the Lucky Queen and the Esther, have ever been worked to any extent, while the latter only has ever paid expenses for even the shortest length of time.

The most noted placer mining localities in Josephine are in the southern part, lying upon those streams which flow into the Illinois river, being Althouse and Sucker creeks. Galice creek, likewise a most important district, is near the western edge of the county, the creek flowing into Rogue river 10 or 12 miles below the mouth of Jump-off-Joe creek.

The quartz mines of Galice creek embrace the Green and the Yank ledges, which are parallel, but totally dissimilar lodes.

The Green Mine.

Called also the Sugar Pine, was discovered 20 years ago, and has been worked more extensively, perhaps, than any other claim in Southern Oregon. The vein is in slate, extends nearly vertical, with a strike nearly north and south, and oblique through the country rock. The thickness of the vein varies from nothing to three feet, averaging perhaps seven inches. The vein matter is white, splintery quartz, accompanied by much talc, with occasional deposits of calc spar. The metallic constituents are chiefly iron pyrites, copper pyrites, and a very little galena, which last is regarded at the mine as an infallible indication of "pay rock." The sulphurets of copper and iron occasionally occur in large masses, forming a considerable part of the vein at the point, and these massive pyrites carry a very high percentage of gold, the assays of solid specimens of copper pyrites reaching \$2000 per ton. Part of the quartz assays from \$30 to \$30 per ton, a portion falling below \$20, and another portion, containing too little gold to pay for extracting, is waste rock. The workings include four tunnels, the longest 550 feet in length, and four aggregating over 1200 feet; a shaft 60 feet deep, a winze 65, and many yards of stopes. The amount of pay rock extracted has not much exceeded 1000 tons, whose yield probably averaged \$25 per ton, as worked in an arastra, with a loss of nearly all the rich sulphurets, of which but a small part was saved.

The Yank Ledge.

No greater quartz vein has ever been discovered than the Yank ledge which crosses the Rogue river, three miles below Galice creek. It is 250 feet thick, and has been traced for 20 or more miles, north and south. It is a contact vein, with a slate hanging wall, and hypopyenite on the foot. The vein matter is mainly a bluish quartz, colored by copper, which is plentiful, existing as copper pyrites, and near the surface there are oxidized compounds, such as chrysocolla, azurite, etc. The soluble salts of copper have coated the interior of lately constructed tunnels with a deposit over a quarter of an inch thick. Numerous wide crevices occur in the quartz which are mainly filled with a soft material containing much oxide of iron and resembling the "gouge" of ordinary veins. Assays of the quartz show from \$2 to \$36 per ton in gold and silver, with a small per cent of copper. A part of the vein is occupied by a shoot of heavy spar some 20 or more feet wide, which forms an important part

of the vein matter. This is not thought to carry valuable minerals.

Such is the magnitude of the vein that an immense sum of money must necessarily be expended in order to prospect it, and no one possessed of the requisite capital has as yet shown a sufficient interest in the matter to invest therein. It is quite within the domain of the possibilities that the great Yank ledge may be found to contain immensely valuable ores, and certainly the worth of the claims would be very great if only low grade rock existed. It will probably be many years before its value is demonstrated. Not far away—in fact within a league's distance—lies the Mammoth, another incredibly thick vein, which is exactly parallel with the Yank. Of it, less even is known than of its neighbor.

Southern Josephine.

The mines of Southern Josephine form the chief resources of the people of that isolated but pleasant locality. In former times much placer work was done, which has left its traces in earthen hillsides, and creek and river beds turned topey-turvy. Some work of the sort is still done, and the average yearly product of the region may be reckoned at \$70,000 more or less. The best resource is the huge and endless gravel beds like those near Waldo, which are every year attracting more and more attention and will ultimately be worked on a scale befitting their importance and extent.

There is no means of knowing just how much auriferous gravel still remains to be washed, but it seems that if anything, the annual product from deep mines is increasing slightly, with a tolerable chance of a more rapid increase for the immediate future. There is opportunity for large hydraulic operations similar to those of California, with the unquestionable advantage of having ample ground on which debris may be dumped without injuring anybody. No debris law will ever afflict the mines of this State. We will advert to the topic of the extent of placer deposits in another connection.

Quartz mining has been even less a permanent interest than in the northern part of the country. A few mines have been opened, one only with encouraging results. Thus, the Enterprise mine, east of Waldo, has an 18-inch vein in quartzite, the quartz yielding \$26 per ton in the arastra.

MINING IS LEGITIMATE.—Mining for any of the metals is just as legitimate as any other occupation pursued by man. Mining after any method is legitimate. There is no law in the civilized world and there is no decree of any court among civilized people which declares mining by any method to be illegitimate. Any occupation followed by man is legitimate as long as such occupation is not forbidden by authority of the law. Mining needs no law to establish its legitimacy; no more than farming does, no more than shoemaking or tailoring does. And no decision of any court has declared hydraulic mining to be illegitimate. But the courts do say that hydraulic mining has injured lands and farms, and that the injury must stop. The Temple decision does not say that the mining must stop, but that the mining can be legitimately carried on when it is done without injury. The Sawyer decision says the same thing, only that Sawyer, the man, goes to the extent of saying that hydraulic mining cannot be done without doing great injury to private owners below the mining and to the streams and water-courses that are of use to the public. It is the injury that is decided against by both Temple and Sawyer, and not against the mining itself. Hydraulic mining is not, according to the courts, bad in itself, but results in badness, which is to be prohibited. That mining is not *malum in se* but is *malum prohibitum*, as the Latin of the lawyers would have it. Our contention is that quartz mining does not do as much harm, in making debris deposit, as farming. It is not an evil to be prohibited and the courts cannot and will not try to stop quartz mining.—*Foothill Tidings*.

THE MINES OF THE MOTHER LODE.—Considerable activity is being shown among the quartz mines running along the mother lode in the vicinity of Rawhide and Jamestown, Trolnolme county. It is reported that capitalists have taken hold of what is known as Rawhide No. 2, and will push the work of development at once. The next claim on the lode south is the Alabama. A few days ago a fine body of ore was found in this mine on the western slope. A vein four feet in width was developed, which shows a good quality of free gold and promises to yield a handsome profit. Next south is the Crystalline claim, which is being steadily worked. Then comes the Gem. A large amount of ore is already on the dump that has been piled up recently for the want of water. This mine has paid a large sum to its owner, and the ore now ready to be worked will add materially to the aggregate. There are several other claims along this great mother lode in which, sooner or later, will be found untold wealth. There is a large field in this section for enterprise. The time will come when proper development will open up the various veins and leaders that form a network until at a depth will be found rich and lasting mines. The work thus far has not gone beyond what is termed as surface work. Now that attention of leading mining men is being attracted to California, since the breaking down of mines in other States and Territories, they certainly should give the mother lode, with its many branches, a proper consideration. Its possibilities are great.—*Union-Democrat*.

Old Mexican Mines.

Not so Rich as Reported.

Many of the mining papers, says the *Denver Tribune-Republican*, are quoting a remark attributed to Sir Charles Lyell, the eminent geologist, which is that "the interior of Mexico is the richest known argentiferous section in the whole world." Something very similar to this is also said to have been stated by Humboldt. Romancers, of high and low degree, have played upon the same string until the whole world has come to believe that Sir Charles Lyell's remark is true. Even among financiers the possible wealth of Mexico in silver is said to be feared as a thing which may demoralize all calculations regarding silver supplies and silver coinage. The very truthful statement is made that the Spaniards worked out only the surface of the veins, ceasing operations when water was reached; that with crude methods of mining and smelting they produced two or three billion ounces of silver in 200 years, and from these facts they argue that with modern methods and modern machinery the same veins at greater depth can be made to yield more abundantly than ever, and to flood the world with the white metal.

The argument looks plausible, but it is based upon false premises. Not infrequently one finds the old gray-headed and erroneous statement that as mines increase in richness with depth, the abandoned Mexican mines will yield more largely below the water level than they yielded above. The fact is, the Spanish adventurers who visited Mexico with a cross in one hand and a sword in the other to gather silver for Christ's sake, got the cream, as those who get the ore near the surface generally do. Their crude methods of mining and ore treatment were the best possible methods under the circumstances. They mined exclusively with slave labor, the slaves raising the corn and vegetables upon which they subsisted. As the conquered natives furnished the slaves, the cost of mining was merely nominal, and whatever was produced was very near all profit. It is quite apparent that these are advantages which enabled them to work remarkably low-grade ore, advantages that cannot be obtained at this day.

As for the smelting processes, an examination of many of their slags showed that they understood their business and did work of which a modern metallurgist would not be ashamed.

Years ago the writer read those stories which fire the imagination, and as a result sought for that wondrous wealth along the Cordillera of Anahuac through the interior of Mexico, as well as where the golden-roofed palm looks out on the blue waters of the Caribbean sea, and the rustling cocoanuts grow on the shore of the Pacific, and he found no evidence of wondrous silver wealth. Many and many an old abandoned Spanish mine was explored as far as practicable, and no rich ore was found. Many a dump pile was carefully searched for a grain, a trace of rich ore, and scarcely any was found which would be called pay ore in Colorado. The conclusion was inevitable that the general run of the ore worked had been low grade.

To-day nearly all the mines worked in Mexico are lodes which were never touched by the Spaniards. The old mines were worked for from 500 to 800 feet in depth, and there are few of them which give any promise of paying well enough to warrant the erection of machinery. To-day a Mexican can build an adobe furnace and smelt ore at from \$5.50 to \$6.50 per ton, and they do good work. By the patio process he can and does work ore at from \$5.75 to \$7 per ton, saving 92 per cent of its value. The old mines, whose standing ores can be mined cheaply, cannot furnish ores which will pay even these prices for working.

There are rich mines in Mexico, no doubt, some of which are undiscovered, but that it is "the richest known argentiferous section in the whole world" is a statement not substantiated by well-known facts. No man must suppose that the Mexicans are a race of people who would allow such riches to lie idle and undeveloped. American miners could learn something from them, and the lessons would often be worth a good deal of money. They could especially learn something about mining laws. There are never any vexatious and costly suits there about apex and side lines, and the great majority of failures are made by those who undertake to use the modern machinery and modern methods of mining and milling.

FASCINATIONS OF MINING.—Wood River Times: Mining is fascinating. Most men have the common trait of thinking their trade or profession the most onerous of all occupations. But who ever saw a miner that did not consider his business the most alluring way of earning a winter grub-stake? One honest miner, who had struck it rich enough to buy into a mercantile house, said that 10 hours were never so short as when delving in the rocky tunnels, expecting each stroke to reveal the shining metal. This maddening scramble for the "almighty dollar" is an all-absorbing passion with us, anyhow.

EXTRACTING ALLUMINIUM.—It is stated that a company has been organized in San Francisco to extract aluminum from the extensive body of clay in the vicinity of Steamboat Springs, Washoe county, Nev. The metal possesses a commercial value of 75 cents per ounce. Its annual production throughout the world does not exceed 3400 ounces.

A Prospecting Tunnel.

The *Foothill Tidings* has already mentioned that Mr. W. H. Weldon, of Oakland, is in this place, and that he has, as is asserted, the title as derived from a United States patent to almost the whole of the ground located and possessed as mining ground by the Maryland Mining Company. In regard to that matter, the patent under which Mr. Weldon's company claims to hold, covers all the Maryland claim, excepting a few feet at the northwest end of the Maryland ground, and on that few feet of ground stands the Maryland Hoisting Works. The patent issued years ago to one Mock, covers four 40-acre lots, and lot 4, and the S. W. $\frac{1}{4}$ of N. E. $\frac{1}{4}$ of section 25, and the south $\frac{1}{4}$ of N. W. $\frac{1}{4}$ of section 25, all in township 16 north, range 8 east. As we understand, Mr. Weldon purchased the ground in question without knowing that the Maryland Company's mining ground was there located. He is disposed to be fair in the matter and has already made a proposition to the Maryland people, which is now under advisement.

And Mr. Weldon and his company have about inaugurated a tunnel scheme which is to be a very extensive enterprise. He has bought the right of way from parties holding titles in the northern portion of the town, for a tunnel. This right of way is for a distance of 3000 feet and runs due east and west. The right of way includes a depth of 300 feet below the surface of the ground and is 150 feet on each side of the median line of the tunnel—or the whole width of right of way is 300 feet.

Mr. Weldon will begin, right away, to sink a shaft on the George Murphy (or Harris) ground, in the northeastern part of town, near the Jewish cemetery. Lumber for the purpose is now on the ground. This shaft will go down 400 feet and from the bottom will run the tunnel in a direction due west. After a few months another shaft on the line of the proposed tunnel will be sunk in Reuben Thomas' ground, in the north part of town (Grass Valley elide), and from the bottom of that shaft work on the tunnel will be prosecuted both toward the east and to the west. The line of the tunnel will be pretty near the north line of the town as incorporated, and the tunnel is to go over into Benjamin Taylor's property to the northwest of the town.

The shaft on the Murphy ground will be sunk by hand power until the water level is reached, and then Mr. Weldon will put on extensive and efficient machinery for all the work to be done. Mr. Weldon has purchased the interest of Mr. George Murphy in the Mascot mine and all the machinery of the Mascot.

The object of running this tunnel is to see what is underground, and to cut quartz ledges and discover beds of gold-bearing gravel. The company has an abundance of money to carry out the enterprise, including payments for right of way and for the purchase of all real estate that may be needed.

Fissure Veins, or Deposits.

The most important mining litigation ever tried in Colorado was concluded in the United States Circuit Court to-day, says a Denver dispatch of Dec. 23d. A million dollars devolved on the result of the trial and a precedent set which involves the title to nearly 500 mining claims in the vicinity of Aspen, Pitkin county, Colorado. The question at issue was whether the Aspen mines contained fissure veins or deposits of ore. If the fissure theory was correct, then the owners of the claims on the apex, or where the outcropping was visible on the surface, had a right under the United States statute to follow the dip of the vein into other claims. But if the deposit theory was maintained, then a vast number of mines on the side of Aspen mountain could be operated by their owners as far as the boundaries of their claims. The present suit was brought by D. M. Hyman, of Cincinnati, against J. B. Wheeler, of New York City, and other capitalists. Hyman owns the Durant mine, an apex claim, and Wheeler and friends own the Emma mine, which lies immediately beneath the Durant, on the side of the Aspen mines. The Durant is the older location, but rich ore was first struck in the Emma; \$1,800,000 worth of ore had been taken out of the Emma when the Durant people brought suit to gain possession of the Emma on the apex theory, and the court enjoined the Emma from further operations. The case has been on trial three weeks, the best known mining experts in the West being about equally divided on each side. To-night the jury brought in a verdict in favor of the Durant mine. The Aspen mine, the richest in camp, lies immediately beneath the Emma, and suit is now pending to obtain possession by the Durant people. Two million dollars have been taken from the Aspen mine and as much more was in sight when work on it was enjoined. Other apex owners have been awaiting the result of this trial, and will now bring suit to recover possession of those mining claims lying on the mountain-side below them. This is the first case involving the apex theory tried in Colorado since the Leadville litigation was begun in the early history of that camp, and which was settled about three months ago in the Supreme Court of the United States against the apex theory. In the Leadville cases the hanging wall was claimed to be porphyry and the footwall limestone. In the Aspen case it is claimed that the hanging wall is of calcite and the footwall limestone.

Iron Ores in America and Europe.

A few years ago the idea that there ever would or could be a dearth of iron ores in the world would have been considered ridiculous. Possibly if we were to confine the remark to iron alone, exclusive of steel, the statement even now might be regarded as utterly improbable. But since steel has so largely usurped the place of iron and become the metal in very large demand, the question has assumed a grave phase, for the reason that ores suitable for the production of steel by the Bessemer process are much more rare than those for the production of iron, and ironmasters, especially in Europe, are already beginning to be seriously alarmed at the prospect of an early dearth in steel-producing ores.

In our last issue brief reference was made to this matter, and the opinion of Mr. J. T. Smith, general manager of the Hematite Iron and Steel Company, of Barrow, England—good authority—was given, wherein he remarked that he "was convinced that there was not a very long future before us (England) when the demand for hematite ore would be beyond the capabilities of this or any other country to produce." Reference was also made to the statement put forth on good authority that the "hematite ores of Spain, the chief source of European supply, and from which mines this country also imports over half a million tons a year, were fast being exhausted, and that the whole world was being ransacked for a possible future supply." No doubt this remark is quite correct, for the only known deposits of Bessemer steel ores from which Europe obtains its supply are those already referred to at Bilbao and localities of lesser note in Spain, which are said to be fast becoming exhausted, and comparatively limited deposits in Algeria and on the island of Elba. It is no wonder, in view of this fact, that much uneasiness exists in regard to the future of steel in Europe and that most anxious search is being made for other deposits.

We have since noticed a statement from Dr. Percy, the veteran English metallurgist, to the effect that within a few years the United States would also, very probably, experience considerable difficulty in meeting their requirements for high-class Bessemer ores." He further remarks that "The known quantity of such ores in the United States is far from abundant, and the same is true of ores, suitable for the basic process." He gives as one reason for his belief that such is the case, the fact that "Bessemer steel-makers in the United States have been compelled to search for foreign supplies of such ores." That "they are now importing large quantities annually from Europe," and that the import in the course of the next two or three years will probably amount to two million tons annually! That would be an increase of about three times our present annual importation, and equal to one-half of our present annual consumption of such ores.

Such a statement, coming from such high authority as Dr. Percy, is indeed somewhat startling, especially in view of the present enormous consumption of steel and iron in this country, and the rapid increase of that consumption. It should be borne in mind by the reader that the United States already consumes one-fourth of all the pig iron, and fully one-third of all the steel produced in the world!

Steel Ore Deposits in this Country.

Our European friends may confidently dismiss their fears in regard to the future of steel, even so far as the world is concerned. Notwithstanding the United States is just now importing large quantities of such ores from Europe, it is not for the reason that they cannot be had in sufficient abundance here, or of the desired quality.

The matter of transportation is just now the chief factor in the way of a full supply of native ores for our furnaces. The sudden and unexpected increase in the demand for steel has made it evident that the geographical distribution of our ores does not properly correspond with the location of our furnaces. It is for this reason that it is found more economical to obtain a large portion of the supply of ores, especially for our Eastern furnaces, from Spain. The large demand on this side of the Atlantic for wheat tonnage, and the small amount of our importations from Europe, make eastward freights very low. In fact, ships are almost willing to bring iron ore to New York as ballast. When our deposits of high-grade ore are more thoroughly opened, and transportation facilities better and more extensively provided for, our Eastern furnaces will have no occasion to look to Europe for their ores. The magnetites of New York and New Jersey, the Cornwall ores of Pennsylvania and the rich and abundant ores of Alabama, Tennessee, and other Southern localities, will soon furnish a full supply for the Eastern furnaces; while the inexhaustible deposits of Missouri and the great Colorado Basin can furnish any output which may be demanded for the central portions of the Union. There is a metalliferous belt east of the Alleghenies and entirely separate from the Pennsylvania deposits on the western slope of these mountains, commencing in Eastern New York and extending thence through New Jersey, Eastern Pennsylvania, North Carolina, and so on to Alabama, which is generally sufficiently free from phosphorus to work well for Bessemer pig iron, and which there is good

reason to suppose will soon be found of suitable quality for making Bessemer steel. It is too early yet to tell definitely what this belt may yet produce. The great deposit at Lehigh, Penn., was never formerly thought to be what it is now known to be. In addition to all these resources, we have the still greater and immeasurable deposits running all along the southern shores of Lake Superior, from Michigan to—nobody knows how far west. The Menominee and Marquette regions; the notable Vermilion mines of Minnesota, and the lately opened Gogebio range within 15 miles of a shipping point on Lake Superior, are capable of supplying the whole world for ages with Bessemer ore. Extensive docks have already been built on Lake Superior to accommodate shipments from the latter locality, and the most active work is going on in railroad construction, to meet at an early day the immense drafts which are expected soon to be made upon these deposits. The present means of transportation, though very great, are far from being able to answer the demand already being made by the furnaces along the lower lake shores. Probably not much short of 3,000,000 tons of Bessemer grade ore may be obtained from this locality during the coming year, and near twice the amount of all grades. So far from being unable to supply ores for our own consumption, there is much reason to believe that the time will soon come when the United States will be called upon to supply Europe, not only with the higher grade qualities of ores, but also with the larger part of the steel which will be required for her railroads and machinery. The wealth of the United States in iron and coal is absolutely inexhaustible, and if need be, will be able to answer the immense calls for those products which must eventually come from the future civilization of Asia and Africa, should those countries, on more thorough exploration, be found deficient in the home supply of those two necessary adjuncts to modern civilization. The needs of our own furnaces are now about 4,000,000 tons annually for Bessemer ore and 6,000,000 to 7,000,000 for pig iron, and this demand is rapidly increasing. It is estimated that within 10 years there will be required upward of 20,000,000 tons of ore of all kinds annually to supply the furnace demand for our own consumption of iron and steel. The amount of money and labor involved in handling, transporting, smelting and manufacturing into merchantable products this prodigious amount of material is almost past comprehension. These ores are now worth at the furnaces where they are required a general average of from \$5 to \$6 a ton.

One of the most rapidly increasing demands for pig iron at this time is for the manufacture of piping for conveying water. The rapidly-growing towns are constantly calling for new water-works or the extension of old. It is said that nothing like the present demand has ever before been known. This, in connection with always improving demand for iron for machinery, is likely to keep up the increasing demand for pig iron. This great demand for both iron and steel has come to stay. It is one of the necessities of the growth of the country and the advance of civilization.

A TUNNEL AND A WELL.—The taking of testimony in the case of Harriet Dower vs. Philip Richards, which had been on trial all the week in the Superior Court, was not concluded till late Saturday afternoon. The argument of counsel lasted but an hour and a quarter, and was confined solely to law points. The case went to the jury and a verdict for defendant was returned. The Dower family were running a tunnel under Mr. Richards' town lot, whereupon he sued in the Superior Court for an injunction, which was refused. By appealing to the Supreme Court he obtained a reversal of this decision. Pending the action of the Supreme Court, the Dowers continued driving the tunnel and drained Richards' well of water. The latter put a bulkhead in the tunnel, and thus again diverted the water to the well. In consequence of so interfering with the tunnel, suit for damages in the sum of \$8015 was brought against him, and this is the case he won Saturday night. Plaintiff claimed that the ledge for the development of which the tunnel was run was known to exist and had been properly located prior to the issuance of the townsite patent by the Government.—*Nevada Transcript*.

CALIFORNIA AND ENGLISH MINE BOYERS.—A correspondent of the *Reno Gazette*, writing from Sierra City, in this State, says: I want to call your attention to a matter that I have pondered a good deal lately: What is the matter with California mining capitalists? It has almost passed into a proverb here that it is no use to try to get an American to look at a mine. The English are the owners now of many of the best mines of this State, and are steadily buying. An English company recently purchased the Alaska mine at Pike City; another company is now laying plans to open the Gibsonville channel, and so it goes. Look at the names of the incorporators of the Phoenix; not a name that is not German. Why is this? With millions of dollars of idle capital, why do the business men of America stand back and allow foreigners to reap the most golden harvest that will be gathered from our mines? I confess I don't understand it. I know of men who have roamed this State all over in search of mines, yet have never made a purchase, but some Englishman comes after and gathers them in. These facts are no credit to our moneyed men.

A Miner's Ideas.

A correspondent of the Prescott (Arizona) *Courier* says: For some time past I have been visiting mining camps in Arizona, and wherever I go I find tons of low-grade ore on the various dumps, the product of labor that is almost entirely lost for the want of a practical, inexpensive way of reducing the same to bullion. I also find in all the principal camps stamp mills and smelters, with roasters, concentrators and all kinds of machinery for working ore, lying idle, not because there is no ore to work, but because the processes are too expensive to work the ore. I also find many mines worked to a certain depth and then patented, because as they go down on the ledges the ore becomes base. The old buildings tell the story of the removal of machinery sold at ruinous figures to be put up in some other place to again come under the auctioneer's hammer. Companies start out with the idea that a mine can stand all kinds of needless expenses and yet pay large dividends, that you can put some dude in as superintendent who doesn't know ore from charcoal, and when ruin stares them in the face, vent their spleen on the mine and the country in general.

The result of all this fool work is that our prospectors are disheartened living on short allowances of bacon and beans, doing just work enough to hold their claims waiting for a boom, and many of them are almost hopelessly in debt, and this works disaster on every other business pursuit. Legitimate business grows and meets and overcomes all obstacles with comparative ease, and there is no business that man can pursue and is without competition that is more honorable and legitimate than mining. The principal business of Arizona must be honest mining and the reduction of the ore into bullion. Upon this all other business must depend. The older States and Territories all have a home market to depend on, and if our mines were to-day worked with vigor, the ore reduced to bullion, we would have a market for all the beef and products of our ranches right here among ourselves, retaining within the Territory the money now paid to railroads for transportation of products to other markets. It is useless for the people of Arizona to wait for some one to come and create a boom, a tidal wave of prosperity that will land us in the lap of luxury and ease. Capitalists are like hogs fishing—if they see one catch a fish all will try to put their hooks in the same place. They who try to paddle their own canoe will get some one to help him sooner than he who waits for some one to paddle it for him. I believe that co-operative effort will place a steel-lined water-jacket smelter, with dust condenser, in each camp, and that by mining the ore produced by the mines within the district all our obstacles will be removed, that each and every miner will work himself out of debt and create a lasting, healthy, prosperous business, and by so doing Arizona will grow into a State and occupy her rightful place in the Republic.

The Mill Creek Purchase.

Relative to the purchase, by a London syndicate, of a group of mines at Mill Creek, Mono county, Cal., about 30 miles south of Bodie, the *Dayton News-Reporter* says: Like all mining camps, Lundy or Mill Creek has had its up and downs, and for the past two years has been practically dead. There is but one mine in the camp upon which any practical work has been done—the May Lundy. That mine has been "expedited" times without number, and there never was anything but a favorable report made upon it. It has, however, been grossly mismanaged, and finally its affairs got into the courts and became so tangled up that it was closed down two years ago. Those who ought to know say that other claims in the district are more promising than ever the May Lundy was. These claims are included in the recent purchase, and as the syndicate purchasing them is very wealthy—its capital stock is \$5,000,000—they will probably be systematically worked.

There are men in Lundy who have been there 20 years, "waiting till the clouds roll by," satisfied that the claims that they have been so long doing assessment work upon would make them wealthy. This reporter is of the opinion that Homer district will prove the richest gold field ever discovered. When once its merits are known that district will have a "boom" unequaled since the "days of '49." If the enterprise of the syndicate that has gone into the camp is equal to its capital, the "boom" is not far distant.

CONCENTRATORS SHUT DOWN.—It is reported in Empire that all the concentrators on the Carson river, except those in use at the Mexican mill, will be closed and a full force of men put to work. The ore will be worked by the old process. Whether the concentrators are a failure or not is not stated. It is more than probable that the richer ore now being extracted cannot be treated profitably by concentrators, owing to the large percentage of chloride it carries. It has never been claimed by the inventor of the concentrators in use on the Carson river that chlorides could be saved by them; hence the suspicion. The treatment of ore under the old regime will give employment to a much larger force of men, and consequently increase the payroll considerably.—*Carson Index*.

No Abandoned Mines at Grass Valley.

There are no abandoned mines in Grass Valley. There are no abandoned claims to quartz ledges, which are not mines but are owned and held for the purpose of making mines upon them. In many instances if claims, or even mines were abandoned, so that relocation could be made, the district would be all the better off and more prosperous. Then men would take hold of the claims, or even mines, who could and would do work. Of course the *Herald* inadvertently used the too-strong word "abandoned" in the above-quoted remarks. Idle claims and idle mines abound. Most of these are held at high figures—too high in most instances. There is the old Allison Ranch, for instance, that is "abandoned" just as the Wyoming mine was. The Allison, in the southern part of the district, stands there idle, with gold by millions in her bowels out of which millions of gold has been taken, and yet it will take more than a 40-foot pole to touch that idle Allison Ranch mine—it will take big money to owners to do away with the present idleness. The St. John (Knights of Malta) is another idle fellow in the northern part of the district, and between Allison Ranch and St. John are many idle, but not abandoned, mines. Water power, however, is going to start up very many, and has started some. The Badger is one of these that has lately felt the stimulating power of water, and the Badger, as our lamented friend, J. W. Gashwiler, used to say of the Idaho mine, "she sits like a duck on the water; she is the genuine 'chawed' rosin." And water is going after old Allison Ranch, they say, and the water will be piped from the North Star to that Ranch, the same water thus being used for power three times: at the Empire, at North Star and at the Allison Ranch. No, in Grass Valley there are no abandoned mines, and in a very short while there will be no idle mines, and before another year rolls by mines will be made down into what are now idle gold-bearing quartz ledges. And all this reminds us that Grass Valley is not a "mining camp," but is a permanent town, and will be here two centuries from now, and then be yielding gold and growing the finest temperate zone fruits that can be raised on top of the earth.—*Grass Valley Tidings*.

ANCIENT DEPOSITS.—In the shaft of the Centennial gravel gold mine, 235 feet below the surface, chips and sticks of wood are found amid a sedimentary formation, showing that an ancient river had passed through there. River sand and smooth washed quartz pebbles were found beneath, and finally the bottom of the shaft, 250 feet from the surface, was in solid lava, some declaring that it was bedrock. With new machinery, work was resumed recently, and the shaft, in sinking deeper, passed through the lava streak into another sedimentary deposit. These deposits are considered to overlie the true gravel channel or river bed. The *Nevada Transcript* says: There were at the Citizens' bank yesterday some petrifications taken out of the Centennial drift mine of Washington Township, at a depth of 300 feet below the surface. They were deposited in the miocene age, and consisted of cycad (now extinct) alder and other leaves, beside several kinds of wood. The imprint of the leaves and wood grains are distinctly shown in the specimens.

BUY UNDEVELOPED PROPERTIES.—Just now while there seems to be a flurry among mine investors we stop in our mad career to remark that the man who wishes to invest in mining should visit the various mining sections and buy undeveloped properties. It is very seldom that high-priced mines bring much profit to the purchaser. Three-fourths of the money made in legitimate mining enterprises is made by those who develop mines. The clear profit arises from increased value, and then there is little risk, as promising prospects can be bought for a song; about all the risk to be taken is the money spent in development, which in no case should exceed one-twentieth the cost of a good mine. If you would make money in mining, buy prospects and develop them, but don't buy them by the acre or square mile, or by the "group;" buy every individual claim on its individual merits. Groups are frauds in nine cases out of ten.—*Elk Mt. Pilot*.

GOLD DIGGINGS.—A hatch of old prospectors paid a visit to defunct claims between the Sutor tunnel and Six-Mile canyon, and fondly imagine they have struck a gravel bed. Some of the stuff was panned out by an old expert and found to be considerably auriferous, and before this issue of the *Tribune* is circulated, the business will be fixed as far as location is concerned. All around Mt. Davidson, gold-bearing gravel is found, and on the west side of Washoe lake a veritable gold lead has been discovered, which will be either ground-sluiced or hydraulicked the coming spring.—*Carson Tribune*.

ORE REDUCTION.—The English mill, near Reno, having been purchased by competent parties, is being put in complete order and condition for the reduction of ores by any required process—smelting, chlorination or leaching. It will probably not be so much of a custom mill as for the reduction of ore in large runs, some one mine, for instance, supplying it for weeks or months at a time.

SAN FRANCISCO:

Saturday Morning, Jan. 1, 1887

TABLE OF CONTENTS.

EDITORIALS.—Huson's Wire-Rope Tramway for Mines; "Fine" vs. "Find," 1. Passing Events; Investing in California Gold Mines; The Mining Industry; Volume LIV; A Happy New Year, 4. Fuel and Boilers; Mining Accidents; California Copper, 5.

ILLUSTRATIONS.—Huson Tramway at Payrock Mine, Silver Plume, Colorado, 1. Fig. 1—Upper Terminal of Huson Tramway; Fig. 2—Lower Terminal, Showing Automatic Dumper, 5.

MISCELLANEOUS.—Oregon Mines; Old Mexican Mines; A Prospecting Tunnel, 2. Iron Ores in America and Europe; A Miner's Ideas; The Mill Creek Purchase; No Abandoned Mines in Grass Valley, 3.

MECHANICAL PROGRESS.—Progress of Mechanical Science; Designing Machinery with Regard to Repairs; Failure of English Engines in Russia; Paraffine as a Lubricant; Immense Steel Castings, 6.

SCIENTIFIC PROGRESS.—A Dangerous Locality; Antiquity of Man in the United States; Improved Observation Instrument; Interesting Catalogue of Meteors; Force of Explosives; Electrical Transmission of Energy; Druidical Remains in Peru; A Mushroom Developed in Human Saliva; Alloy of Aluminum and Tin; Photographing Cannon Balls; Life and Death, 6.

USEFUL INFORMATION.—Rouge for Polishing Metals; Curious Facts Regarding "Rich" Mortar; Shooting Out a Fire; A New System of Puddling Reservoirs, Etc.; Perfume from Faded Roses; Force of Habit; To Cleanse Glass Globes, 7.

GOOD HEALTH.—Pasteur's Hydrophobia Cure; The Danger of Kissing; Hints on Eating Fruit; A New Disinfectant; Earth Infections; Coffee and Egg for Sick Persons, 7.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 8-9.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 12.

Passing Events.

The PRESS being dated this week January 1, 1887, it is proper for us to wish all of our patrons a Happy New Year, which we do with great good will, and hope to have them with us for many succeeding years.

Light showers have fallen all over the State during the week, but the rainfall is by no means, so far, as much as is wanted.

Trouble with the cable railroad strikes in this city still continues, and some riotous actions have been carried on. There is talk of a general tieup on all the lines, though the men on some of the cable systems are perfectly satisfied with their hours and pay.

It is noticeable that there are at present in California a number of men who are on the lookout to purchase gold properties. It is to be hoped that they will be able to procure what they desire and excessive prices for claims will not prevent their principals from investing here. Every well-equipped mine in a camp is a great assistance to it. Any good company which is operating extensively is a great encouragement for others to commence work. It is therefore well for miners to do what they can to get these investors to purchase and settle in their neighborhood.

The Plymouth Consolidated Mining Company will pay its 44th dividend of 25c per share on the 5th of January. The amount is \$25,000. This is the first dividend announced for the new year.

A COAL MINE has been discovered at Napavine, Washington Territory. The vein is 50 feet in the ground, and is said to be equal to the Pennsylvania product.

Investing in California Gold Mines.

There appears to be just now a good deal of inquiry on behalf of parties abroad for gold mines in California. These inquiries come sometimes through mining experts and agents visiting the State in the interest of foreign capital and sometimes through business and moneyed men coming here for the purpose of looking about and surveying the field for themselves. Of this class of investors or their representatives the number now in California is unusually large, the advent of winter having caused many of them to hasten their departure from the mining regions lying to the north and east of us, where they had before been spending some time with the same end in view. Escaping from the deep snows in the mountains of Colorado and the arctic temperature of Idaho and Montana, they are the better able to appreciate the advantages of our winter climate for mining purposes. The countries they left are deeply buried under the snow even thus early in the winter, the streams being ice-bound and the ground everywhere frozen to a depth of many inches. The wagon roads, the railway over there, are, at all considerable altitudes, blocked with snow, impeding not only ore transportation, but greatly hindering all other branches of business. Owing to these causes the mines and reduction works in the more elevated districts are shut down during this season of the year, the snowslides that occur there always endangering and often destroying the lives of the workmen, rendering this the more necessary. An almost total absence here of these difficulties, dangers and drawbacks is enough to place California a long way ahead of her neighbors, were there nothing else to give her pre-eminence as a mining country. When to this, however, is added her many other advantages, natural or acquired, we feel to congratulate our visitors on having come to a region offering such special inducements for the investment of capital in the business of gold and silver mining.

Being here on such a laudable errand, a few suggestions by us tending to its furtherance will not, we trust, be considered out of place. And first, we remark that while we have here the deposits of the precious metals in countless numbers, of every degree of value and in all stages of development, it will be no easy matter to find a property that, coming fully up to the requirements of those Eastern investors, can be bought for a very small sum. Generally, we observe that the principals in most of these cases want what the English term "a going concern"—that is, a mine opened, equipped with plant, and making a profitable production. We have many mines of that kind in California, and, while they are not exactly on the market, they can almost always be bought at a moderate price. For this there are a variety of reasons. Often the owners of such properties have been long in the mines, and, growing old, would like to get out and enjoy a portion of the residue of life left to them elsewhere. Or these men may be the owners of other undeveloped claims and be anxious to sell an improved mine in order to obtain means for opening up these other claims, some of which, it is believed, can be worked up into properties of large values. Frequently men of ample means will, in like manner, sell "a going concern" at what to the purchaser would be a great bargain, simply for the reason that the owners well know that they can, because of their great experience in the business, and the superior facilities they enjoy for its prosecution, soon work up a virgin claim into a mine quite as valuable as the one they have disposed of, and at a cost vastly less than the price realized for the latter.

But while this is all true, we incline to think that this class of investors would find it expedient to so far relax the above rule as to accept of but partially-developed mines, and even what may be considered good prospects, being such properties as have little or no plant upon them, but which make a fair showing of ore, coupled with other features and indications of value. Of these properties there is no lack in California. They abound in every district, from one end of our gold fields to the other, and as a rule, they can be bought for very little ready cash, ample time being given for their further exploration, where this is required. The reduced price at which these claims can be bought more than offsets the additional risk taken by the purchaser, who, with his larger

means, more skillfully applied, can further exploit the deposit in a more effectual manner and at less expense than could have been done by the original holder.

Under the guidance and advice of a really good expert, the risk incurred in pursuing the course here suggested is very small—not greater than has to be taken in any other, even the safest business we know of. This is certainly the case here in California, where, of course, the hazard attendant on mining ventures has been reduced to a minimum. That the conditions here, everything considered, are more favorable for such an undertaking, will, we think, be conceded by all who have any knowledge and proper appreciation of their character.

What we have here said is merely suggestive. We consider these, our visitors, somewhat in the character of guests. Hence these hints, which we trust will prove timely and helpful.

The Mining Industry.

The annual value of the mineral products of the United States is about \$425,000,000, and some \$800,000,000 are invested in the business. Mining furnishes employment in this country to 500,000 men. In Montana alone, the newest mining country, 50,000 people are dependent on silver and gold mining. Leadville has produced \$114,000,000 and is good for many times that much. The production of California alone in the aggregate runs far beyond a billion of dollars. Nevada has yielded her hundreds of millions, and all the other States and Territories have produced their quota of riches.

Yet this industry is scarcely recognized by the Government. There is no department of mining, and no high officers of the Government to look after the industry. The States themselves do little, if anything, toward the industry. In California, the oldest of all the mining States, we have a State Mineralogist and State Mining Bureau, but the institution is poorly supported and has to fight for existence. It has never had any sufficient appropriation to carry out work that should be done. Even the mining department of the University lacks many necessary things to make it what it should be.

It seems strange that no more attention is paid to this industry by the State and General Governments. One so productive as it is yearly shown to be, employing so much capital and so many men, would seem to demand close attention and careful fostering. Other countries do this on a mining basis much less important than ours. Our Government has a Mint Director, who is supposed to give some attention to precious-metal mines; but the reports are disappointing and of little statistical value, as far as the mines themselves are concerned. The U. S. Geological Survey has a Department of Mineral Statistics which gets up the best reports we have; but even in that the amount set aside is too small to carry on the work as it should be done.

The owners themselves are not men who have much political influence. Whatever grievances they have they say little about, and, as a class, they are not apt to press their claims. Perhaps in course of time the people of this country will begin to realize the value of the mining industry more than they do now, when better measures to foster the industry will be taken.

THE DEATH OF SENATOR JOHN A. LOGAN was sudden and unexpected, and removes another of the distinguished figures of the war. Though Logan had for some time been a conspicuous figure in the local politics of Illinois, he first came to the front as a national character during the Civil War. No one untrained in the military art made a better record. That he had the genius to command is the tribute of Gen. Grant, under whose eye the most of his gallant services were performed. At Champion Hill he covered himself with glory. At the storming of Vicksburg he evinced the most deliberate courage. With a major-general's commission he was appointed by the President to the command of the 15th Army Corps on the death of McPherson.

From the close of the war until 1871 he filled various positions of honor. That year he was elected United States Senator, and was serving his third term at the time of his death. In the last Presidential campaign he was second on the Republican ticket, and many of his friends and admirers predicted he would head the ticket in 1888. At the time of his death he was 61 years of age.

Volume LIV.

A new volume of the MINING AND SCIENTIFIC PRESS commences with this number. The PRESS is favorably known in every mining camp on the coast, and with the increase of the mining field has come an increase of its circulation and influence. During the coming year it is intended to improve the paper as much as possible. We have perfected facilities by which we shall be able to give more original illustrations than heretofore, and intend fully describing all the improved mining and metallurgical appliances as they come out. This feature is a very valuable one to our readers, as it enables them to see all the improvements which are made. Our correspondents who visit the various camps will send us descriptive letters from different regions. Our general weekly mining summary will be as replete with current news as usual. In mechanical, industrial and scientific matters we shall keep careful watch of all that is of interest and present it in condensed form to our readers.

We are always glad to receive from our readers any notes they may choose to send from their mining camps and towns. This information is always appreciated by the editors, and by subscribers. With the beginning of the volume we expect many renewals of subscriptions as usual. We would like our friends also to call the attention of others to the merits of the PRESS, with a view to their becoming constant readers. No one on this coast connected in any way with the business of legitimate mining can afford to be without the MINING AND SCIENTIFIC PRESS, which is devoted to the advancement of this industry. The oldest mining paper on the continent, its experience is valuable to its readers, and they may rest assured they will not find in its columns anything tending to advance questionable schemes of any kind. This has always been its reputation and a well-earned one. Our readers may rely upon it that the interest of the mining community will be looked after with care, and that we shall do all in our power to advance the industry we represent.

A Happy New Year.

The friendly greetings we toss so freely about at the opening of a new year have a beautiful meaning and value. They mean that we have, for once at least, risen so far above the narrow life of self as to wish others well. This is no small thing to do. When one can sincerely wish only good for all others, he has got beyond self and come into the great, warm life of humanity. He has conquered envy, envy and jealousy. This does not mean to overlook the wrongs and vices of others, for that would not be well-wishing. No greater evil can befall many people than to go on happy and content in their present way of life. It means when we can wish all others well, that we desire for them all honorable success and all proper enjoyment. There is a real value in this state of mind. It is a blessing to the one who possesses it as well as to others. It increases the joy of one who lives in that state, and it goes out in fragrant helpfulness and encouragement to all others. And how much we all need encouragement, and what a sweet inspiration there is in the thought that in the hurry of life we are not forgotten. Blessed will be the day when every human soul can say from the heart, "A Happy New Year!"

What a strange glow of enchantment always hangs over the dawn of a new year. We are not invited to move over old ground. The eye opens upon a new landscape and the ear bends to new music. There is no routine in real life. The external outlines may seem the same. We live in the same houses, do business in the same old office, shop, or store, and pass along the streets we have traveled for years; but the heart and mind do not remain the same. If the years are repetitions with any one, it is because the enthusiasm of the heart has been killed. Nature hates a stationary life as she does standing water. It is the activity of the ocean that makes its purity and cures the invalid who breathes its washed and filtered air. Hence the true soul is willing to let the past slip away, for the future is so fresh and new. So let every one make his calls, and pass around gaily his Happy New Year's greeting.

TOMBSTONE anticipates a revival of her mining industries the first of the year.

Liquid Fuel and Boilers.

In the article in the PRESS of last week on the subject of the use of liquid fuel, this fact was briefly mentioned that though it was supposed by some that the oil fuel was destructive to the boilers, this was not really the case. Mr. A. J. Stevens, the general master mechanic of the Southern Pacific Co., gives it as his candid opinion "that a boiler will last three times as long when burning oil as it would burning coal of any kind." He states, also, that "too much cannot be said in that direction." The following letter on this subject will be read with interest:

SOUTHERN PACIFIC CO. (PACIFIC SYSTEM),
SACRAMENTO, NOV. 18, 1886.
Geo. Loomis, Esq., President Pacific Coast Oil Company:

DEAR SIR: In reply to your letter of the 17th inst., we would state that the Southern Pacific Company used petroleum as fuel on the steamer Piedmont from September, 1885, to August, 1886; on the Solano from March, 1885, to August, 1886; and on the Thoroughfare from January, 1885, to August, 1886, and during that time the bills for repairs to boilers were very much less than during any corresponding period when coal was used for fuel. We consider the heat from petroleum fuel as much less destructive to iron, and therefore more desirable than the heat from coal. Yours,

A. J. STEVENS,
General Master Mechanic.
E. FOSTER,
Chief Engineer Solano.

These statements from such authorities as the gentlemen named embody an experience which is valuable. In California the question of the use of liquid fuel is an important one. We have plenty of petroleum, but very little coal. What coal is sold in this State brings a comparatively high price, and the further we get away from San Francisco the greater the cost.

If, therefore, we can utilize our home products to advantage in this connection, it will be a great saving to the community. In Southern California, where the main oil beds exist, more of this liquid fuel is used than here. The impression that its use is destructive to boilers prevails to more or less extent, statements to that effect having gone the rounds of the press. It would seem strange were this so here, since it has not been found to be the case in Russia, where liquid fuel is largely used. In the letter of Mr. Stevens, which was published last week, he says that "during the time the different boats were burning oil, we were not called upon to make repairs to the boilers; while with burning coal there is not a week when more or less repairs are not necessary."

From these remarks it will be seen that it is an erroneous idea to suppose that the liquid fuel is destructive to boilers, and that the contrary is the case. The opinions expressed are the result of experience with both kinds of fuel.

Mining Accidents.

Frank M. Chapman, a miner in the Grand Victory mine, El Dorado county, narrowly escaped being killed last Sunday, in consequence of the premature explosion of a blast. He, in company with other miners, had prepared several blasts in the large cut, and after touching the fuse started to run for the tunnel at one end of the cut. Before young Chapman could fortify himself he was completely showered with rock and dirt, and knocked unconscious at the mouth of the tunnel. His injuries are not of a fatal character. His clothing, it is said, was torn into shreds.

While working at the bottom of the shaft at the Mayflower mine, Placer county, David Samuels met with an accident. A timber about three feet in length fell from the third pumping station and striking the cage, bounded down directly on Mr. Samuels' head, cutting a fearful looking but not dangerous gash.

Last week, Arthur Davis, one of the engineers of the Raymond & Ely mine, Nevada, met with quite a severe accident; the hell-rope lever came down on his hand, crushing a couple of the fingers.

California Copper.

It was at one time thought that the copper interests of California would be very large, as a number of mines have been found at different times. We do not, however, produce over 800 or 1000 tons of copper a year, mainly from Nevada county. This is a very small quantity indeed, as compared with Montana or Arizona,

Fig. 2.—UPPER TERMINAL OF HUSON TRAMWAY.

which Territories now eclipse all the Pacific Coast region. The San Francisco Copper Company's mines, Nevada county, make most of the cement made here. More or less ore is, however, exported to England and to Baltimore to be worked.

There are numerous copper deposits in the State, very few of which are worked. Some of the pyrites mines of great magnitude will no doubt be utilized in the future, but at present very little is done.

During the era of high prices and scarcity of

around Copperopolis, and the result is that the company is taking up and buying all the copper mines to be found. The interested parties are now erecting improved works for reducing the ore, and will soon be sending pure copper to the markets of the world. The company claims that a profit can be readily made, with its modern appliances and methods, on ore that yields four or five per cent of metal. The ore

of the above-named mines is of a higher grade than the per cent stated.

Annual Mining Review.

In a few weeks we shall issue our annual mining review, giving a summary of operations of the various mining camps of the coast for the past year. We shall give the full product of the year and all the statistics obtainable. We shall be very glad to receive from any of our readers an account of the pro-

Fig. 3.—LOWER TERMINAL, SHOWING AUTOMATIC DUMPER.

labor in the East work was commenced here on a sort of speculative basis with the Copperopolis mines, Calaveras county, and there were a few years of growing productiveness. There was, however, no local market, and low-grade ore and high freights finally closed those mines down.

At the close of the war, when copper ruled low, the Copperopolis mines were deserted, and have remained so since. We see now, however, by the Stockton Mail, that a short time ago a Nevada company, which has been engaged in copper mining for years past, made an investigation of the Calaveras copper belt

ress of their camps or mines. Many camps have no newspaper to represent them, and the miners should choose some one to "write it up," in order to keep it before the public. We intend printing a large edition of the number of the PRESS which contains the review, which will appear within a few weeks, just as soon as the statistics are available. Send us what notes occur to you and we will put them in a shape for publication.

At Turner's shipyard, Benicia, three coasting schooners are being built, and work will soon be commenced on a brig.

Roasting and Leaching of Silver Ores.

Notes of the Practice at La Yedra, Sinaloa, Mexico.

[Written for the PRESS by CARL A. SCHENK.]

The property of the Anglo-Mexican Mining Company at La Yedra is situated near the northeast boundary line of the State of Sinaloa, in the heart of the Sierra Madre. It takes about five days' ride on horseback to come to the place from Culiacan, the capital of the State. From Mazatlan, the nearest important port on the Pacific, to Culiacan, two routes can be taken, either by stage, which takes about two days' ride, or by coast steamer to Altata, a small port at the mouth of the Culiacan river and by rail from Altata to Culiacan. The traveler saves time and money and has more comfort by taking the coast line route, provided the mail steamer from San Francisco or Panama arrives at Mazatlan in time to connect with the Altata boat.

Altata is the gulf terminus of the Sinaloa-Durango railroad, which is yet in its infancy, only about 40 miles having been finished over a level plain to the city of Culiacan, with no field work being done at present for its extension. Altata is also celebrated for its delicious oysters.

Approaching the camp from the Culiacan side, the sound of the stamps—the first sign again of a vigorous, go-ahead life—is heard long before the mill comes in sight. At last, in doubling a spur, we discover in a large hollow, drained by a narrow ravine and cut out by nature in the side of the mountain, being also leveled off to some extent by the hand of man, a group of large buildings, a monument of modern industrial life in Old Mexico, the reduction works of La Yedra. About half a mile higher up is the mine, of which we can just see the dump.

The Ore Obtained From this Mine

Consists of various minerals; the gangue is more or less crystalline lime-rock, containing also silicic acid; fahlore is the principal silver-bearing mineral, with a small percentage of ruby silver, and associated with these are granular misspickel and crystalline iron pyrites; also zincblende and very little galena. The ore is sorted at the mine, and only first-class, going over 50 ounces per ton in silver, delivered to the reduction works. Enough ore of such richness has been and can be obtained from the mine to keep the 40 stamps going. The ore is crushed dry, as it has to be roasted for the succeeding process of leaching. And even if amalgamation had been resorted to, roasting could not be dispensed with, as the ore is of a very rebellious nature.

The Furnaces.

The Bruckner revolving furnaces which were put up first not proving a success, long reverberatories were built and their number gradually increased to eight. They differ somewhat in construction in the number and position of hearths; in some furnaces all the hearths lie in one plane, no drop or step intervening between two joining ones, and yet each hearth is a separate part of the whole furnace, as appears from the internal construction, each one being moreover provided with its own working door. In others a perpendicular drop separates the planes of two joining hearths; one lies above the other, as step is joining step in a stairway. The number of hearths to a furnace varies from three to six, with one fireplace for the entire number combined in one furnace.

The working doors, one for each hearth, and also the door for the fireplace, are all on one side. Considering the length and breadth of each furnace, and the necessity of providing sufficient means for a good stirring and a rapid as well as clean displacement of the ore from hearth to hearth, the arrangement of working doors on opposite sides, which would not involve an increase in the number of furnaces, would be better. The separate hearths of each furnace are designated by numbers; hearth I is nearest to the fireplace, and in it the ore receives the finishing roast; then follow hearths 2, 3, etc., according to the number of hearths. In the last hearth, for instance, No. 5 of furnace II, which is farthest from the fireplace, the ore is dropped through a circular hole in its arch, which is closed, when not in use, by a cast-iron plate. From a wooden hopper directly above the arch the crushed raw ore drops on the floor of the hearth, forming there a low conical pile, the outlines of which can hardly be made out in the darkness, which at the beginning of the roasting of a new charge is observed in this part of the furnace.

[TO BE CONTINUED.]

Illustrations for 1887.

Having greatly improved our facilities for producing original engravings, the readers of the PRESS may anticipate greatly increased value in our issues for the ensuing year. With the awakening of new interest in many important mining fields, the vigorous pushing of new mining enterprises at home and abroad, and our determination to keep the PRESS in the lead of the mining journals of the world, our subscribers may rest assured that the coming volumes for 1887 will be more than usually valuable and profitable to its numerous and steadily-increasing patrons.

MECHANICAL PROGRESS.

Progress of Mechanical Science.

The following truthful and instructive words are an abstract from an address delivered before the section of Mechanical Science of the American Association for the Advancement of Science, at its late meeting at Buffalo, by O. Channet, of Kansas City: In marked contrast with the past, the present age is one of pronounced material development. Formerly the brightest and most gifted men devoted themselves to religion, philosophy, politics, exploration, art; but for the past hundred years the attention of leading men of the civilized world has been directed to increasing and cheapening those products which minister to the daily life and comfort of man. Farmers, mechanics and laborers live now more comfortably than did the middle classes of feudal times; the duration of human life has been materially lengthened, and all portions of society recognize the importance of further progress, and the advantage of organization and invention in securing it.

[This Era of Material Progress]

May he said to have commenced with the final perfecting of the steam engine, which, together with the various attendant machines, takes the place of hand and animal labor, which has increased and cheapened the production of the necessities and luxuries of life; and it has pushed the inventor and the engineer to the front rank in modern society. It may be useful to point out the absolute necessity of verbal and written intercourse between investigators and inventors, that the speculation and curiosity of the former may ripen into the effective invention of the latter. Nothing is more remarkable than the multitude of minds and facts which are required for the perfecting of even a simple machine, nor how little the least man may need to add to complete the invention. Facts and natural laws, known for years as curiosities, are taken up by some inventor, who fails in the attempt to render them of practical use; then a second genius lays hold, and profiting by the mistakes of the first, produces, at great cost, a working machine. Then comes the successful man, who works out the final practical design, and, whether making or losing a fortune, he yet permanently benefits mankind.

The Faculties of Invention and Discovery are generally separate. One set of men observe facts and deduce laws therefrom; and another set endeavor to turn the results of this observation and deduction to practical account in the production of labor-saving appliances. This section should be the place where these men may meet one another, and profit by the interchange of ideas. Many of the men whom I see before me are devoting their lives to the study of nature, with no desire to make money out of it, but simply to increase human knowledge; and some of their discoveries will eventually be put into practical shapes for the use and convenience of man. History proves, too, that the scientific observers have the safer and happier part. Their success may not be so dazzling as that of some great inventors, but they do not have to bear such bitter trials and disappointments. To deduce natural laws requires mental accuracy in observing and reasoning; to make them useful in doing the world's work requires imagination and ingenuity. Sometimes long years must pass, and generation after generation of inventors wear their lives out, before a needed machine becomes an accomplished success. Evidently, then, the greater the number of minds that can be brought to bear upon a particular problem, the greater is the chance of early success. I believe that it is the particular province of this section of the association to bring these two classes of minds together and to promote their intercourse, that the discoverer may learn in what direction fresh information is needed, and that the inventor may be advised as to what is already known.

The Well-Worn History of the Steam Engine

Gives us an instance of an invention which did not spring full-grown from the brain of the inventor. History informs us that it commenced to exist 200 years ago, in the eolipile of Hero of Alexandria. His treatise remained hidden until translated and printed in 1547; and then Branca, the Italian architect, constructed one for pounding drugs. Hero's hook ran through eight editions in different languages, and attracted the attention of a French inventor, who tried vainly to raise water by steam pressure. Then came the Marquis of Worcester, who died a disappointed man, after expending \$250,000. Then de Morland tried using steam in cylinders, instead of in contact with the water; Papin built a steamboat, only to have it seized and destroyed while on its way to England, and he, too, died broken-hearted and poor; Savery went back to using the steam directly in contact with water; and finally Newcomen built an engine that worked; and between 1705 and 1758 quite a number were erected. These engines had a duty of only 5,500,000 foot-pounds per pound of coal, the improvements of James Watt, an instrument maker, increasing the duty to 60,000,000.

My object in giving this sketch is to call your attention, first, to the gradual evolution of an invention by the process of exclusion, by finding out what would not do; and second, the apparent chain of connection, running for over a century, through several generations of invent-

ors, each evidently profiting by the failures of his predecessors, to the extent, at least, of avoiding their repetition. Is it not evident that the earlier inventors would have accomplished greater results had they had a larger range of scientific experiments and advice; and that Watt triumphed because he had the whole faculty of the University of Glasgow at his back, to give him knowledge of natural principles, and information as to what had been done? [So with numerous other inventions named—especially the steamboat, the locomotive, the telegraph, the sewing machine, the reaping machine, etc., each of which was referred to at greater or less length. In continuation, the speaker remarked that—]

Ordinary Technical Societies

Usually discourage speculative papers and discussions, and prefer to hear of accomplished facts; but the busy men who are developing this country need something more—they need to keep up with discovery before it is reduced to practical account, and they need that personal contact and sympathy with men of science which nothing can replace. Engineers, as well as other practical men, owe it to themselves to come to these meetings, bringing accounts of what they have done and hope to do, and especially what they have failed to do, and why; and some speculative papers may well be allowed providing always that they are on a sound basis and stick to facts; for how often is it that the imagined things of to-day become the accomplished results of to-morrow.

DESIGNING MACHINERY WITH REGARD TO REPAIRS.—The designing of machinery is a most important matter and one which should be studied with the utmost care in all its bearings. The matter of repairs is one of the first, if not the very first, which should be considered by the engineer. An engineer may build an engine, or any other piece of machinery, at the very lowest cost of construction, consistent with doing the work required of it, and with power and strength of parts to spare, giving the least possible consumption of coal—if an engine; or requiring the least possible power propulsion, if a machine, and on its being put to work it may very soon be made to appear that he has overlooked the most essential part, viz., facility for being repaired, the cost of which may altogether neutralize all its other excellent qualities. The great need is that every manufacturer of machinery should have a designer and master workman, thoroughly versed in every point. The mere fact of having served their full time in learning their trade or profession, is not always a sufficient qualification. A man must have an aptitude for his business; he must be a person of comprehensive ideas, not confined to mere routine work, if he would succeed as an engineer or a master workman. To become such he must begin with his earliest apprenticeship, and be afraid of neither his hours of work nor amount of pay. His whole mind, whether in or out of the shop, must be absorbed in acquiring the fullest mastery of his trade or profession.

FAILURE OF ENGLISH ENGINES IN RUSSIA.—The St. Petersburg newspaper *Novosti*, which boasts of the largest circulation in Russia, publishes the following statement regarding the alleged failure of the English engines supplied to the new torpedo cruiser *Iliue*: "The failure of the trial of the engines of the *Iliue* should cause our engineer experts to be more careful and cautious in the trials of engines constructed abroad. The cost of the *Iliue*'s engines is £50,000. For this sum the English bound themselves to give a speed of not less than 20 knots an hour, the designs being furnished by themselves. Instead of which, in spite of all the efforts and the presence of English engineers, stokers and artisans on the cruiser, and the use of the very best coal, not a single trial has yet been successful. The best trial has taken place in the presence of the Minister of Marine, Admiral Shestakoff. Another and final trial of the engines was to come off at a later day. If this trial be fully successful and the cruiser really accomplishes 20 knots, still this will not be a guarantee that the engines are in sound condition, and they might after the trial prove to be in an altogether unfit state. From the immense speed injuries might proceed, as was the case when the first torpedo-boats were taken over. For avoiding this contingency the minister has given orders that the engines of the *Iliue* are only to be accepted in the event of there being, after the trial, no repair whatsoever required."

PARAFFINE AS A LUBRICANT.—A correspondent of the *Railroad Gazette* announces that the Erie Railway has reduced its oiling expenses from \$5000 to \$1000 per year by using paraffine on passenger car journals, and has reduced the number of hot journals from 535 to 332. It is now used during the winter months, without the addition of any other oil, but it is found that in summer it becomes so limpid that it is hard to keep it in the axle-boxes. During the summer months it is therefore mixed with some other lubricant to give it more "body."

IMMENSE STEEL CASTINGS.—The Journal of the American Iron and Steel Institute for 1874, Vol. 2, page 439, gives a detailed account of the casting of crucible steel ingots at the Ahoukoffsky works, weighing 40 tons and requiring 1200 crucibles for their production. These are undoubtedly the largest steel ingots ever produced.

SCIENTIFIC PROGRESS.

A DANGEROUS LOCALITY.—According to all accounts there is a strip of country between Charleston, S. C., and Augusta, Georgia, which can hardly be designated as *terra firma*. The inhabitants of that region, the center of the late terrible earthquake disturbance, seem to be slowly working themselves into the belief that they are living upon a very thin shell, and that any moment a vast caving in may take place, completely engulfing the region. This fear is not founded upon a theory developed by inferences. It is the result of empirical science. Facts are being gathered daily showing that an immense cavity exists in the earth in this quarter. A man in Lanrens, S. C., dug a well down to a point where each stroke of the pick produced a hollow sound, and finally the bottom of the well fell out. A line was produced, but after using all the clotheslines of the neighborhood no one could find where the bottom went to, and all hope of recovery has been abandoned. In another town part of the highway disappeared recently into the bottomless pit, and the authorities are afraid to look into it. A local professor has made a careful computation, and says that it will take all the earth in the country to fill the cavity up, and the road commissioners will have to bridge it over or resign. In the town of Ninety-Six, of revolutionary fame, there is a spot where every earthquake rumble in Charleston has been distinctly heard, and it is concluded that the subterranean cave acts as an air-chamber through which the sound is conducted. The *Springfield Republican* says: We should regret very much to lose two or three States from the Union at this time, but if it should come in it would leave an invaluable curiosity. Excursion trains could be run from all directions to the edges of the crust of the earth, affording at once recreation and instruction to thousands of people.

ANTIQUITY OF MAN IN THE UNITED STATES.—Col. Charles Whittlesey has obtained evidence of the existence of two races of man, and possibly of a third intermediate race, as having held possession of the northern portion of the American continent—the more recent of them being the North American Indian or red men; the earlier race he terms the mound-builders. The antiquaries of Europe regard the people who used flint instruments as being prior to those who had implements of stone; and the latter, again, as older than the races using bronze or other metals. In the United States, the race next prior to the white man had very few implements of stone; their knives and arrow heads, their war implements and their agricultural tools, were almost entirely of flint; they had very few and rude instruments of native copper. The mound-builders, on the contrary, who preceded the red men, produced and used tools in the reverse order; their axes, adzes, and mauls were very numerous, and sometimes of stone; their copper tools abundant; but those of flint, very rare. Hence, in this instance, the most ancient people were the most industrious; they cultivated the soil; they possessed more mechanical ingenuity, and left more prominent and permanent monuments. On the Atlantic coast, from Nova Scotia to Florida, are numerous shell heaps, identical with those of Sweden, Norway and Denmark, and known as *kjekkenmæddings*. The examination of several caves gave bones of the wolf, deer, bear, rabbit, etc., mixed with skulls of the red race, and not dating back apparently more than 2000 years. Col. Whittlesey estimates 2000 years as the period also of occupation by the mound-building race, which does not take us back as far as the beginning of the historical period in Asia and Africa.

IMPROVED OBSERVATION INSTRUMENT.—Prof. Corehotani, an Italian inventor, has devised an ingenious kind of instrument for ascertaining the distance of accessible and inaccessible points from the observer and from each other. This apparatus consists mainly of a pair of telescopes mounted on a stand and fixed on a tripod for use; the telescopes being brought to bear on the object, and a reading then taken from a graduated scale on the instrument, which, compared with a set of printed tables, gives the distance. This arrangement obviates the necessity for the base line, which has hitherto had to be laid down in these operations, and all trigonometrical observations are dispensed with. Distance can be measured between the far-off objects, and, by means of a sheet of paper fixed on a drawing board, a rough plan of the country under measurement can be sketched; in the same way, also, the distances of ships at sea, or of moving objects on land, can be determined. The apparatus is claimed to be of special adaptation for land surveying.

INTERESTING CATALOGUE OF METEORS.—Mr. Charles U. Shepard, of New Haven, Conn., says he has accumulated the largest collection of meteoric stones in the United States, if not in the world. The collection embraces more than 500 meteoric stones and meteoric irons. The total weight of the collection is about 1200 pounds. The largest iron, procured from Colorado, weighs 436 pounds, and the smallest, from Otsego county, New York, weighs half an ounce. The largest entire stone, procured from Muskingum county, Ohio, weighs 56 pounds, and the smallest one, from Sweden, weighs less than 50 grains. The specimens have been gathered from all parts of the world. The catalogue

begins with one which fell November 7, 1492, in Alsace, and ends with one which fell February 12, 1875, in Iowa county, Iowa. There are none between 1492 and 1753, but most of the years since the latter date are represented, and some years by several specimens. Nearly every country in the known world is represented in the list. The entire collection is in one of the buildings of Amherst College.

FORCE OF EXPLOSIVES.—Nitro-glycerine and dynamite do not, when exploded, exert such a force as is popularly believed. To speak precisely, the power developed by the explosion of a ton of dynamite is equal to 45,675 foot-tons. One ton of nitro-glycerine similarly exploded will exert a power of 64,452 foot-tons; and one ton of blasting gelatine, similarly exploded, 71,050 foot-tons. These figures, although large, are not enormous, and need not excite terror. Seventy-one thousand tons of ordinary building stone, if arranged in the form of a cube, would measure only 90 feet on the side, and if it were possible to concentrate the whole force of a ton of blasting gelatine at the moment of explosion on such a mass, the only effect would be to lift it to the height of a foot. The foregoing figures are derived from experiments made at Ardeer with an instrument that gives accurate results in measuring the force of explosives.

ELECTRICAL TRANSMISSION OF ENERGY.—Mr. H. Fontaine has been making investigations at the works of the Compagnie Electrique, in Paris, on the electric transmission of energy. The experiments resembled those of M. Marcel Deprez in transmitting power from Creil to Paris, except that M. Fontaine substituted a resistance equal to 100 ohms for the line of 112 kilometers. The result arrived at was that 52 per cent of the power applied to the generating dynamos was transmitted to the brake of the receiving machine. Though this result cannot be considered as altogether satisfactory, yet it is much better than some of those already obtained. If even 50 per cent of the power of our waterfalls could be made available at a distance of from 50 to 75 miles by electrical transmission, the advantage to many industries would be incalculable. And this would be especially true of mining in many districts where fuel is expensive.

DRUIDICAL REMAINS IN PERU.—An article by M. Chalon, on "The Buildings of Ancient Peru," is worthy of notice and of universal interest. To the primitive epoch, succeeding the pre-historic, belong constructions laid with rough blocks, sometimes of very great dimension. It is very remarkable that these monuments offer the greatest resemblance to those which are known in the old world, particularly in France, under the names of raised stones, menhirs, cromlechs, dolmens and the general term druidical. They are very numerous and are spread through all parts of the territory of Peru. According to the author, they appear to have a religious significance and to have served for sepulcher and sacrifice.—*Comptes Rendus*.

A MUSHROOM DEVELOPED IN HUMAN SALIVA.—M. Galippe, having filtered saliva by means of Pasteur's apparatus, the filtered saliva remaining undisturbed, saw appear at the lower end of the filter, not in contact with the saliva, a mushroom made up of tubes of mycelium and of spores. By the advice of Prof. Max Cornu, M. Galippe has cultivated this mushroom in Van Tieghem cells and has been able to prove that it was neither an *aspergillus* nor a *penicillium*. This fungus, which has neither been described nor drawn heretofore, belongs to the monilia family. M. Galippe proposes to give it the name of *Monilia spiculosa*.—*Comptes Rendus*.

ALLOY OF ALUMINIUM AND TIN.—A useful alloy of aluminium and tin has been obtained by M. Bourhouze by melting together 100 parts of the former metal with 10 parts of the latter. This alloy is whiter than aluminium, and has a density of 2.85, a little greater than that of the pure metal, so that it is not too heavy to replace aluminium in instruments requiring great lightness of their parts. It is less affected by reagents, etc., than is aluminium, and also is more easily worked. Another of its merits is, that it can be soldered as easily as brass without any special preparation.

PHOTOGRAPHING CANNON-BALLS.—It is well known that cannon-balls have been most successfully photographed when on their flight from the cannon's mouth, but it seems that quite recently each photograph has been obtained, many of which show, in a remarkable manner, the head of condensed air which precedes the shot. It is this head of condensed air which makes it almost impossible, even for the most skillful rifleman, to hit an egg-shell engulged by a longish thread; and doubtless it is this "head" of condensed air which first wounds when an animal is hit by a rifle shot.

LIFE AND DEATH.—At a late meeting of German naturalists and physicians, Prof. Cohn, of Breslau, read a paper on "Questions of Life" which showed that the great problem is not yet solved, and that in the living organism there are forces which, though they must be mechanical, as they put bodies in motion, yet cannot be split up into components of atomic molecular forces. "The gulf which separates life from death, organic from inorganic bodies, is not closed, and none of our hypotheses will help us to bridge this gulf."

Boiler Treatment and Engine Management.

There being so many engines in use where first-class engineers cannot be employed, it may be of service to such persons to give a few simple rules to be observed in the management of boilers and engines. As new boilers have more or less oil in them, it is best to blow out the first filling at the end of a day's run. This need only be done where there is a tendency to foam. A small amount of oil will prevent incrustation.

The supply of feed-water should be regular. In no case should the feed pump be required to lift water more than five or ten feet, and where the water is fed hot it should come from a tank situated above the pump. If from the high temperature of the water the pump refuses to work, a remedy may be found in allowing a slight leakage around the plunger, thus allowing the accumulation of vapor to escape. A very small air-cock may serve the same purpose.

Never fire when the water is below the lowest gage. The safety valve should receive daily attention, and if not raised by the steam, should be raised by hand. Frequent firing is most economical. Sudden cooling is injurious to a boiler. Portable boilers, in particular, should not be blown off entirely when steam is above ten pounds; the doors should be kept shut while cooling. The efficiency and durability of a boiler are greatly increased by keeping it clean. Where water contains sediment, cleaning should be frequent. New engines that have been exposed in shipping should be thoroughly cleaned before starting, and oil of a good quality freely used during the first few days' run.

A priming tendency will sometimes be obviated by opening the throttle valve slowly. Cylinder cocks should always be open on starting the engine. All leaky joints should be stopped at once, and loose boxes taken up as soon as discovered. The governor belt should be kept tight to insure sensitive action of the governor. To lubricate the cylinder and valve, either cylinder oil or tallow should be used. Lard oil is not good for this. Beside, when new, frequently slip or require to be unusually tight. An application of equal parts of neat's-foot oil and tallow will be found very good on leather belts, and on rubber either linseed or castor oil—the latter preferred—but a small amount at a time will be needed. Animal oil should never be applied to rubber belts.

By observing the above and exercising good judgment but little trouble may be apprehended in the management of an engine.—*American Machinist.*

CUTTING MAHOGANY IN MEXICO.—In Mexico the season for cutting mahogany usually commences about August. Gangs of Indian laborers are employed, consisting of 20 to 50 each, under direction of a captain. Each gang has also a cazador or "hunter," whose duty it is to search the trackless forests for suitable trees to be felled, and to guide the wood-cutters to the places. The felled trees of a single season are scattered over so wide a space that miles of roadway have to be made to reach them, and numerous rude bridges constructed over the rivers that lie in the way. All the larger logs have to be "squared" before they are brought away on rude wheel-trucks along these forest roads. Each truck requires seven pairs of oxen, and the work could be more expeditiously done by our portable engines. The implements used by the Mexicans in this trade are rude and insufficient, large quantities of timber being often spoiled by their insufficiency, combined with the ignorance of the workmen employed.

LOSS OF LIFE IN THE MANUFACTURE OF EXPLOSIVES.—Colonel Majendie, Her Majesty's inspector of explosives, has come to this country, in compliance with instructions from his Government, for the purpose of traveling through the oil regions and studying the laws in different States touching the storage, distribution and regulation of mineral oils and other highly inflammable liquids. He states that heretofore the Explosive act was enacted, 10 years ago, England and Wales had a death-rate of 43 per cent per year in the manufacture of explosives, whereas during the last 8 years of the act, the entire death-rate in the whole of the factories in England, Scotland, Ireland, and Wales included was only 8½ per cent a year. Last year there was a loss of life of only five out of every 7000 employed in these manufactories.

THE SAME OLD STORY.—St. Louis is now priding herself upon having a genuine mining boom. The *Globe-Democrat* of that city gives an account of the greed with which new mining properties are taken up, and cites an instance of a mine on Seaton mountain, capitalized for \$1,500,000, when in reality \$10,000 would be a good price for it. There is no prospect of the mine paying upon such an outrageous price. The same paper reports that an expert will be sent out to examine the property. The final result of this so-called mining boom in St. Louis will be the wholesale robbing of a great many people of their hard-earned savings, and a general curbing of Colorado. We have warned you. Now fire away.—*Idaho Springs News.*

QUADRUPLE-CYLINDER ENGINES.—In view of the high economy of triple expansion, quadruple-cylinder engines are beginning to attract increased attention.

USEFUL INFORMATION.

Rouge for Polishing Metals.

As the rouge found in the market does not meet the requirements of the workman, at least for every metal, we give a very simple method, which allows the workman to prepare for himself just the quality and quantity necessary for his particular work. Heat sulphate of iron, of as pure a quality as can be obtained (also called green vitriol), in an iron vessel over a slow fire, stirring it continually with an iron spatula until it is dry and takes the form of a pale greenish-yellow powder. This powder, after being crushed in a mortar and sifted, is to be calcined in a new crucible and exposed to the fire of a melting stove as long as vapors arise from it. As soon as no more of these can be observed, the contents of the crucible may be left to cool, and when cool will appear like the rouge used for polishing. Its color may vary from pale red to brown-red, or even to blue and violet, but these variations arise only from the different degrees of heat employed, and it may be observed that the higher the temperature has been during the process, the darker the color and the harder the powder—a fact which also explains why the pale red powder is used only for gold and silver, while the violet is used for steel. No matter what the color is, it is very important that the rouge be well bruised and washed in water before it is used. For this purpose three clean glasses are taken and one of them is filled with pure water, in which a part of the rouge is mixed by stirring it for some time with a small piece of wood. After allowing about half a minute for the rouge to settle to the bottom of the glass, the remainder of the red liquid is decanted into the second glass, but every particle of the deposit must be left in the first one. The same process has to be observed also for the second and third glasses, but with this difference: the powder in the second glass is allowed to settle about two minutes, while in the third one it is left for several hours—that is, until the water resumes its natural clearness. The sediment of the first glass is almost valueless, that of the second of medium quality, but that of the third glass is of a very good quality and fit to be used with great advantage after it has been slowly dried. In some cases the rouge thus obtained may be mixed with grease, and generally it will be found of great advantage to moisten it with spirits of wine and burn it in a clean iron vessel.

CURIOUS FACT REGARDING "RICH" MORTAR.

—In conversing recently with one of the oldest and most successful contractors and builders of Chicago, says the *Chicago Journal*, I learned a very curious fact in relation to mortar. He says that mortar in the interior of walls, especially if it be what is called "rich" mortar, is liable never to harden, but to retain its soft consistency even for centuries. This can only happen where the interior of the wall is hermetically sealed against the external air. This both arrests evaporation and shuts off the chemical operation of the atmosphere. My informant said that in England, not long ago, an architect dug in a thick stone wall 300 years old, and took from between the interior stones some mortar as soft as it was the day (the wall was built; and he himself has made some discoveries of the same character. Any one, he says, who doubts the possibility of such a thing can easily satisfy himself of it by putting some rich mortar into a glass bottle and hermetically sealing it. He will find that it will never get any harder than when it was put into it. This curious fact about mortar may be the explanation of some hitherto inexplicable and horrible casualties that have taken place by the sudden collapse of great buildings.

SHOOTING OUT A FIRE.—A chimney leading from the library of George Small, 14 West Monument street, took fire at 11 o'clock yesterday morning and caused an alarm from box 315. There was a slight loss. During the excitement a novel mode of extinguishing the fire was put in use. It has been a practice for years on the part of the police and Fire Department. When the firemen arrived one of the members borrowed the pistol of officer Deaver, of the Central District, and, standing below, fired five shots up the chimney. Instantly the soot and fire dropped down and the fire was extinguished. It was stated that in cases of chimney fires this scheme has worked well. The concussion loosens the accumulated soot, and often much damage has been prevented in this way. The police say it is an old practice with themselves and has never failed.—*Baltimore paper.*

A NEW SYSTEM OF PUDDLING RESERVOIRS, ETC.—It is stated in a Scotch newspaper that Mr. Thomas Fraser, of Aberdeen, has adopted a new method of puddling reservoirs, etc., with clay. Instead of using the clay in the customary wet and plastic state, Mr. Fraser proposes to dry and pulverize it before application; and he claims that by this system greatly improved results can be obtained. Mr. Fraser considers that clay, when wet, has reached its extreme point of "expansion;" and that, accordingly, water will filter through it. Having arrived at this conclusion, Mr. Fraser proceeded to determine whether, if used for puddling in a dry compressed state, clay would not absorb a certain proportion of water, which would expand

it, and render further filtration impossible. He accordingly dried and powdered some clay, and pressed it to a depth of six inches in the bottom of a tube eight feet long, closed at the bottom by a perforated piece of sheet zinc. Mr. Fraser is confident that the system of dry puddling, besides being more efficient, is also likely to be more economical than the ordinary practice of using wet and plastic puddle. As against this, of course, is to be set the well-known fact that the common style of puddling, when carefully done, answers its purpose perfectly, and whether the clay is extremely expanded or not, water does not, in reality, flow through it. Then, as an expense, common puddle is made on the spot, while the drying and pulverizing of the clay for making dry puddle by Mr. Fraser's plan would, in the case of large works, entail a prohibitory amount of fuel and handling. But the fact in regard to the difference in the value of dry and wet clay for puddling purposes is interesting and valuable to know.

PERFUME FROM FADED ROSES.—Instead of throwing away bouquets of faded roses, or other flowers of special perfume, place the faded or dead dry leaves in a convenient dish and sprinkle a little alcohol over them, and the room where they stand will be filled with their odor. In England it is a common practice; very large vases are kept about rooms, into which all the faded rose-leaves are thrown and sprinkled with alcohol, and thus a very pleasant atmosphere is secured about the house. There is no other way of preparing rose perfume, except by the regular process of distilling. Rose flavor can be given to cake, if any one fancies it, by putting the butter to be used in the cake in a saucer or plate, and setting it for some hours inside a vase filled with rose-leaves that are sprinkled with alcohol.

FORCE OF HABIT.—"There is nothing in the world that shows the inborn tendency of mankind to run in a rut more than the architecture of the modern shirt." So said a young man of iconoclastic tendencies. "For years men's vests have been buttoned almost up to the chin, and the little piece of shirt front that would be left exposed has been covered by a necktie. And yet men go on wearing shirts with fronts down to the waist starched and ironed till they are as stiff as a holed plate, and they pay every week for getting two or three of these things carefully polished. A man might as well have the back of his vest laundered every week."

TO CLEANSE GLASS GLOBES.—If the globes on a gas fixture are much stained on the outside by smoke, soak them in tolerably hot water in which a little washing soda has been dissolved. Then put a teaspoonful of powdered ammonia in a pan of lukewarm water, and with a hard brush scrub the globes until the smoke stains disappear. Rinse in clean cold water. They will be as white as if new.

GOOD HEALTH.

Pasteur's Hydrophobia Cure.

M. Pasteur has just made his third report to the Academy of Sciences in regard to his experiments in hydrophobia cases. The report is quite in detail, giving statistics of cures and deaths, together with experiments upon human beings and animals in further perfecting his mode of treatment.

According to this report, up to March 1, 1886, 350 persons bitten by dogs proven to have been mad had been treated. This was in addition to many other cases, the nature of which was more or less uncertain.

Up to October 31, 1866, not less than 2490 persons, all told, had submitted to his treatment. They were from every country in Europe, besides 18 from the United States, 2 from Brazil, and 2 from British India. As might be expected, much the largest number was from France—1726. Confining himself exclusively to his French patients, M. Pasteur says there are 10 for whom the treatment failed to prove effective—six children and four grown people. Two others came to the laboratory too late to hope for success, and both died. There have also been 10 deaths out of the 1726 cases, from other causes than hydrophobia, so far as known to M. Pasteur. Although there might have been quite a number who were not bitten by rabid animals, still the statistics given sufficiently prove the general efficacy of the method.

It may well be supposed that there could not have been any very large number in France over the 1726 who availed themselves of this remedy who were thus bitten; yet M. Pasteur has a record of 17 deaths from those who did not apply to him for relief—a greater number than he lost from all his applicants.

Statistics show that there have been only two deaths from hydrophobia in the Paris hospitals since Nov. 1, 1885, or one year up to date of this report; but previous statistics show that for the previous year the annual average had been 12, and during one year 21 were reported. These statistics are most satisfactory and conclusive as to the efficacy of M. Pasteur's treatment.

In regard to the treatment of the 19 Russians so fearfully bitten some time ago by mad wolves, and about whom much has been said, M. Pasteur asserts that but three of the number have died—one succumbing while still under treatment and the two others only a few

days after it was completed. A telegram from the mayor of the village where these men live, received only the day before this report was issued, reported that the 16 were all well and in good health. It should be here remarked that M. Pasteur's recent experience has enabled him to greatly improve on his first mode of treatment, so that it may now be quite confidently assumed that the world has at last secured an almost perfect immunity from the danger of this hitherto almost always fatal and terrible disease.

The Danger of Kissing.

There is danger in promiscuous kissing, especially in the very common practice of grown people, particularly strangers, in kissing little children. A physician lately said to a friend that he never allowed it in his family. "The danger," he said, "is so complicated and yet so certain that it would take too much time to describe it here. In my case, all kinds of people come to my house and office to consult me, and they often wait hours. If one of my children happens to come in they are almost certain to talk to it, and you know almost the first impulse with people who notice children is to kiss them. Bah! it makes me shudder—tainted and diseased breaths, lips blue with cancer, foul and decayed teeth. You would kill a stranger who would waylay your young lady daughter and kiss her by force, but the helpless, innocent, six-year-old child, susceptible as a flower to every breath that blows, can be saluted by every one who chances to think of it. I tell you it wasn't Judas alone who betrayed by a kiss. Hundreds of lovely blooming children are kissed into their graves every year."

"But, doctor, how can a mother be so ungracious as to refuse to allow people to notice her sweet little children?"

"There need be no ungraciousness, or, if there were, which is the more important, the safety and well-being of the child or the permitting of a habit of ill breeding and doubtful morality at best? Let the mother teach her child that it is not a kitten or a lapdog, to be picked up and fondled by every stranger, and instruct it to resist any attempt to kiss it. Why, there are agents, peddlers of household wares, who make it a custom to catch up a prattling child, kiss and pet it, and so interest the mother that she will buy something she does not want. I tell you there is death in the kiss! The beloved and lamented Princess Alice of Hesse took diphtheria from the kiss of her child and followed it to her grave. Diphtheria, malaria, scarlet fever, blood poison and death lurk in these kisses."

HINTS ON EATING FRUIT.—A correspondent of the *San Diego Union* furnishes the following very useful and suggestive hints on eating fruit, the latter portion of which we would call to the special attention of our city retail fruit dealers:—"The Health Officer some time since called attention to the danger of eating old or partially decayed fruit. This matter cannot be too strongly urged upon the public. There is still another source of alimentary diseases which seem to me equally dangerous, viz.: the eating of raw fruit over which innumerable flies have crawled. How often have we seen boxes of grapes on the sidewalk literally swarming with flies! When we think of the unspeakably filthy quarters from which those flies have gathered and the ease with which disease is thus carried from the sick to the healthy, we may well hesitate to buy and eat grapes thus unprotected. I speak of this fruit especially, because it is nearly always eaten raw, and the ordinary rinse does not at all remove the dangerous specks from its skin. Will not our fruit dealers, especially on warm days, make a more liberal use of netting?"

A NEW DISINFECTANT.—A new disinfecting compound for purifying the atmosphere of the sick-room has recently been presented to the Berlin Medical Society. Oils of rosemary, lavender and thyme, in the proportion of 10, 2½ and 2½ parts respectively, are mixed with nitric acid in the proportion of 30 to 13. The bottle should be shaken before using, and a sponge saturated with the compound and left to diffuse by evaporation. Simple as it is, the vapor of this compound is said to possess extraordinary properties in controlling the odors and effluvia of offensive and infectious disorders.

EARTH INFECTIONS.—A barrel of kerosene oil buried 10 feet under ground will, it is said, contaminate every well within a quarter of a mile, and the oil will be apparent to the taste. The accumulations of privy vaults will extend their pernicious influence even a greater distance, although the water which it affects may not indicate to the taste the presence of any impurity. Whether privy vaults are open or plastered with cement, they cannot keep the poisonous gases and substances from penetrating the surrounding soil.

COFFEE AND EGG FOR SICK PERSONS.—A sick person wanting nourishment and having lost appetite, can often be sustained by the following, when nothing else could be taken: Make a strong cup of coffee, adding boiling milk as usual, only sweetening rather more; take an egg, beat yolk and white together thoroughly; boil the coffee, milk and sugar together, and pour it over the beaten egg in the cup you are going to serve it in. This simple receipt is used frequently in hospital practice.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

CHROME.—Livermore Herald, Dec. 23: A new cut, to tap the several pockets on a lower level, is being run at the Douglas Mendenhall chrome mine. But little chrome will therefore be taken out during the next month. There is plenty in sight, however, to last for months.

Amador.

PLYMOUTH.—Cor. Amador Sentinel, Dec. 20: Plymouth is a very lively town at present, a good many men being employed at the different mines, the Plymouth Con. and New London. There are several small mines in active operation, and the prospects are that there will be a boom here in the coming spring. Grading for the additional 40 stamps at the Pacific mill is being pushed rapidly. Reeves and others are putting up a small mill for the reduction of ore from the Little Giant. The crusher formerly belonged to Clemens, at Enterprise. Evans & Co.'s mill is running nearly all the time on ore extracted from several mining claims. Ebe has got back from Idaho and says he is going to start up his mill on the Hardscrabble mine this winter.

MCKAY.—Amador Ledger, Dec. 25: The first installment of \$2000 on the purchase price of this property was paid last week. The work of sinking is prosecuted vigorously, and the managers have unbounded confidence that Nature has bountifully stored up her metallic treasure within the confines of their claim.

KENNEDY.—The outlook for the Kennedy continues flattering, although the mill is by no means as substantially constructed as it ought to be, considering the character of the work it has to perform. It was built in a hurry by contract, and now after a couple of months' activity it begins to show its weakness. It is also said that a considerable percentage of gold escapes in the tailings. This is true, more or less, with all quartz mills, but whether the Kennedy exceeds the average of loss we are unable to say. The yield does not come within 75 per cent of the assay value. An expert from San Francisco is now in charge of the mill, and better results are anticipated. Notwithstanding these disadvantages, the prospects of the mine are unquestionably good. In one level a large body of barren rock has been encountered, but in other drifts the ore is reported of excellent quality, reaching as high as \$10 per ton. Reports are current that the company has paid the entire purchase price of the property, two months before the agreement specified. This certainly shows that they have the utmost confidence in it as a gold-producer.

MISCELLANEOUS.—The Zeile mine has just added a circular saw, which will be used in utilizing waste scraps of timber, in converting them into lagging, wedges, etc. At the North California the tunnel has reached a distance of 600 feet. A contract for another 100 feet is about to be let, and it is calculated that this will tap the ledge. There are good reasons for believing that this property will develop into one of the best mines in the Black Hill region between Drytown and Plymouth. Some of the rock from this claim has yielded by actual milling over 77 per ton, which leaves a very handsome profit, as it can be mined at a trifling cost. The Loyal Lead claim is being surveyed in the interest of San Francisco capitalists, who are thinking of purchasing. The mill is idle for want of water.

Butte.

CONCENTRATOR.—Oroville Register, Dec. 23: The concentrator that is being put up at the Mineral Slide mine will be started up early next month. Mr. McCarty on Butte Creek has a good ledge that prospects well, and assays \$54 a ton. The decision on the Pershbaker mine is looked for this month, and the mine will probably be running in a short time. This is one of the richest mines in the State; \$1300 has been taken out at a single load. The Black Channel has been shut down for the present. The Ohio Company at the Forks of Butte have started up for the winter. A large number of men are prospecting on the Magalia ridge for quartz and several good indications have been found.

GOLDEN CHANNEL.—There is a good deal of merit in the Golden Channel mine, on Feather river. The plan of the mine, with map showing bend of the river, length of tunnel to be run, etc., can be obtained from Mr. F. W. Reece. We believe this will prove one of the best mining developments in Butte.

Calaveras.

WEST POINT.—Cor. Calaveras Chronicle, Dec. 25: The announcement in your paper in regard to the promised mining boom in West Point district is about to be a realized fact, that is, if the present developments continue. Our mines have not been idle during the past twelve months. The amount of \$100,000 in gold has been taken out of them and sent below, besides 150 tons of sulphurated quartz rock, valued at \$200 per ton, which has been shipped to Selby & Co.'s smelting works at Vallejo, for reduction. Indications are favorable for double that amount next year. The following mines are in good hands and looking well under the management of their respective superintendents: Keltz Mine, Supt. O. B. Peasley; Lockwood Mine, Supt. G. Brown; Scorpion Mine, Supt. Campbell; Water Lily Mine, Supt. Hicks; North Star Mine, Supt. Captain Mills; Catarrah Mine, Supt. S. Watkins; Bismarck Mine, Supt. O. Mentzel; Specimen Mine, Supt. W. Bastian; Oro Fino Mine, Supt. W. Cook; Valentine Mine, Supt. M. Ayres; Soap Root Mine, Supt. John Henry; Old Henry Mine, Supt. J. Jenkins; Billy Williams Mine, Supt. J. Rowe; Barnes Mine, Supt. J. Jenkins. There are also a few more just started that I expect will fall into line next year.

Fresno.

GOOD FOR THE MOUNTAIN VIEW.—Republican, Dec. 22: Last Sunday Thos. R. Brown came down from the mines in Fine Gold district, bringing with him several hundred pounds of ore from the Mountain View mine. The ore was taken from the bottom of the shaft, 120 feet below the surface, and is a rich mass of sulphurets and decomposed quartz, richly studded with free gold. Experts estimate that the rock will assay \$5000 per ton. The Mountain View is one of the most promising mines now

being developed in this county, and is owned by P. B. and M. J. Donahoe, T. B. Brown and J. N. Albin. They recently purchased it for the sum of \$15,000. They now have about 100 tons of ore in view which it is thought will yield \$1000 per ton.

Inyo.

GOLDEN STAR MINE.—Independent, Dec. 23: At the Golden Star mine, near Independence station, a house has been built and hoisting works erected. Water for steam-power will have to be carried in pipes some distance, and for the present only horse-power is used. Mr. John Patterson, the superintendent, is pushing the work of exploration of the mine vigorously, and has as many men employed as can be worked to advantage.

Mono.

LUNDY.—Bodie Miner, Dec. 22: William Onkst is in from the Tioga and Lundy region on land business. Mr. Onkst now has charge of pretty much all the mines out there. The Miner has time and again asserted the conviction that there is still great mineral wealth in the ground out there which must eventually be gathered. There is a mineral belt of nearly 70 miles in length, extending from Lundy to the southward, that will some day astonish the world by its abundant yield. It is definitely settled that a sale of a group of mines at Lundy, Mono county, has been concluded, and that the purchasers will commence work as soon as climatic conditions will permit. This will be good news to many who have lived in that camp. People have ridiculed Tioga simply because they don't know anything about it.

Nevada.

CHEAP POWER.—Nevada Herald, Dec. 22: The invention of the Pelton wheel and the introduction of water power and its application to mining and milling has done more for the development of Grass Valley and Nevada mining districts than all other improvements taken together. The Idaho mine saves \$30,000 per year, and the Providence, we presume, in the same proportion. An idea of how cheaply prospecting may be done by using water instead of steam may be formed from the following statement, which we know to be correct. The Oro Fino mine is a prospect on Rush creek in which the writer is part owner. The incline is down nearly 200 feet. To hoist the rock and pump all the water that a six-inch Cornish pump can raise requires the use of five inches of water under a pressure of 150 feet. This costs, at 20 cents per inch, \$1 per day. To do the same work by steam power would require expensive machinery and the consumption of at least one cord of wood per day. It is cheaper than prospecting by windlass or horse-power. It is the cheapest and the safest and the best power known. The Pelton wheel and the South Yuba Canal Company's system of ditches running along the ridges lying above the quartz belts, increase the value of the resources of Nevada City and Grass Valley by over 50 per cent.

NEVADA COUNTY MINE.—Transcript, Dec. 21: The ledge in the shaft of the Nevada County mine continues to improve as it is sunk up. It is now from 12 to 14 inches thick, solid, and with every indication of permanency. The ore is dark with sulphurets, and in places free gold is freely plastered over the sulphurets. The stockholders appear to be about to realize the substantial reward that their energy and perseverance entitle them to.

THE IDAHO.—Grass Valley Union, Dec. 23: The annual meeting of the Idaho Min. Co. was held on Tuesday evening, at which the reports of the superintendent and other officers were read and ordered to be filed. These reports are not obtainable for the publication of their details, and it can only be said that the year has been a good one for the company and dividends have been paid each month. It is understood that the workings of the Idaho are getting well up toward the Maryland line, and that the pay chute in its dip to the eastward is going into the Maryland on the east, just as the pay chute dipped eastward from the Eureka into the Idaho. This chute has been of wonderful extent, and although not always rich along its course it has never given out, and has produced in all (to the Eureka and Idaho companies) over \$13,000,000. Whether it is ever going to give out is a question, although the time may come when its gradual dipping into the earth may carry it too far down for profitable working. This has been the greatest chute of free gold ore ever discovered on the Pacific Coast, and serves to show the richness and value of the Grass Valley mining district, which has, it is believed, produced \$100,000,000 since the gold discovery in 1849.

THE NEW MINING VENTURE.—Foothill Tidings, Dec. 27: Mr. W. H. Weldon is at work sinking a shaft on the Murphy ground, in the eastern part of the town and near the Jewish cemetery. The shaft is now down about 10 feet and the size of it is 7 feet by 10. This is to be timbered by 8 by 10-inch timbers. The shaft is to be divided into two compartments. From the bottom of the shaft a tunnel to the west is to be run, and early in the spring another shaft on the line of the tunnel will be sunk on Grass Valley Slide, or in Mr. Reuben Thomas' ground. From this second shaft the tunnel will be run both east and west, and that to the east will meet the tunnel from the Murphy ground shaft. In the early spring, and when timber can be had, hoisting works of a very substantial and efficient kind will be put up at the Murphy shaft. The machinery will be run by water power, with a pressure of 260 feet. The tunnel will probably strike the western extension of the Crown Point ledge. There is plenty of money at the back of this venture, and experienced mining men are conducting the work.

THE NORTH STAR MINE.—Transcript, Dec. 29: It is claimed on excellent authority that the North Star mine at Grass Valley is showing up a magnificent development of high-grade ore, and that the future and permanency of this mine is beyond all dispute and peradventure. The splendid 30-stamp mill of the company which has been in process of erection for several months is partially completed, and will be in active operation in about a month. This mill was erected by the Rison Iron Company, and it is said to be a marvel of automatic appliances and other arrangements connected with the crushing and amalgamation of gold. Mr. Hammond, a brother of the United States Surveyor-General, who has a world-wide reputation, is the general manager of both the Empire and North Star mines.

Placer.

IOWA HILL.—Cor. Placer Republican, Dec. 23: Mr. Mead, who purchased from Wm. Van Vactor

the Canada Hill mine, struck rock last week that will pay \$500 to the ton. Whether it is anything more than a chimney or pocket deponeth sayeth not. At Damascus the Mountain Gate Company is in rich gravel and plenty of it. The channel is running in a southerly direction toward that Dam claim superintended by Andy Watson, who says, notwithstanding the amount of deadwork performed in running the tunnel ahead 900 feet, they have taken out enough to pay expenses. W. Jones, foreman of the Red Point Company, was in town the other day, and says that the tunnel is in over 1000 feet, and they expect to have it into the channel by July next.

Plumas.

QUARTZ.—Plumas National, Dec. 25: J. E. Spencer will start up his quartz mill, on the Miller ledge, situated on the headwaters of French creek, about three miles west of the Buckeye house, the first of the week. From all accounts the quartz prospects very rich.

GRANITE BASIN.—Joseph Peppin was in from Granite Basin last week and reports that he is in 150 feet on the Commercial ledge, and has about 150 tons of good rock on the dump. We are glad to hear that he has "struck it" this time. Christie & Snyder have run a tunnel on the Michigan, tapping the ledge at a depth of 100 feet. The rock is reported very rich, and the ledge is about three feet wide. The outlook for Granite Basin quartz miners is better than for years, and we expect to hear of some large cleanups before long.

NORTH FORK.—The Sunnyside mine is working 16 men, and under the intelligent management of R. Hobart, taking out big pay. Ellis & Bressler, at Big Flat, are working in good gravel, at present. Steven Dean, after running a long bedrock tunnel in his claim, raised up last week and struck a fine body of gravel that promises to yield lots of golden nuggets. Dick White & Co. are running a tunnel from the old works to the new tunnel, where they expect to strike it as rich as ever. Savercool Bros. have leased the Dutch Hill mine and are putting everything in good working condition. There is no doubt this famous old mine will pan out satisfactorily under their able management.

San Bernardino.

ORO GRANDE DISTRICT.—Cor. San Bernardino Index, Dec. 23: The old mining camp of Oro Grande on the Mojave river has been renamed Marble City, from a marble quarry recently discovered in the vicinity; a town site has been surveyed and laid off into streets; the Cal. Southern is putting in a side track, and considerable building is projected. Besides the marble quarry, mines are being opened in the vicinity. The old Oro Grande mine was opened and a mill put up in 1881, but owing to the expense of working and transportation it was abandoned. It has now been reopened. The What Not mine has a tunnel over 300 feet long on the vein, and a shaft is going down at the mouth of the tunnel. The ore improves as the sinking progresses. West of and running parallel with the What Not is the Blind Lead mine, owned by the same parties that are interested in the What Not. A shaft has been sunk on the north end of the vein to a depth of 30 feet and between 30 and 40 tons of \$83 ore extracted. The Flint and Last Chance are new locations on which but little work has been done. There are many other rich mines all over the hills, both on the east and west sides; in fact the whole surrounding country is a mass of mineral and marble. Wood and water are plentiful. The gold is found principally in carbonate of lead and is smelting ore. A smelter is projected.

CALICO.—Print, Dec. 26: Chloriders in the camp are doing well, as a general rule, and every week new leases are taken on the undeveloped mines as well as those that have been thoroughly prospected. Frequently ore is discovered in places where miners have walked over for months and years, and rich strikes made in most unexpected places. There is undoubtedly ten times more ore undiscovered than that obtained from developments in the past, and it is thought by experienced and impartial miners that in ten years from now the output of bullion from the camp will be many times greater than at present. The large profits made by the various companies in the past is beginning to attract attention abroad, and more capital will soon be in extensive operation in this and neighboring districts.

Shasta.

MILL.—Shasta Democrat, Dec. 23: Jack Conant's 10-stamp mill, on Squaw creek, was started up last Friday morning. It works like a top. Jack's monthly cleanup now will be big. A new and rich body of ore was struck in the Balaklala mine a few days ago, at a depth of 60 feet. Good ore in the new tunnel is encountered every day, also. The Tiffin mine, at Lower Springs, improves every day as the tunnel is run. The vein is four feet wide and the ore prospects big in free gold from wall to wall. The Central mine, in Old Diggins, the property of Bell, Hopping & Co., was last week sold conditionally to Edward Riely, representing a New York company. J. H. Vannoy, owner of the Newton, on Squaw creek, adjoining the Uncle Sam mine, last week struck a rich body of ore on his mine. The Calumet Mining Company's mill, situated on the east side of the river two miles above the mouth of Middle creek, will be running by the first of the new year. This is a new mill called the "Rotary Stamp Battery," and miners generally are anxious to see it in operation.

Sierra.

BALD MT. EXTENSION.—Mountain Messenger, Dec. 25: The report that the Bald Mt. Extension mine was about to be closed is purely gratuitous and has no foundation in fact. The return in gold for last week was 160 ounces. Mr. S. Lock has taken hold of the old Plumbago quartz claim, at Minnesota, and is at work getting ready to pump out the old shaft. For this purpose steam will be taken from a boiler about 600 ft. away. The old shaft is only some 25 ft. deep, but there is considerable water to contend with.

NUGGET.—Mr. Staley, a pioneer of Downieville, recently returned to this section after an absence of over 20 years, found a nugget of gold up the North Fork, last week, which weighed eight ounces. He is also getting some fine gold in his claim, which is in the bank near where, in the river, in early days, three men took out 120 lbs of gold in one day. The men were sailors. The new quartz mill of Theodore Smith, of Alleghany, is all ready to run as soon as water comes. The Phenix ditch is about half done.

There is no prospect of getting the mill running before next summer.

Sonoma.

COAL MINE.—Sonoma Democrat, Dec. 23: Ex-Supervisor S. R. Houser is prospecting a coal discovery in the Guallala river about eight miles from the coast. The deposit was first discovered some years ago by Lieut. Jacobsen. Mr. Houser bought the claim several years ago and recently began prospecting it. He has a shaft down about 30 or 40 ft. and it looks very flattering, the indications showing a vein 18 ft. wide and of variable thickness. The quality of the coal has not been ascertained, but experts who have examined specimens say it promises to be excellent. The facilities for shipment are first-class.

Trinity.

BULLYCHOOP DISTRICT.—Trinity Journal, Dec. 25: The Davis Brothers, of this rich and growing quartz-mining district, were in town this week, and from them we obtained the following account of the condition and development of some of the more prominent mines of that section:

MAAMOTH.—The Mammoth mine, of Foster & Hart, well named for its extent, is a 50-ft. ledge on which a shaft has been sunk 25 ft. During the past summer, ore crushed in a Hill rotary mill which got away with 10 to 15 tons per day, averaged from \$12 to \$15 per ton. A tunnel 400 ft. in length is now being run by contract to tap the ledge at a depth of 150 ft., and the company has also let a contract for 300 cords of wood. A new 15-stamp mill is now on the road for the Mammoth and is expected to arrive in a few days.

POUND CAKE.—This mine belongs to Davis Bros. & Co., and is a 6-ft. ledge which is tapped by a tunnel at the depth of 160 feet. The ore is crushed by a 5-stamp mill and goes from \$15 to \$20 per ton. The property is now bonded to an English company, and several other parties are anxious to take it in the event that the bond is forfeited or released.

DOLLY VARDEN.—Just above the Pound Cake, and belonging to the same parties, lies the Dolly Varden mine, with a 3-ft. ledge on which a shaft has been sunk to the depth of 25 feet and is being sunk deeper.

CENTRAL.—Titus & Co. are the owners of this promising mine, which is now being worked by Somers & Scott. The ledge is 8 feet in width and is tapped by a tunnel at the depth of 150 feet. The rock is worked in a Huntington mill and goes from \$8 to \$10 to the ton.

BULLYCHOOP AND OCCIDENTAL.—These two mines, belonging to the Bullychoop & Occidental Co., are at present lying idle and will not be worked during the winter. They have been leased to Cross, Briggs & Franklin, who did some work during the summer and will resume in the spring. The company have a cannon-ball mill, but the last rock crushed was run through the Mammoth mill, on the other side of the hill; a lot of 30 tons averaged \$20 per ton. The Bullychoop ledge is from four to six feet, while the Occidental measures from eight to ten feet. There are shafts down a considerable distance on both ledges. A long tunnel has been run to tap them at great depths, but has not yet reached the ledges. During the past summer there were more than 200 men in the district, about 50 of whom will winter there. All the others will return in the spring with many new workers and prospectors. Bullychoop is not a mushroom district; it has substantial merit and is building lasting prosperity thereon. Its growth has not been rapid, but it is permanent.

STRUCK IT AGAIN.—The untold wealth of Deadwood district is being uncovered and brought to light. A note from Superintendent Henry Martin, of the Brown Bear Company, informs us that they have found the ledge in the Monte Cristo in Tunnel No. 4, and that it shows up good. A sample of the ore sent to John Martin at this place is very rich.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, Dec. 25: The output of ore for the past week fell off a little from the previous regular production, owing principally to the temporary trouble from gas, caused by tapping the smoldering fire in the old workings by a drift on the 1600 level. This is effectively subdued and obviated. The assay value of the ore milled during the week is about the same as that milled last week, according to average mill battery samples; the official figures will be given to-day, they not being received in season for publication to-day in this report. 1600 level—The lateral drift north from the north end of the mine was extended 29 feet, making a total of 533 feet. 1500 level—The lateral drift north from the Consolidated Virginia shaft has connected with the upraise from the 1650 level. 1435 level—The winze being sunk below the track floor of the east crosscut is down 67 feet. Material, vein matter and low-grade quartz, 1400 level—The winze being sunk below the track floor of the south drift, 300 feet south of the Consolidated Virginia shaft, has connected with the 1300 level, south drift. 1300 level—The drift started north from the Consolidated Virginia shaft has connected with the upraise above the 1400 level.

SAVAGE.—600 level—Making good progress in the excavation for a large working station on the west side of the old shaft. 800 level—Main south lateral drift extended and timbered 30 feet. Two crosscuts have been started west from this drift. No. 1 is 100 feet south of the north line of the mine, and No. 2 is 55 feet further south. No. 1 is advanced 36 feet in fine-looking quartz, from which some assays are obtained. No. 2 is extended 22 feet, and its face is now entering the quartz body. 1640 level—Drifting north and south is commenced in the fine body of quartz developed at that point, and the rock is being sent out from it through the Sutro tunnel. A new hoisting or gallow frame is being erected over the old main Savage shaft and the works generally are being put in thoroughly practical condition for active service, which will be shortly required.

HALE AND NORCROSS.—1300 level—Main south lateral drift advanced and timbered 45 feet; total, 145 feet from the station. The face of this drift is in a fine character of quartz, carrying some ore. At a point 30 feet from the face of this drift a crosscut, No. 1 has been started west, which is extended and timbered about 20 feet, and shows throughout the same character of quartz and ore as is found in the

main south drift. On this level the north drift has been extended and timbered 40 feet. Second Station level—West drift advanced and timbered 60 feet; total length from the shaft, 190 feet. In the main vertical shaft of the mine a substantial air-pipe, 20 inches in diameter, is being put in, which is to be carried to the 1300 level. In the main incline, or continuation of the main vertical shaft, the car tracks have been repaired and put in complete order to the Suro tunnel connection.

IOWA.—The cleaning out of the Old Iowa tunnel has been done to a distance of over 700 feet from its mouth. The large 40-foot ledge and rich stringers reported cut in this tunnel in 1876 have been found, and good prospects obtained therefrom. Work of development will be commenced immediately in this tunnel. Tunnel B continues cutting stringers of ore dipping flat to the west, and shows indications of near approach to middle lode, from which the bowlders of gold ore found on the surface were shipped. Five tons from these croppings were milled last week for free gold on copper plates and resulted in a little over \$16 gold yield per ton. Tunnel A is a short distance from tunnel B. Work has been resumed driving for the lode.

BALTIMORE.—The laying and introduction of the water pipe, from the Water Co.'s flume to the Baltimore Hoisting Works, a distance of 2800 feet, was completed yesterday. The retimbering and repairing of the shaft is completed from the 225 level up 100 feet, leaving 125 feet yet to be done extending to the surface. A hand windlass has been, and is being, used in this work, and until it is completed to the surface the main hoisting works will not be steamed up, although everything is in most perfect order for immediate work; no better plant of machinery for the purpose ever existed on the Comstock. The first attack for practical ore extraction will be on the 225 and 450 levels.

BEST AND BELCHER.—600 level—East crosscut No. 1 was advanced 10 feet, making a total of 737 feet in length. The west crosscut opposite east crosscut No. 2 is in 60 feet. 800 level—East crosscut No. 2 has been advanced 30 feet, making a total of 177 feet. The material in the drifts mentioned is all vein porphyry, with streaks of clay and quartz.

ALPHA AND EXCHEQUER.—The new gallows frame is up, also the surface buildings, and the upper portion of the Alpha shaft is being retimbered and repaired preparatory to the resumption of work in both mines through this shaft, with a view to the development of extensive bodies of ore found before the flooding of the lower levels of these and all the other Gold Hill mines through the great influx of water tapped on the 2800 level of the Exchequer mine.

CHOLLAR.—350 level—The main south lateral drift, south from the Sharon shaft, progresses well in good and promising vein matter. The upraise being made in the high-grade ore vein developed near the Potosi line is up about 25 feet, continuing in the same quality of ore. The clearing out and retimbering of the old main shaft still actively progresses, and is completed to the depth of over 400 feet.

OPHIR.—1300 level—From the south drift, corresponding with the 1435 level of the Con. California and Virginia mine, east crosscut No. 1, 200 feet north of the Ophir shaft, has been extended 32 feet, making a total of 76 feet. Material, vein porphyry with streaks of quartz.

GOULO AND CURRY.—425 level—The south lateral drift from the main west drift has been cleaned out and retimbered an additional distance of 40 feet, making a total length of 425 feet. Material in face clay, quartz and porphyry.

ALTA.—700 level—Good advancement is being made in the main south lateral drift, skirting along the east side of the Keystone vein. The crosscut west in the Lady Washington ground is in 33 feet, 18 feet of which is in quartz, showing bunches and streaks of good ore—a very encouraging prospect.

QUINN MINE.—Work is going ahead lively in the erection and placing of the new hoisting works preparatory to repairing the old shaft and sinking 100 feet deeper, or to the depth of 300 feet.

SIERRA NEVADA.—520 level—West crosscut No. 5 was advanced 30 feet, total length, 50 feet. North lateral drift No. 3 has been started from this west drift No. 5, and is now 49 feet in length, with its face in vein porphyry and quartz, which gives low assays.

UNION AND MEXICAN.—1300 level—Good progress is being made running the joint north lateral drift; also, in the crosscut east from it, the material in the face of both drifts being very favorable vein formation.

BULLION.—The reopening and repairing of the old Croesus shaft is being energetically prosecuted. The new machinery works smoothly and well, and everything goes ahead effectively.

UTAH.—472 level—Main west drift continues its usual rate of progress in good-looking vein material. A north drift started from this main west drift is in 45 feet—same material.

YELLOW JACKET.—Daily yield 50 tons low-grade ore. The explorations of the 1400 level through the incline and main north level show nothing of interest as yet.

CROWN POINT AND BELCHER.—Daily yield 150 tons from the 1600, 1700 and other levels above. The old stops hold out well and are liable to for years to come.

EAST BEST AND BELCHER.—Repairing shaft and hoisting works building preparatory to the energetic resumption of work.

JUSTICE.—350 level—Some rich gold ore was found last Tuesday in the south drift. The vein is four feet wide and gives very high assays.

NORTH GOULO AND CURRY.—Commenced to sink and reopen the shaft with two shifts of men. Everything working favorably.

ANDES.—230 level—The repairs and cleaning out of the main west drift makes good progress.

SILVER STAR.—A first-class new whim for hoisting purposes is being put up over the shaft.

KENTUCK.—Daily yield 50 tons, principally from the 800 level and contiguous points.

OCCIDENTAL.—The north drift from the north incline winze, 48 feet below the track floor of the upper tunnel, has been advanced to a total extent of

51 feet. About 18 tons of low-grade ore have been extracted during the week. The upraise above the lower tunnel has been advanced 10 feet, making a total of 28 feet.

Dun Glen District.

A PROBABLE SALE.—*Silver State*, Dec. 23: There is a probability of the Thomas & Hendra mill and mine at Dun Glen being sold to an Eastern company. The owners are not at all anxious to dispose of it, but will sell if they get their price. The mine is worked exclusively for gold, and there is no discount on that metal.

Mount Rose District.

CONCENTRATIONS SHIPPED.—*Silver State*, Dec. 27: E. Reinhart & Co. shipped 28,200 pounds of concentrated ore from the Paradise Valley mine, to Argo, Colorado, yesterday.

Mt. Cory District.

AT WORK.—*Walker Lake Bulletin*, Dec. 29: There are now 19 men employed in the Mount Cory mine. Nearly all the assessment work has been done in the district. Lew Finney has been doing holding work on the Enterprise, Jumbo and Webfoot. The North Star mine is looking very well at present. There is a 4½-ft. ledge of \$45 ore. W. H. Adams, of Bodie, will soon become a resident of Coryville and will do the assaying for the company and for others.

Ophir District.

BULLION.—*Belmont Courier*, Dec. 25: The Chicago Mining and Reduction Company shipped four bars of bullion on Monday, valued at \$4186.18. The output of bullion from this company's mine in Ophir is steady. The mine is looking well and is being worked in a systematic manner under the able management of Superintendent T. A. Oliver.

Pioche District.

BRIGHTER DAYS.—*Pioche Record*, Dec. 24: There certainly seems a warmer current of air hovering in the atmosphere over Pioche just now. Poor old crippled Pioche, once the gem of the sagebrush country! Is she about to emerge from the long and dreary night of inactivity that has oppressed her? We fervently wish so. Whether or no the benign influence of the sun's rays, or maybe the sound of running machinery and the tooting of whistles have a tendency to render the atmosphere more genial, there is one thing that is quite evident—the pulses of the old camp are quickening a little day by day.

Tuecarora District.

BELLE ISLE.—*Times-Review*, Dec. 24: Belle Isle and Navajo joint crosscut west, 150-foot level, has been extended 25 feet. Joint crosscut east, same level, has been extended 5 feet. The rock has been very hard.

TORNAOON CUL.—They have started a cut on the other side of gulch to intercept ledge at that point, which will greatly facilitate sinking on ledge.

NEVADA QUEEN.—For the week, west crosscut from the main gangway, 150-foot level, has been advanced 39 feet; total from turn-table, 54 feet. Have cut several small seams, from which comes a regular flow of water. No. 1 shaft has been sunk 16 feet; total depth, 156 feet.

NORTH BELLE ISLE.—North gangway, 300-foot level has been advanced 38 feet. North gangway, 400-foot level has been advanced 17 feet. Water has increased very materially during the week.

Union District.

VEACH SERIES.—*Belmont Courier*, Dec. 22: It is expected that the Veach series of mines in Union district will soon pass into the hands of Cincinnati capitalists, who will work them for what they contain, and not as a stock gamble. If the holders of mines in Union district would only sell at reasonable figures, numerous companies would be operating there to-day.

ARIZONA.

* AZTLAN MILL.—*Prescott Courier*, Dec. 23: Douglas Gray is listing mines that are liable to furnish rock and ores for treatment at the Azatlan mill, Grom Creek. Mr. Jones has, we hear, purchased the mill and intends to add to it every appliance necessary to the successful reduction of ores of all kinds. Sam Powell has of late turned his attention to prospecting banks and bars on the Hassayampa, and assures us that the gravel pays from 2 to 10 cents to the pan. Just now there is not sufficient water to wash the gold out, but the claims are ready and will be worked by the hydraulic process as soon as water comes. Col. Bigelow has sent in to Bones' ore room a very large boulder from the Cany mine, Hassayampa district. This mine has been tested enough to know that its material will pay to work. The *Courier* is now pretty well satisfied that sampling works will be erected and run in Prescott, and that the freight tariff on rich ores will be reduced so as to enable miners to ship ores that will pay \$60, maybe \$50 per ton. Heretofore they have been unable to send away for treatment ores of less value than \$100 per ton. N. L. Griffin is down from Walker district. He tells us that Mr. Moore and his partner will shortly ship to Colorado several tons of ore that will pay \$400 per ton silver. He is confident that the Howell works will be fixed up and run next spring. A lot of sacks were sent to the Catocin mine yesterday and a large shipment will soon be made. Placer miners sent in \$3000 worth of dust last week. This amount was saved in rockers.

IDAHO.

THE MONTEZUMA.—*Wood River Times*, Dec. 26: D. J. Johnston, who leased the Montezuma mine, adjoining the Guy, from Cecil B. Palmer, some months ago, has succeeded in uncovering a pay streak that promises exceedingly well. It was not much thicker than a knife-blade at first, but in running along it a few feet the streak widened out to fully 10 inches, and is still widening. Mr. Johnston brought in about one and one-fourth tons last week, for a sample. It sold at the rate of 180½ ounces silver and 33 per cent lead per ton. He intends to ship a carload lot soon.

THE MINNIE MOORE MINE.—It is stated that, with the payments made since the 1st instant, all the debts outstanding against the Minnie Moore mine have been paid off. These, as far as can be ascertained, exceeded \$300,000, and they have been paid since last June, or within six months. Besides the debts, a large profit has doubtless been realized

by the owners—so that the net yield for the six months just passed may safely be placed at \$500,000. Half a million dollars! That is a splendid showing indeed, and one that will go far toward rehabilitating Wood River in the estimation of investors. But the best is yet to come, because the Minnie Moore is scarcely opened yet. When fully opened, its yield will probably reach half a million dollars per month.

THE GUY MINE.—A letter received from Toledo, Ohio, three days ago, made inquiries concerning the cost of work, including the machinery required to sink the Guy mine to a depth of 500 feet, and stated it to be the purpose of the principal owner, Fred J. Scott, to come out here early next spring, to begin the work of systematic exploration of the property. The Guy is located at the head of Rock creek, near the Montezuma, Belle of Idaho, and other well-known claims, and is good property. Several lots of high-grade ore have been extracted from it, which sold for several hundred dollars per ton.

COLORADO

REO MOUNTAIN MINES.—*Cor. La Plata Miner*, Dec. 20: At the Guston great activity is noticed. It is being worked under the able management of Mr. Wm. Gray, with Harry Ellis as foreman. The company at present employs 30 men, which force is well distributed, in sinking the main shaft, drifting on the third level and cutting a chamber for the new boiler. No ore is being taken out, but the quantity in the stopes is immense, and look out for large shipments in the spring.

THE VANDERBILT MINE.—Since this mine relapsed into the hands of the original owners, it has steadily improved in both grade and quantity of ore. Perry Terpenning is now in charge. The property will be equipped this winter with a fine plant of hoisting machinery, as the shaft is getting too deep to windlass with profit.

MONTANA.

NOTES.—*Inter-Mountain*, Dec. 23: The Elm Orlu mine, owned by W. A. Clark, is said to be a veritable bonanza. The North Granite is looking very well. The tunnel is in about 175 feet. There are good indications, but there is no stock on the market. A rich strike is reported in the Pilgrim mine in the Cherry Creek district. The property is owned by the Bozeman Gold and Silver Mining Co. Elling & Morriss are the fortunate possessors of several promising mines at Poney, and are getting a supply of ore ready for reduction in their mill, which is run by water power. The Golconda, in Madison county, is quite well developed and the ore in sight is variously estimated at from 10,000 to 15,000 tons, much of which is high grade though somewhat base. At Clark's Colusa, in Meaderville, the hoisting works have been temporarily closed to admit of needed repairs in the boilers and parts of the machinery. During the time occupied in this work the shaft will be trimmed up and timbered to the bottom, and the mine placed in good shape for another long run. There is a magnificent lot of ore on dump, and the smelters will be kept busy at work.

THE PARROTT SHAFT.—*Butte Miner*, Dec. 25: A *Miner* reporter yesterday visited the Parrott mine and learned that at present, in addition to mining 275 tons of good ore per day, the superintendent was working three shifts of men sinking an additional 200-foot shaft, which he hopes to have completed by the first day of May, 1887. This shaft will be timbered throughout in best style. When completed, the total depth of the Parrott will be 630 feet and then crosscutting for the lead will proceed and the mine fully developed. The Parrott is beyond doubt one of the best timbered mines in Montana, and its condition is due wholly to the excellent judgment of Superintendent Tibbey, who has had the management of it since May, 1881.

NEW MEXICO.

MINING SITUATION.—*Socorro Bulletin*, Dec. 23: The attention which the mines of Socorro county and of New Mexico generally are receiving in the East exceeds that of any time in the history of this Territory. There are not less than '20 mining deals on foot in St. Louis alone, at this time, in which Socorro county properties are involved. Two European syndicates are also interesting themselves in our midst, and in summing up to the total amount involved in these negotiations it makes a sum exceeding \$700,000 cash. If we do not enter into details it is due to the fact that a number of these negotiations are still under way, and by giving them publicity we might put the back-capper on the alert and thus nip in the bud the progress of legitimate business transactions, and the development, in the vicinity, of meritorious mining claims.

UTAH.

REVIEW.—*Salt Lake Tribune*, Dec. 24: The receipts in this city for the week ending the 22d instant, inclusive, were light, being to the value of but \$26,357.53; of bullion, \$72,822.66; of both, \$99,180.19. For the previous week the receipts were \$141,338.35 in bullion and \$45,989.93 in ore, a total of \$187,328.28. The output of the Ontario for the week was 17,734.20 ounces fine bullion, and \$8704.46 from ore sales, a total of \$26,438.66. The Daly produced for the week seven bars of bullion, 9866.51 fine ounces. No ore sales. Fine bar receipts for the week were \$30,682.66; base bullion, \$12,300. The Hanauer smelter product for the week was \$23,510 in bullion. The Bannock sent down two shipments of bullion during the week, of the aggregate value of \$3776. The Stormont sent up on the 18th silver bars to the value of \$2554. Ore receipts in this city for the week were \$11,800 by Wells, Fargo & Co.; \$11,285 by McCormick & Co.; \$3272.53 by T. R. Jones & Co.

ORE AND BULLION SHIPMENTS.—During the week the Macintosh sampler received 245,790 pounds of Ontario ore, 230,390 pounds of Daly and 11,280 pounds of Sampson ore; total, 487,460 pounds. The Ontario shipped during the week 29 bars of bullion, containing 17,734.20 fine silver ounces. The output of Daly bullion from the Marsac mill was 7 bars on the 20th instant, containing 7790 fine ounces of silver, and yesterday the product was 6 bars, containing 6788 fine ounces.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 252 Market St., S. F.

OR WEEK ENDING DECEMBER 21, 1886.

354,691.—SAW SETTER AND SHARPENER—J. P. Cobb, College City, Cal.

354,703.—SHINGLING SEAT—C. B. Huestis, Ukiah, Cal.

354,654.—SHEET METAL SEAMING MACHINE—Chas. Puddefoot, S. F.

354,809.—AMALGAMATOR—Rowe, Holmes & Wells, Eureka, Cal.

354,873.—CABLE GRIP—C. T. Ryland, Jr., San Jose, Cal.

354,667.—MOTOR—G. Suuo, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHINGLING SEAT.—Chas. B. Huestis, Ukiah, Mendocino Co. No. 354,703. Dated Dec. 21, 1886. The invention relates to a seat and nail-holder to be employed by workmen in putting shingles upon sloping roofs. The seat differs from what is known as a shingling bracket, as it is independent and movable to any point which may be desired. With this device the operator may move as the work progresses from point to point, having everything necessary for his work with him, and is not dependent upon any fixed staking.

MACHINE FOR SHARPENING AND SETTING SAWS.—John P. Cobb, College City, Colusa Co. No. 354,691. Dated Dec. 21, 1886. This apparatus for filing and setting saws consists of a holder for the saw blades, with a carriage over which it is advanced intermittently a distance equal to the space between the teeth of the saw to be operated on, a file suitably supported, and a means for adjusting it to the proper angle to move it across the line of the teeth of the saw, and a mechanism by which the teeth are set.

MOTOR.—Gustave Sutro, S. F. No. 354,667. Dated Dec. 21, 1886. This improvement in motors is especially adapted for that class which are to be used on street railways where it is desirable to reduce the noise of escaping steam and smoke from the products of combustion as much as possible. It consists of an engine and boiler, the discharge from the exhaust engine and safety valve being conducted into a peculiarly constructed box and passages having baffles plates to check it. By the means employed the noise of the escaping steam will be so muffled and deadened that it will not frighten horses or produce a disagreeable result.

RAILWAY CABLE GRIP.—C. T. Ryland, Jr., San Jose. No. 354,873. Dated Dec. 21, 1886. This grip for cable cars consists in jaws having the outer edges binged or journaled in a suitable framework, and the inner edges formed or provided with shoes, which are adapted to grasp the cable when the edges of the jaws are moved toward each other in a segment of a circle turning about their hinges or journals. In connection with these jaws are adjustably flanged rollers, which serve to pick up the cable and direct it so that the jaws may grasp it. The operating shank travels in guides extending downwardly from the car to the grip frame, and this shank is connected with the inner edges of the gripping jaws by links, so that when drawn upward the jaws will be closed and when dropped they will be opened.

SEAMING MACHINE FOR SHEET METAL.—Chas. Puddefoot, Oakland. No. 354,654. Dated Dec. 21, 1886. This invention relates to that class of machines which are used for joining the edges of sheet metal together and which are usually known as "seaming machines." The particular seam which this machine is adapted to make is the ordinary one made by bending the edges of the two plates or sheets in opposite directions and then pressing them together over and down to a flat plane, in which the two edges are interlocked. The invention consists in an upper and lower die stock carrying various bars and anvils, and to which movements and adjustments are given by which the overlapping edges of the two sheets or the opposing edges of the same sheet are first bent in opposite directions, then brought and held together, and finally pressed over and down flat to form the seam.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

PARKE & LACY, General Agents, San Francisco, Cal.

MACHINE TOOLS, PRESSES AND DIES, PUNCHING and SHEARING MACHINERY.**F. A. ROBBINS,**

...MANUFACTURER OF...

Canners' and Soap-Makers' Presses and Dies, 20-inch Engine Lathes, 12-inch Shapers.

Punching and Shearing Machinery for Hydraulic Pipes.

SHAFTING, HANGERS, AND PULLEYS.

Gear Cutting a Specialty.

221 and 223 First St., San Francisco.

**WATER TANKS! WINE TANKS! CALIFORNIA WINE COOPERAGE CO.**

FULDA BROS., Proprietors,

30 to 40 Spear St., San Francisco.

ALL KINDS OF CASKS, TANKS, Etc.

SHIP, MINING, and WATER TANKS a Specialty.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 252 Market St., San Francisco.

THE CONSUMERS' COMPANY.**VULCAN B B AND AJAX.**

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.

218 California Street, San Francisco, Cal.

**THE GIANT POWDER COMPANY**

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims. It breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.**SELBY****SMELTING and LEAD CO.,**

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

...MANUFACTURERS OF...

BLUESTONE,**LEAD PIPE,****SHEET LEAD,**

SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges, Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.
Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.
BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St.
NOTICE.—Mining men are cautioned against purchasing inferior quality of Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these poor plates cost.

F. A. HUNTINGTON,

MANUFACTURER OF

Centrifugal Roller Quartz Mills, CONCENTRATORS AND ORE CRUSHERS,

Mining Machinery of Every Description,

Steam Engines and Shingle Machines.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

Send for Circulars and Price List.

Inventor and manufacturer of the celebrated Shot Out and Slot Punched Screens. Mining Screens a Specialty, from 1 to 15 (fine).
Orders Promptly Executed

Mining Share Market.

Christmas was followed by rather a sharp break in stocks, some of them going down quite low. The leading producing mines are still, however, selling at good prices. The fire in the Con. California and Virginia has occasioned considerable trouble, mainly from gases. This fire in the worked-out bonanza stopes was cut into by an exploring drift on the 1600 level. It has been securely bulkheaded at that point, but the fresh draft of air it received revived that old fire very materially, so that it has been an arduous job to again hermetically segregate it so to speak, as it was before. It is no easy matter for men to work in drifts full of deadly carbonic acid gas, and more than one or two cases of asphyxiation occurred. Big wet sponges, covering the mouth and nostrils, and even Van Dusen bead-pieces or helmets, same as was used by Van Dusen when he went to the rescue of the miners shut into a drift in the lower levels of the Alta mine four or five years ago, were called into requisition in the arduous work of bulkheading out the fire and the gas. But incessant vigilance and excellent management have at last overcome this temporary difficulty. The only points affected by the gas are the 1650, 1500 and 800 levels. The gas is now being handled so that but little further trouble is expected. Work will therefore go on as before. At the Ophir the operations have been confined to bulkheading the connections with the Consolidated California and Virginia old stopes and repairing drifts. This shows that little or no progress toward the development of ore has been made in the Ophir mine.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

RIVERSIDE LIGHTING CO., Dec. 24. Object, lighting and heating of the town of Riverside, San Bern rmo county. Capital stock is \$40,000. Directors—H. M. A. Miller, W. B. Cline, C. O. G. Miller, J. M. Livingston, Joseph Hutchinson.

NATIONAL CITY AND OTAY R. R. CO., Dec. 28. The route of the road is from National City, San Diego Co., to Otay, Cajon, Chollar and Spring Valley, 50 miles. Capital stock, \$100,000. Directors—W. G. Dickinson, Frank A. Kimball, Warren C. Kimball, Samuel J. Bailey and Charles L. Josselyn.

MOORE & MORGAN M. CO., Dec. 29. Capital stock, \$10,000,000. Directors—James H. Crossman, R. Clute, J. H. Sayle, William Dutch and Nahum Mason.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Cou. California and Virginia, Dec. 26, \$85,000; Eureka Con., 29, \$17,000; Alice, 24, \$21,648; Moulton, 24, \$19,200; Hanauer, 21, \$5,150; Bannock, 21, \$19,400; Hanauer, 23, \$24,300; Alice, 25, \$9,042; Hanauer, 24, \$23,500; Stormont, 24, \$27,600; Queen of the Hills, 24, \$44,500; Hanauer, 25, \$4,800; Bannock, 25, \$3,550. The metal shipments out of Salt Lake City for the week ending Dec. 25 (short a day on account of Christmas) were 14 cars of bullion, 355,688 lbs.; 6 cars lead, 173,600 lbs.; 12 cars silver ore, 405,850 lbs.; 7 cars copper ore, 199,000 lbs.; total, 39 cars, 1,134,138 lbs. In bullion Wells, Fargo & Co. shipped \$54,786; McCormick & Co., \$41,725; and Jones & Co. \$32,724.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in
adjustment than any other. Feeds coarse ore or soft clay
alike uniformly, under one or all the stamps in a battery
as required.

In the Bunker Hill Mill it has run continuously for two
years, never having been out of order or costing a dollar
or repairs.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Cokes having been sold
in this and other countries under the name of "Patent Cokes," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Cokes," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

THE ORIGINAL Roller Ore Feeder

This form of Ore Feeder is well adapted
for its peculiar work.

In reference to a similar form of "Roller" Feeder,
which is being manufactured and offered for sale in this
city, and of which a cut appears in this journal, we have
to say that the Superintendent of the Bunker Hill Gold
Mining Company states that the "Challenge" is far su-
perior to the "Roller," he having had both of them
operating side by side. We shall be pleased to show this
letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and
"Standard Improved."

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco.

ORE FEEDERS.

We direct attention to an advertisement, which ap-
pears in our journal, of the "Original Roller" Ore
Feeder, manufactured by the "Joshua Hendy Machine
Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder,
known as the "Templeton Roller," claim that it is su-
perior to any other style, and cite those in operation at
the "Bunker Hill" mill in Amador county, we expressly
contradict the statement, and in substantiation submit a
copy of a letter addressed to us by a representative of the
"Joshua Hendy Machine Works," which speaks for itself

BUNKER HILL GOLD MINING CO.,
AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont
St., S. F.—GENTLEMEN: We have used the "Challenge"
and "Roller" or "Templeton" Ore Feeders in our mill for
the past three years, and I am free to say that I con-
sider the "Challenge" far superior to the "Roller."
Feeder, in that most important of all things in a quartz
mill, namely, the regular feeding of ore to the bat-
teries. If the "Roller" Feeder is regulated to feed finely
pulverized ore, the coarser ore will choke the outlet
of the Feeder, and no ore can reach the batteries. If, on
the other hand, it is regulated to feed coarse ore, then
the fine ore when it comes will elude right through and
fill the batteries. The "Roller" Feeder requires constant
attention. Yours truly,
(Signed) N. W. CROCKER, Supt.

A CHANCE TO INVEST.

A patent was granted me Sept. 9, 1886, on a STATION
INDICATOR. The design of the invention is to show
passengers on railroads or street cars the names of sta-
tions or streets when or before they arrive at them. A
bell gives warning, and at the same time a hand on a
dial-plate points to the name of the next street or sta-
tion. The working has been tried and proved successful.
The inventor is desirous of forming a company to get
further patents, and to manufacture and introduce the
article in the U. S. of America. For further information,
address,

G. H. BADE,
Prescott House, San Francisco.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), London, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

RANKIN, BRAYTON & CO., BUILDERS OF..... MINING MACHINERY.

San Francisco: 127 First-Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED AS VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FUEL being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man at the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

SAN FRANCISCO, SATURDAY, JANUARY 8, 1887.

VOLUME LIV
Number 2.

Academy of Sciences.

The annual election of the California Academy of Sciences was held on Monday last, at which the following officers for the year were chosen for 1887: President, H. W. Harkness; First Vice-President, H. H. Behr; Second Vice-President, G. Hewston; Corresponding Secretary, A. Ferrer; Recording Secretary, Chas. G. Yale; Treasurer, John Dolbeer; Librarian, Carlos Troyer; Director of Museum, J. G. Cooper. Trustees—Charles F. Crocker, Thomas F. Madden, J. M. McDonald, E. L. G. Steele, S. W. Holladay, D. E. Hayes and E. J. Molera. The only officers of the "regular ticket" elected were Messrs. Madden, McDonald, Charles F. Crocker, Troyer and Yale, the others having run on the "reform" ticket. Many of the oldest officers were deposed. The new officers promise a number of improvements in academy affairs, among them the construction of a new building for the collections. The lease of the present building runs only two years more.

The Treasurer made the following report for the year 1886: Receipts, \$12,357.58; disbursements, \$9912.60. In the General Fund the receipts were \$10,806.56; disbursements, \$8912.60; leaving a balance on hand of \$1893.96.

The Corresponding Secretary, S. B. Christy, reported concerning the correspondence attended to during the year—417 letters sent, 530 received; 1247 copies of the two bulletins published had been delivered to members and societies. Librarian C. Troyer reported that library matters were very active. The academy had received 2401 publications against 960 the previous year. Of these, 1933 were from corresponding societies, 384 by donation, 189 exchange of duplicates and 66 by purchase.

It is but just to state that the large increase was due mainly to the activity of Assistant W. Churchill, who had extensive correspondence with other societies with regard to exchanges, etc. This gentleman has also written about 45,000 cards for the card catalogue of the library this year, and there are now 125,000 cards in the index. Many hundred volumes have been bound of late. The library was never in better condition, and it is to be hoped that this work will be continued until all the subjects are indexed.

Wm. Churchill, secretary of the Board of Trustees, read the report of the Board. This upheld and defended the policy pursued by the officers, stating that the blame for the non-removal of the academy to dryer and more commodious quarters lies with the academy at large, and not with the trustees; because when the trustees desired to move, a committee appointed by the academy to confer with them had opposed moving, and prevailed upon them to remain in the old building awhile longer. This report also detailed the financial statements. It showed that the only salaries paid from general fund were to Mr. Harford, the director of museum, and Mr. Churchill, assistant librarian. From the Crocker Scientific Investigation Fund, Mrs. Mary K. Curran had

received \$40 per month for the year, and Dr. A. Kellogg the same. A small sum was also paid C. D. Gibbes.

The retiring president, Professor Davidson, in his report, stated that during the 19 years he has been connected with the academy he can recall no year where better work has been done, and asserted that the character and not the quantity of the work done is the true measure of a scientific body. He also complimented the younger members for the way they were coming to the front, and spoke of the various contributions to the bulletins.

QUIJOTOA.—We are told that matters are looking up at Quijotoa, Arizona. The Loco-

The Improved Mining Wheel.

We give an illustration on this page showing the application of the James Leffel improved mining wheel, for creating blast in smelting furnaces in the mining region. The wheel is represented as driving a blower for the furnace. As may be inferred from its name, the wheel is more especially designed for furnishing power for mining purposes; yet its completeness and extreme simplicity of arrangement highly commend it as a motive power for any purpose where it is desired to utilize medium and high heads of water. These wheels are frequently placed under heads ranging from 250 to 300 feet, and, in order to prevent the heating of the

Average Yield of Quartz.

A few months since we gave an article which showed the cost of milling gold quartz and the average yield in different parts of the world, and cited several examples of gold milling in California. We are enabled to crush and work gold ore here now at a reduced expense from what was formerly the case. In looking over some old files recently, we saw, however, that quartz was milled for \$4 per ton at Grass Valley, in 1855 and 1856, at company's own mills, though they charged \$6 per ton for custom work. At the mines there, at that time, drifters got \$3.50 per day, foremen \$4, windlassmen \$3, and carmen \$3. Much of the quartz yielded at the mills in those years pretty good figures. Lots from the Missouri Hill yielded as follows: 72 tons, \$40 per ton; 110 tons, \$26 per ton. Sebastopol mine, 27 tons, \$111; 29 tons, \$80; 33 tons, \$60; Allison ranch mine, 21 tons, \$370 per ton; Houston Hill, 22 tons, \$60 per ton; Gold Hill claim, 226 tons, \$23 per ton; 12 tons, \$117 per ton; 61 tons, \$40.30 per ton; 157 tons, \$50 per ton; Osborne Hill claim, 5 tons, \$60.40; Ophir Hill claim, 57 tons, \$180; Massachusetts Hill, 40 tons, \$28; Rose Hill, 120 tons, \$23; Redan Hill, 39 tons, \$26 per ton. All these crushings were made in the Gold Hill mill at Grass Valley, of which Mr. Melville Attwood was manager at the time.

At the French mill, same place, lots of ore yielded as follows: Ophir mine, 146 tons, \$94.43 per ton; Sebastopol, 263 tons, \$39 10; Wisconsin, 58 tons, \$45.12; Rich Hill, 40 tons, \$34; Massachusetts, 90 tons, \$180; and 17 tons, \$140 per ton. At this same custom mill the Mt. Hope lead had 2000 tons crushed which yielded \$55 per ton; different leads on Gold Hill 4000 tons, yielding \$18 to \$20 per ton. The greatest number of veins from which small lots of ore were received, yielded rock which returned from \$12 to \$16 per ton.

Some mills in those days used Stetson amalgamating stirring bowls and quicksilver troughs, though the main dependence was placed on blankets. In front of the sieves was a small trough and then came the blankets, and 75 per cent of all was saved before leaving the blankets. Reference to this blanket process is made in another column. Very little amalgamation was done in the battery in early days at Grass Valley, and no copper plates were used.

SALES OF POWDER in this market last year were about 20 per cent larger than in 1885. This, however, was partly due to low prices. A local trade journal says that the trade for the past year consisted principally in dynamite in various forms, modified to suit the needs of the market. The total quantity of dynamite made during the year was about 6,000,000 pounds. The manufacture of black powder during the year has not exceeded 80,000 kegs. The powder pool will not expire until July.

LEFFEL'S MINING WHEEL ATTACHED TO SMELTING FURNACE.

motive Mining Co. has leased 10 stamps of the Peer and Peerless Mill, and is building a road to the mills. This road will also admit of the Weldon people shipping their ore to the mill. The Peer and Peerless sold out their stock during the rise, which had been taken in for assessments, and have been enabled to pay off their debts.

LICK LECTURES.—During the year it is proposed by the Society of Pioneers to request several gentlemen to deliver addresses, to be known as Lick Lectures, relative to early adventures by land and sea in California. Among others, the following gentlemen have been invited to narrate their experiences: S. J. Field, Lorenzo Sawyer, Ogden Hoffman, Prof. George Davidson, Peter Burnett, Dr. James Simpson and Dr. Washington Ayer. The first lecture was delivered at Pioneer hall this week by John S. Hittel, upon "The Plains and Mines in 1849."

THE issue of standard silver dollars from the mints during the week ended Dec. 31st was 511,666, and during the corresponding period of last year 476,684. The shipments of fractional silver coin during December amounted to \$637,405. The coinage at the mints during December was \$4,814,522, of which 2,550,261 were standard dollars,

journals which would otherwise result from the high speed at which the wheels run, a new device has been applied in the way of anti-friction oil bearings, surrounded by water boxes.

The method of application and connection of the wheel to the work are so clearly shown in the illustration that no further description is necessary. The only requirement is a good, firm foundation on which to place the wheel, which communicates the power direct from a small pulley on the end of water-wheel shaft, by a belt, to a larger pulley on the main line shaft, all intermediate gearing being thus dispensed with. A large number of these wheels are in operation throughout the mining districts, as well as elsewhere in different parts of the country, and have proved themselves durable, easily managed, highly efficient, and economical in the use of water. Full particulars in regard to this wheel, together with a finely illustrated catalogue, may be had by addressing the manufacturers, James Leffel & Co., Springfield, Ohio.

IRON has made a good record in 1886, the imports of wrought scrap iron being 5000 tons larger than in 1885.

New smelting works to cost \$50,000 are to be built immediately at Tacoma, W. T.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Roasting and Leaching of Silver Ores.

Notes of the Practice at Las Yedrae, Sinaloa, Mexico.

NUMBER 2.

[Written for the Press by CARL A. SCHENK.]

In working the ore the long-handled hoe and rakes are supported by an iron roller fastened to the frame of the working door and revolving around a horizontal axis. A hollow space, of rectangular shape, is left out in the masonry of the first hearth, into which the roasted charge is dropped through a circular hole in the floor, which, excepting the short time of dropping the charge, is closed with a cast-iron plate covered over with ore. From the floor of the furnaces the ore is conveyed to lower levels by means of chutes, there to be sprayed over with water before being transferred to the leaching.

The wood used in roasting consists of oak and pine; the sticks are about two feet long and varying in thickness from two inches to half a foot through. The thick pieces are split, but not sufficiently small to correspond in heating and flame-giving effect to the lighter pieces which the workman slings with ease into the fire. Oak is preferred to pine: the first producing in its combustion a clear, yellow flame, which, with a rolling motion, passes through the first hearth between ore and arch, entering about half-way into the second, at and from which point it commences to fade, losing its distinct character. Pine gives a longer flame, not of a clear, yellow color, like that from oak, but mixed with black, sooty streaks, and filling the hearth with smoke, especially in firing up.

A Charge in the Furnace.

After a charge has been dropped from hearth 1, all the others on the hearths behind it are advanced in the process of roasting. Charge from hearth 2 is now moved to 1, charge from 3 is moved to 2, and a new charge is dropped from the hopper into the last hearth, after room has been made for it there. The charges on the different hearths of a furnace differ consequently in regard to the length of time they have been in the furnace and state of roasting. In regard to length of time during which a charge remains on any one hearth, excepting the first, the workmen are to some extent guided by the progress of the work on the first hearth. Under the present system of roasting, it takes about two hours to finish a charge on the first hearth of furnace 1, which has altogether five hearths, not including the time of moving over from 2 and dropping, so that the following practical rule for this furnace has been adopted. A charge in the furnace before it is moved, remains about two hours on any one hearth. Yet it must not be understood from this that the roasting foreman is solely guided by time in judging if a charge should be dropped; by taking samples and noting the physical changes of the ore, he watches principally the progress of roasting and gives his order to drop if the appearance of the last sample informs him that it is time.

An answer to the question of what nature are these physical changes from which he can tell that a charge is done, is difficult, inasmuch as only a practiced eye is quick in observing them, and a description of them is not easy. A sample of finished ore, coming red hot out of the furnace, must assume throughout, in the first stage of cooling off, a lively light coffee-brown color, so that no streaks or specks of unchanged or only partially changed sulphurets can be detected. The raw pulp is of a bluish-gray color. The use of the microscope, or at least the magnifying glass, might be of service here. And the sample of roasted ore, coming red hot out of the furnace and immediately held to the nose, must give up a peculiar, faint smell, sweetish as it is termed. As crude as these tests appear, they are nevertheless valuable in practice, and the best results are obtained whenever these physical changes are noticed in their highest perfection; the silver loss in roasting is small and the percentage of chlorination high.

Considering that the ore contains so much arsen, it may be said without fear of contradiction that the silver loss even in the best case must always be considerable, and the percentage of chlorination comparatively low; the volatile arsenurets disposing the silver also to volatilization and the arsenate of silver not being changed to chloride. These evil effects are increased on account of the fact that the gangue consists mostly of lims, which, in roasting, being converted to sulphate, consumes a proportion of sulphuric acid, which is lost and inactive in the development of chlorine gas.

This following special notes are collected from

A Roasting Experiment.

And may be of interest to the mining public: Furnace 1, containing five hearths in one plane, was selected for the experiment. In making it, a charge was followed from hopper through the furnace till it was dropped from the first hearth. Samples were taken about every half hour and subsequently assayed to ascertain the

loss and percentage of chlorination of silver and the gradual progress in roasting.

First sample.—Taken from hopper at 7 A. M., is of a bluish-gray color and assays 61.02 ounces in silver. The charge of raw ore (without the salt) weighs about 1950 pounds. After being dropped on the floor of the 5th hearth it is spread out in an even layer and the door closed to give the ore a chance of heating up, whereupon it is worked with the hoe.

Second sample.—From hearth 5, at 7:30 A. M., assays 60.36 ounces. Ore has not yet changed color; arch of the hearth dark; ore also dark on its surface, glowing very faintly inside.

Third sample.—From hearth 5, at 8 A. M., assays 58.80 ounces; gives up a slight smell of sulphur; color of the ore not changed; few sparks in passing hoe through it; arch still dark; ore dark on its surface.

Fourth sample.—From hearth 5, at 8:30 A. M., assays 60.30 ounces; sample is dusty; color is changing to light gray; smell of burning sulphur increasing; arch is getting faintly dark red, and in stirring the ore faintly, dark red portions are turned up; the ore moves from the blades of the hoe like running water; more sparks.

Fifth sample.—From hearth 5, at 9 A. M., assays 64.20 ounces; color of ore light gray, giving up strong smell of sulphur; arch is faintly dark red all over; ore, though yet rather dark on surface, shows faintly dark red throughout in being stirred. At 9:15 A. M. charge is moved to hearth 4.

Sixth sample.—From hearth 4, at 9:40 A. M., assays 64.20 ounces; color of sample light gray; very strong smell of sulphur; arch dark red; ore dark red on surface; many sparks in being worked; dusty, runs from the blades of the rakes like water; the pale blue flame of burning sulphur is noticed.

Seventh sample.—From hearth 4, at 10:20 A. M., assays 64.08 ounces; color of sample light gray; ore dusty; very strong smell of sulphur; arch dark red; ore dark red on surface, brighter inside; white fumes are rising in working the ore; is being moved to the 3d hearth.

Eighth sample.—From hearth 3, at 11 A. M., assays 64.56 ounces; color of sample grayish brown, turning again into gray in cooling; smell of burning sulphur much weaker, and fewer sparks; arch dark red; ore dark red on surface, brighter inside; white fumes are rising in working it; 7 per cent of salt is now added and rapidly worked into the ore, whereupon it is left undisturbed for awhile.

Ninth sample.—From hearth 3, at 11:30 A. M., assays 58.56 ounces; color of sample grayish-brown; no smell of burning sulphur; no sparks; arch dark red; ore dark red on surface, brighter inside.

Tenth sample.—From hearth 3, at 12 noon, assays 60 ounces; color of sample light brown, with gray in it; no smell of sulphur; no sparks; arch red; ore red and increasing in bulk; is getting woolly; does not run any more like water before the blade of the hoe; few white fumes are rising out of the ore.

Eleventh sample.—From hearth 2, at 12:45 P. M., assays 59.64 ounces; percentage of chlorination 31.6. Taking of sample delayed on account of moving charge from hearth 3 to hearth 2. Color light brown, with gray in it; no smell of burning sulphur; no sparks; the woolly-looking charge has much increased in bulk; white fumes are rising from the surface of the ore in this hearth, mixing with those carried over by the draught from the first hearth. The ore is continuously worked.

Twelfth sample.—From hearth 2, at 1 P. M., assays 58.02 ounces; percentage of chlorination 30.1; color of sample light brown; white fumes are rising from the woolly-looking ore; arch red; ore red.

Thirteenth sample.—From hearth 2, at 1:30 P. M., assays 58.08 ounces; percentage of chlorination 32.2; color of sample light brown; arch red; ore red and woolly in appearance; fumes rising.

Fourteenth sample.—From hearth 2, at 2:15 P. M., assays 58:20 ounces; percentage of chlorination 47; color of sample light brown; arch red; ore red; fumes.

Fifteenth sample.—From hearth 2, at 2:45 P. M., assays 57.90 ounces; percentage of chlorination, 65.4; sample light coffee brown; moved charge from hearth 2 to hearth 1 at 2:50 P. M.

Sixteenth sample.—From hearth 1, at 3:15 P. M., assays 57.90 ounces; percentage of chlorination 68.4. The ore lies near fire-bridge piled up; arch yellow; ore on its surface red to yellow. Profuse vapors are rising out of the pile.

Seventeenth sample.—From hearth 1, at 3:45 P. M., assays 54.48 ounces; percentage of chlorination 81.9. Charge is moved from fire-bridge at 4 P. M. and banked up on the opposite side of the hearth. Sample shows a light coffee-brown color in cooling.

Eighteenth sample.—From hearth 1, at 4:30 P. M., the banked-up charge lies still on the side opposite to the fire-bridge; assays 53.88 ounces; percentage of chlorination, 85.0; color of sample, light coffee brown; fumes rising from the surface of the pile.

Nineteenth sample.—From hearth 1, at 5 P. M., assays 54.48 ounces; percentage of chlorination, 86.4; the charge has been moved and banked-up again on the side of the fire-bridge; it is now dropped, the appearance and smell of the

sample indicating that it is done; the charge has been in the furnace 10½ hours.

Table of Results.

No. of Sample.	Assay value per ton, in ozs.	Percentage of loss.	Percentage of chlorination.	No. of Sample.	Assay value per ton, in ozs.	Percentage of loss.	Percentage of chlorination.
1	61.02	11	59.64	2.3	31.6
2	60.36	1.0	...	12	58.02	5.0	30.1
3	58.80	3.6	...	13	58.08	5.0	32.2
4	60.30	1.0	...	14	58.20	4.6	47.
5	64.20	5.0 gain.	...	15	57.90	5.1	65.4

10	60.00	1.0	...				

Determining the Loss.

In making the assays to determine the silver loss, one-third assay ton of the well-mixed samples was weighed out, and from the weight of the silver button in each case was determined the silver loss per full ton; assuming, for the sake of quicker work, that a ton of raw ore, plus salt, in passing through the different hearths would not suffer any loss in weight. That this assumption is not correct is evident, and therefore a correction should be applied to get at the right results. To find out what this correction will be, we ought to know the loss in weight on every particular hearth per ton of ore, plus the salt or without it, as the case may be. This loss having only been determined for finished ore from the first hearth and amounting to about 15 per cent, a determination of it for all the other hearths not being necessary nor practicable, we apply this correction to the last result in the table, obtaining a total silver loss in roasting of 24 per cent; or, in other words: One ton of raw ore, which assays 61.02 ounces per ton, weighs only about 1700 pounds after roasting, which quantity contains only 46.31 ounces of pure silver. If no silver had been lost in roasting, these 1700 pounds should also contain 61.02 ounces of pure silver. Of the 46.31 ounces of pure silver, 86.4 per cent are in the form of chlorides and other soluble compounds; the other 13.6 per cent are not soluble in hypo, and remain in the tailings in the subsequent process of bleaching. One cause of this loss has already been pointed out. From the study of the table it may be surmised that better results could be obtained by leaving the ore longer on the third hearth, where the salt is added, and shortening the time on the second and first.

The assay value per ton of the samples 5, 6, 7 and 8 is higher than the same value per ton of raw ore, as appears from the table. This apparent anomaly disappears when we consider that quite an amount of the most volatile compounds has already escaped in this stage of the roasting, whereas no silver or only very little has yet been volatilized.

If it were possible to intercept the fumes of each hearth separately before passing through the flues of the furnace, for the purpose of condensing such quantities as may be needed for analysis and assay, valuable results might be obtained from such a line of investigation. Would a vessel made of boiler iron and of suitable size, filled with water and having an outlet for steam, attached to a long handle, be of service? To be sure that only the fumes of the hearth in question and none of those from the hearths nearer to the fireplace are caught on this condenser, this is a very simple problem.

The percentage of lumps, large and small, formed in roasting, is quite considerable, and another loss in silver is caused thereby, as they are not separated from the well-roasted ore but transferred with it to the leaching.

PREMIUMS FOR PROSPECTORS.—The Carson Index says: A movement is on foot to induce the coming law-makers to offer a premium for the discovery of mineral-bearing lodes in any part of the State of Nevada, the amount to be contingent on the known value of the ore. It must seem to every one a good proposition, and nothing could add more to the benefit of the State, for whenever prominent mines are discovered railroads will extend thereto, and the taxable property of the State be enhanced in value. The above is good and should meet the hearty approval of every one. Toiling day by day, year in and year out, the prospector gets but few thanks for what he has done, or is trying to do—his reward consisting most of the kicks and cuffs, figuratively speaking, of the community at large, and most warmly and liberally bestowed. On being refused grub, he has been known to betake himself to wood rats straight—there being nothing else to eat—thereby adapting himself to circumstances of the most reduced. There is one thing, however, in regard to the prospector of which we will speak in brief. It must be enumerated among his other weaknesses to be the greatest. It is his good nature. If he makes a successful find, and stays in the country long enough, he is bound to go through, his good nature and generous turn of mind rendering him an easy prey of the bloodsucker, who bleeds him out of everything and leaves him in the cold, dependent on the tender charities of the public. The premium is good—and why not pension the prospector, also?—*Pioche Record.*

At the Benicia pottery they have just finished an order for 10,000 stove-linings. New buildings will be erected at these works in this spring.

Increase of Manufacturing Industries.

The increase of manufacturing industries in this country is something really wonderful. Those persons who do not study closely the statistics of manufactures as they are annually presented are not aware that America, as a manufacturing country, is outstripping the world. A contemporary, on this point, aptly says: "Already, six years ago, in 1880, we had surpassed in manufacture by \$650,000,000 Great Britain, hitherto the imperial mistress among nations. So soon did Mr. Gladstone's keen forecast come true that we should ultimately become the head servant in the world's great household. From 1870 to 1880 the manufactures of France increased \$230,000,000, of Germany \$430,000,000, of Great Britain \$580,000,000, while those of the United States increased \$1,030,000,000." That increase is greater than both England and Germany combined, and at this time is no doubt fully equal to all the three leading nations of the world named.

It has been very correctly remarked that "It is more than probable, when the industrial record for 1886 is made up, that the year now drawing to a close will show a greater increase in the mechanical industries of the country than any previous year. Many enterprises have been entered into requiring a very large outlay of capital, and new plants have sprung into existence on a scale much larger than ever before. Indeed, it may be said with certainty that what with the establishment of new industries and the enlargement of the old, there has already been more capital invested in industrial enterprises in this first eight months of the current year than in any previous 12 months in our history." And there are still many others in prospect that will soon be developed in all parts of the country.

The labor troubles and higher rates of wages in this State have been a great drawback to the increase of manufacturing industries in California; but notwithstanding these hindrances, there are constant additions being made to our manufacturing facilities, both by the increase of the old and by the organization of new companies and incorporations.

It might be pertinent to inquire what has induced this large investment of capital here and elsewhere. In answer it might be remarked that the present actual and the future evident return of general prosperity has given manufacturers a feeling of confidence and security which has been lacking for a few years back. Business men, in general, have not been idle spectators of the new impetus recently manifested in the great iron and railroad interests of the country. They know that these large interests have the best means of learning beforehand of a coming industrial boom. The demands for machinery come first—that means an increase in production. Then follows the demand for rails to give additional facilities for the increased demand for transportation. The developments of the past year have shown a capacity for consumption throughout the country which makes assurance doubly sure that our overproduction surplus is well-nigh exhausted, and must be replaced with new goods and wares. This is a class of information which is within easy reach of the thoughtful and observant producer, and he governs himself accordingly.

There is another factor which has had perhaps the most important bearing upon this new departure in business. Business men have observed the hesitation of the last Congress to enter upon a general crusade against any sweeping tariff reform—and that, too, in the face of a very strong free-trade influence in that body. And now we have no hesitation in saying that the stand evidently being taken by the present new Congress will greatly strengthen the position of the active and advances business men of the country. If the efforts of the free-traders had been successful in the last Congress, and their action had been confirmed by the people at the late election, there would have been a hesitation and halt in business which could not have been overcome during the existence of the present Congress at least. Happily the danger is passed and the people breathe free.

Let us have another decade of "American policy" in contradistinction from English policy, and the nation will witness a development of industry that will even eclipse the past two decades, and more than fulfill Gladstone's famous prophecy that we should become "the head servant of the world's great household."

With a proper policy at Washington there is no reason why our industries might not be vastly enlarged, especially in the line of silk, woolen, cotton, linen, jute and ramie, and full employment given to any willing hand that really desires work. This new development will include the entire country, north, south, east and west, and will render the United States of America not only the granary and the workshop of the world, but bye-and-hye the mine, the vineyard, and the orchard as well.

A fine granite quarry half a mile south of Casa Blanca—Riverside—on the California Southern Railroad, has been discovered on lands owned by Mr. S. C. Evans, and leased to Los Angeles parties, who will proceed to open up the same at once. For the present the stone will be delivered at Casa Blanca for shipment, and as the work progresses a side track will probably be put in.

South African Gold.

Fortune-Seekers Pouring Into the Country.

The development of the gold-fields continues to absorb public attention. From every town and village in South Africa, during the past three weeks, a stream of fortune-seekers have wended their way to the De Kaap and Witwatersrand. The population of Johannesburg has more than doubled and is daily increasing; stands for building and business sites are being eagerly purchased there; new syndicates are being formed and new companies floated. The total capital of all the gold-mining companies is stated to be not far short of £2,000,000, while their value, as represented by the ruling share prices, is nearly double that amount. In many cases the realization of returns is a long way off, as there is no machinery immediately available for the development of the properties; in other instances some of the companies have been—even with very inadequate appliances—very successful; and it is this, together with the handsome return from "company promoting," which has been the incentive to so much speculation.

The Sheba Reef Company has presented a report to their shareholders, giving the result of their first six months' workings. It shows that they have crushed 771 tons, yielding 5642 ounces 16 pennyweights 6 grains—an average of 7 ounces 6 pennyweights 9 grains to the ton. The expenses incurred in this transport and treatment of this tonnage (exclusive of mining, which are nominal, the auriferous rock being simply quarried) were as follows: Transport from mine to batteries, £1689 5s; crushing, £1486; total, £3175 5s—a total of 82s 4½d per ton. Taking the value of gold here at 72s per ounce, we have a gross return of £20,031 19s 9d; deduct expenses, £3175 5s, leaving a balance of £16,856 14s 9d. Out of this the shareholders have received in dividends 62½ per cent on the paid-up capital of £15,000. With a view to avoiding the heavy charges for transport and crushing, the Sheba, in conjunction with the Oriental and Nil Dispensary Companies, has arranged for the construction of a tramway from their properties to the crushing mills site, where they intend erecting at least 30 stamps, to be driven by a turbine, to work up to 190 stamps, and when this is completed the exceptional richness of the Sheba Reef will be fully established.

Weekly shipments of native gold from the fields may now be looked for, the Donald Currie steamer of this week taking 4500 ounces of the declared value of £17,150. For this present year the total export will be about £150,000; but next year, when several of the companies will fairly start work, it is estimated that it will advance to at least three-quarters of a million.

On the Witwatersrand fields, between Pretoria and Heidelberg, some of the capitalists of Kimberly have secured gold properties from which wonderful results are also expected. Mr. W. Knight, who has been long and favorably known in connection with successful mining enterprises at the diamond fields, has secured mining rights on the farm of Driefontein, where prospecting work has resulted in the discovery of four conglomerate gold-bearing reefs, giving together an average thickness of about 23 feet, extending over three and a half miles in length, with a proved depth of about 100 feet. Adjacent to this Messrs. Rhodes, Rudd and Caldecott have purchased for £10,000 the properties of Rietfontein and Witkopjes, and several other syndicates and individuals have secured mining privileges in the same neighborhood. When companies are organized and mills set to work it is expected that these fields will give an average return of an ounce per ton, and that the total cost of extracting the gold, mining royalties and other charges will not be more than 15s per ton.

It is pretty well ascertained that the auriferous formation in the Transvaal runs across the country, almost along the parallel of 26° south from the Lehomho mountains on the east to the boundary of British Bechuanaland on the west. The latest reef discovery has been on the Malmani river, near to Zeerust, and only 14 miles from Mafeking.

At the Knysna, within the Cape Colony, it has now been established that gold-bearing quartz veins exist, although the few tests hitherto made have not given great results. From some of the surface quartz only seven pennyweights have been extracted, but selected specimens have yielded equal to four ounces per ton. The government is at the present time having a ton of the quartz crushed and assayed before determining whether the district of the Knysna will be proclaimed as a gold field or not. With the advantage of plentiful wood and water, and near proximity to an excellent port, the Knysna gold-field may prove payable with a much smaller average result than attracts attention at De Kaap and Witwatersrand. —Cape Town Cor. London Times.

A GREAT deal of scrap iron is used at the Pacific Rolling Mills. Quite an active trade is carried on in this scrap, which is gathered up all over the State and sold to the rolling mills. But the State cannot supply the demand. The Pacific Rolling Mill Company informed a reporter that it could not rely on over 300 or 400 tons a month from the State; it imports scrap from South America, from Europe, and even from British India. Laid down here, scrap iron is worth 3½ cents a pound, say \$15 a ton.

Captain Sutter's Nuggets.

General W. T. Sherman has been prominently identified with matters affecting the world's history, independent of his brilliant military career in this civil war. He drew up the first official report to the Government of the United States of the discovery of gold in California. Gold was discovered in the spring of 1848, about 60 miles above the present city of Sacramento. General Mason was at that time in command of the United States forces in California, and acted as Military Governor, with headquarters at Monterey, the capital of the Territory. General Sherman, then a young lieutenant of the Third Artillery, was the adjutant of General Mason's staff. Yerba Buena, now the great city of San Francisco, was but a hide-trading port of 400 native inhabitants. As soon as gold was discovered, Captain Sutter went down to Monterey with a quantity of samples of the precious metal for the inspection of the military authorities.

General Sherman, in conversation with some friends a few evenings since, referred to this important historical event substantially as follows:

"Captain Sutter brought into General Mason's office several small packages of samples and spread them out before us. The specimens presented varied in size from fish scales and split peas up to the size of beans. General Mason asked if I knew how to test whether this stuff was gold or not. I said certainly, and immediately tried my teeth on a lump and made an indentation, which impressed me that it was malleable. I then sent for a hammer and an anvil and pounded several pieces out flat. This was a crude but practical test; but we then applied acids, which verified the fact that the samples were genuine gold. I was at once sent up to the diggings and made a thorough examination of the gold discoveries which were rapidly being found in new localities and in wonderful amounts. I returned to Monterey with a quantity of specimen samples and drew up the official report to the Government, which was signed by General Mason. This report, accompanied with a quantity of samples of gold, was forwarded by a special bearer of dispatches, who was no other than Henry D. Cooke, recently the first Governor of this District of Columbia. He was sent off in a small sailing vessel with instructions to intercept a British steamer on the southern coast and make rapid transit to Washington, regardless of expense. We had not then been advised of the ratification of the treaty with Mexico ceding California to the United States, and were necessarily very anxious that the Government should possess information of the discovery of gold at this earliest moment."

Thus, less than 40 years ago, "Old Tecumseh's" teeth made the first official impress, put the first Government stamp of value on the gold delved from the mines of this modern land of Ophir. And it is a fair presumption that more than half of the 60,000,000 inhabitants of this republic, who are enjoying its wonderful prosperity, resulting largely from the discovery of gold in California, have been born since General Sherman indented the first gold specimen with his teeth. —Washington Critic.

PREHISTORIC REMAINS IN LASSEN COUNTY.—Mr. D. L. Moulton, of Madeline Plains, gives us the following concerning the finding of the remains of fishes, etc., while digging a well at his place. Mr. Moulton's ranch is situated on the southeast side of Madeline Plains. This fall, while sinking a well, and when at a depth of 14 feet, he struck a soft sand rock, which was taken out in layers of four to ten inches in thickness. Between these layers he found a number of skeletons of fishes, sea-shells, leaves and sticks; many of the leaves and sticks being in a petrified condition. The prints of the form of the fishes were distinctly marked between the layers of rock, and all the bones were in a good state of preservation. One fish measured two feet in length, and from the connection of the backbone he was led to believe it had been a cod-fish or haddock, but in all probability was a species now extinct. These bones were taken out and it was his intention to preserve them, but on being exposed to the air all except the back-bones were crumbled in to dust. He found many of these fishes which ranged from four inches to two feet in length. They were firmly imbedded in the sand rock with the imprint, but upon being brought to the surface and exposed to the air, it soon slacked to such an extent as to completely obliterate all traces. He says it is his intention to sink in another place and see what he can find. There is no doubt but that at some time, perhaps centuries back, the entire Madeline Plains were a sheet of water, which gradually receded, leaving the fish on dry land. —Susanville Advocate.

A BLASTING EXPERIMENT.—A rare experiment in Cornish mining has been tried this week at West Basset mine. Unhappily, however, it resulted in the manager breaking his arm. It had been decided to blast some ground in the desire to bring down, at one time, from 15,000 to 20,000 tons of stuff. Such an attempt had, perhaps, never before been made in connection with Cornish mining. The cost would be about £50 less than 1d per ton. Were manual labor used in the customary way, years would have been taken in breaking the stuff alone, at a cost of 2s 6d per ton. The instantaneous fuse of Messrs. Bickford, Smith &

Co. was used, and upon the dynamite charge exploding this stuff came away. The filling up of the vacuum caused a rush of air to pass with terrific force through the level in which the agents and men were standing. All were driven before the rush of air, and several were thrown, including Captain Nicholas, whose arm was broken. He was otherwise injured. The limb has been set, and it will be some time before the manager returns to his work. —London Mining Journal.

Handling Cages in Shafts.

We take the following from the Virginia (Nav.) Enterprise of last week:

"I notice the following item in a recent number of the San Francisco MINING AND SCIENTIFIC PRESS:

"John Hambleton, a miner, while descending on the cage at the St. Lawrence mine, Butte, Montana, was fatally injured. It appears that after dinner Hambleton gave the signal to be lowered down the shaft on the cage, and when about 100 feet from the bottom the cage began to rapidly descend, with poor Hambleton on it. He was found shortly afterward at the bottom, in an insensible condition. The brakeman, who had control of the brake at the time of the accident, says that the brake, for some unaccountable reason, would not hold. Mr. Hambleton died after being brought to the surface. The coroner's jury attached no blame to the brakeman."

"Now, what I wish to remark, and my language is plain, is simply this: There is bound to come a day when such a jury will attach blame to all companies permitting a cage to be lowered faster than a given speed."

Our communicant, says the Enterprise, is a practical miner, and knows just what he is talking about. He is also a very ingenious mechanic and inventor of a device for preventing a mining cage from falling in case of the breakage of the cable and non-working of the ordinary safeties, through the broken cable keeping up too much tension, etc.

But there is one point which he does not seem to recognize or appreciate, which is this: The ordinary regular rate of speed of cages in mining shafts—the C. and C., for instance—is 40 feet a second with rock or other material, and half that rate—20 feet a second—with men. A less rate of speed would not be advantageous or profitable, especially in deep mining. In hoisting, should the cable break, and the usual safety clutches be in good order, the descent of the cage would probably be immediately arrested. Yet it might not, and, in descending at the regulation speed of 20 feet a second, any device which would stop the cage would simply tear it to pieces, and be equal to striking bottom.

A suggestion comes in right here which costs nothing. Instead of the present style of safety clutch, which is expected to stop a falling cage within seven or eight inches, have clamps 10 feet in length—as long as the cage—so arranged as to firmly grip the guides and stop the cage in 20 or 40 feet. This would be more gradual, and perhaps more effectual. Anyhow the idea costs nothing and is merely thrown out as food for reflection.

South Australian Gold Diggings.

The Sydney Herald of November 25th gives the following summary from the gold-fields:

In mining circles there is little of particular interest to report. This excitement in connection with the Kimberly rush has long since abated, and the return of disappointed diggers is reported almost daily. What promises to be a valuable gold area has recently been discovered at Teetulpun, South Australia, where numbers of heavy nuggets have been unearthed. A rush has set in, but overcrowding the fields is very strongly deprecated. The Fairfield, near Tenterfield, continues to attract attention and about 700 persons are already on the spot; the ground having been pegged out in all directions. Up to the present time the Prospectors' claim has not yet made its first washing up, but it is reported that an inspection of this plate revealed the presence of a very large quantity of fine gold. At King's Plains, Carcoo, several nuggets have been found averaging from one ounce downward. About 50 men are on the ground.

Christie Palmerston, who has arrived at Geraldton, reports having, in company with G. E. Clarke and W. Joss, discovered a gold field 35 miles west of Geraldton and 40 miles from Perth. The prospects average 15 pennyweights to 1 ounce of fine gold to the load of wash, accompanied with a little fine tin. The wash dirt is from 1 foot to 20 inches, and the sinking 3 to 5 feet. The lead has been traced for miles, but its continuity is broken by creeks. Palmerston brought in from 30 to 40 ounces of gold. The road is very bad, being all jungle. There is no mode of transit for diggers' requirements, and the rainy season is about setting in.

A letter to the Sydney Herald from the Kimberly fields of Sept. 22d, says: "Another murderous outrage has been perpetrated by the blacks. A few nights ago, while five men were asleep in their tent, which was pitched near the Panton river, some 60 miles north of McPhee's creek, the blacks threw a shower of spears at them. One of them was speared in the side and another in the neck. The latter died almost immediately and without a groan, but the injuries of the other man are not of a serious character. The blankets protected the remainder of the party, and they escaped without a scratch. By the time the three who were not injured became awake there was not the slightest sign of a black in the neighborhood."

Santa Clara County Oil Wells.

The attempt of the Standard Oil Company to control the sale and production of oil throughout the world, has been followed by the shutting down of many mills in California, because the owners of which felt unable to enter a competition that would reduce the price of oil to less than the cost of refining. The oil company in Santa Clara county has been compelled to submit to the dictation of the Standard monopoly, but a rebellion has lately been inaugurated which appears likely to succeed. Referring to the promising oil territory in this county and the opportunities for development, etc., "J. D. M.," in a late number of the Los Gatos Mail, says: Oil is found in nearly all formations newer than the plutonic or eruptive rocks, the necessary conditions for its production being a fossiliferous stratum overlaid by a tight covering, reaching to a depth of 10,000 to 20,000 feet, where the interior heat of the earth is sufficient to effect destructive distillation, a process that is carried on in every

Manufacture of Illuminating Gas.

The tight covering is the essential part of the arrangement, as otherwise, though an abundance of oil and gas might be distilled at great depths in the earth, they would be diffused through the overlying loose earth and pass off imperceptibly. As all the products of such distillation, or at least such as reach the surface of the earth, are lighter than water, it is evident that they would follow the under side of such a covering to the surface. Hence the necessity of boring deep holes until the well known fine sandstone is tapped, when oil is sure to appear. The oil formation or fossiliferous deposit, in a former geological age extended from San Diego to Puget sound, and from the ocean on the west to the Sierra Nevada mountains, and was an ocean deposit, probably 10,000 or 12,000 feet thick. The folding of the strata, a process that can be imitated on a small scale by crowding the leaves of a book edgewise, thrust the coast ranges of mountains upward through this mass, the oil strata gradually being stripped off; first by the waves of the ocean and then by the annual rains, the wash going to fill up the lower places such as the Santa Clara, Gilroy, Sacramento and San Joaquin valleys. Generally, a lower series of rocks were gradually lifted up such as now form the summits or crests of nearly all the Coast Range, the exceptions being the mountains now covered with the redwoods, the soft shaly rock, with the moist climate, being especially adapted to a tree forest. The oil formation

Disappeared Long Ago

From the mountains that contain quartz, limestones, paving stone, serpentine, etc., these last being known as metamorphic or changed rocks, from the fact that the fossils have disappeared, the material thereof being now crystallized limestone. The oil formation, sometimes of great thickness, is seen dipping under the valleys on all sides of the Coast Range. Some traces of it may be found lapping on the lower flanks of the Sierras, but as they are much older than the Coast Range the oil formation is often obscured by the wash from the older mountains. It is the deposits along the coast ranges that interest us as the likely fields for exploration. The oil measure generally is a clayey shale of a dirty white color, verging on a bluish cast, and sometimes quite dark, or nearly black. Whenever it assumes a hard, flinty character the chances of finding oil are considerably increased, for the reason stated at the beginning of this article, as without it the oil, if any, would pass off. Careful search will almost always show oil or gas coming out of the upturned edges of these strata. The presence of the smallest quantity, either as a fluid or gas, is conclusive, and is a good basis for farther search. Such indications are found in this county all the way from Sargent's Station, on the Pajaro river, to Mayfield. Small quantities of oil or gas are perceptible in numerous places around Los Gatos. The water of nearly every well sunk on the junction of the two formations (oil measure and metamorphic rocks) is affected more or less by it.

The Proper Place for Boring

Is not on the upturned edge of the formation, but perhaps miles away where there is no sign of oil except in the character of the rock. A practical geologist to make a careful examination is necessary. A hole bored on the edge of the formation would sink into the barren metamorphic rocks. Such a hole was sunk by the citizens of Gilroy, 2000 feet deep, at an expense of \$15,000. Ill-advised search is sure to result in a failure, causing a bad reputation for really valuable oil territory. There are promising points near Gilroy, San Jose, Mayfield and San Lorenzo, and all along the San Joaquin valley on the eastern slope of the Coast Range, especially on the line of the railroad through the Livermore valley. Well-directed search is sure to result in final success, though many failures will of course occur, as in all underground explorations. The accidental discovery of gas near Stockton is likely to produce a thorough test of that part of the country. A similar discovery here would have the same result. But why should the people of San Jose wait for the accident, when a little well-directed search would determine the matter, and place them in the lead in the oil industry? The cost of a few trials, divided among the citizens at large, would be but a trifle.

SAN FRANCISCO:

Saturday Morning, Jan. 8, 1887

TABLE OF CONTENTS.

EDITORIALS.—Academy of Sciences; Mining Wheel; Average Yield of Quartz, 17. Passing Events; Mining Mistakes Common in the Past; Blankets for Saving Gold; Rainfall and Mining, 20. Pacific Rivers and Harbors; Silver-Plated Amalgamating Plates; Saving Fine and Flour Gold; Foundry Notes, 21.

ILLUSTRATIONS.—Lefley's Mining Wheel Attached to Smelting Furnace, 17. Arrangement of Plates in Gold Quartz Mill; Sluice for Saving Fine and Flour Gold, 21.

CORRESPONDENCE.—Roasting and Leaching of Silver Ores, 18.

MECHANICAL PROGRESS.—Improvements in Steam and Locomotive Engines; Danger of Water in Steam Pipes; Something New in Bell Manufacture; The Age of Steel; Alloys; America's Fourteen Inventions; Spinning Attachment to Sewing Machines; Rest in Steel, 22.

SCIENTIFIC PROGRESS.—Combustion of Powder in Cannon Firing; Microbes a Necessity; Experiments in the Use of Coal; Siltywater a New Explosive; Successful Descent on the Amazon River; A Fireproof Tree, 22.

ENGINEERING NOTES.—American Mechanical Engineering; Oil as Coal; Electrical Railways, 23.

USEFUL INFORMATION.—Brushing Up—Using Means to an End; A Return; Wire Guns; Ball-Pointed Pens; Composition for Picture Mouldings; To Make Faded Writing Legible; To Repair Vulcanite Watch Chains; Window Gardening; Finger Nails; Water Proofing for Wagon Covers, 23.

GOOD HEALTH.—Petroleum as a Medicine; Typhoid Fever; Where to Dig the Well; Yellow Fever and Mosquitoes; The Length of a Step, 23.

MISCELLANEOUS.—Increase of Manufacturing Industries, 18. South African Gold; Captain Sutter's Nuggets; Handling Cages in Shafts; South Australian Gold Diggins; Santa Clara County Oil Works, 19.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 24-25.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 28.

Business Announcements.

Clayton Compressor Works—Brooklyn, N. Y.
Ore-Roasting Oven—J. Applearth, East Oakland.
Books—H. C. Baird & Co., Philadelphia, Pa.

Passing Events.

California still continues the leading gold-producer of the United States, the yield last year having been \$12,579,350, while the next State in order of production is Colorado, with \$3,500,000. California total production of gold and silver was \$14,690,335. We shall give these and other figures further consideration in our annual review on the 22d inst.

The weather continues fine in these latitudes, the days being warm and skies clear. Some uneasiness is being felt on the subject of a "dry year," but this is not as disastrous to the State as formerly, when more dependence was placed on wheat-growing.

Work will soon be commenced on the new Government cruiser by the Union Iron Works, which is quite an event in the mechanical history of the Pacific Coast.

The new gold placers in New Mexico are attracting considerable attention, and a number of miners from neighboring regions are going to the new camp. We shall soon learn the truth of the rumors concerning it.

THE Klamath river is now being located for mining, all the way from the mouth of Humboldt creek to Cottonwood, which will cause a great increase next season in the business of river mining. Only two or three claims have been worked in this section of that rich-paying stream.

Mining Mistakes Common in the Past.

As gold mining, after having fallen to a comparatively low estate, is once more coming to the front in California, some remarks on the mistakes that have heretofore tended to retard the progress of the business, and even bring it into disrepute, might at this time serve a good purpose. First in this category is the disposition so generally shown by mine-owners, experts and others interested in promoting the sale of mines to overestimate the value of such properties. Every mine is, of course, worth whatever it will bring on a fair statement of all the known facts in regard to it. But when these facts are concealed, distorted or misrepresented, as has been too often the case, the friends of fair and honorable dealing have a right to complain of such practice, and even protest against it, as being not only detrimental to the mining interest but in violation of those principles of common honesty which in every other branch of business are expected to govern.

If a merchant sell a cargo of wheat and even a few sacks fail to come up to the sample by which the sale is effected, he may be made to answer in damages. If the vender of a horse or cow misrepresents the good or conceals the bad qualities of the animal, the buyer may obtain redress in a suit at law, and it is difficult to see why a different rule should obtain in mining matters. There is, in fact, no reason why this should be so, nor is it to be expected that investors in mines will continue to tamely submit, as in times past, to the impositions practiced upon them.

Another crying evil in connection with mining transactions is the exorbitant commissions that promoters and middlemen have seen fit to exact for their services, and which have generally ranged from 40 to 60 per cent of the price mine-owners have realized for their properties, this tax coming oftener, however, out of the purchaser than the vender. Here, again, the reason for submitting to these extravagant charges in mining more than other affairs is not clearly apparent.

Another mistake often committed in the formation of mining companies is the over-capitalization of their properties, a practice greatly to be deprecated as being neither honest nor expedient. Such inflation of values is lacking in honesty because it tends to mislead the more inexperienced and ignorant portion of the investing public, and impolitic because the better informed of this class will not be likely to buy the shares of a company whose property has been so over-capitalized that there is little likelihood of their ever being able to pay any considerable dividend on their stock. A mining company starting out with a nominal capital so out of all proportion to the value of their property is apt to create the impression that it has been gotten up for the purpose of selling shares rather than making a large and profitable production of bullion. Such course is calculated to excite distrust rather than create confidence in the scheme, and where pursued may even bring a fairly good property into discredit.

The owners of some of the most valuable mines in the country have shown a commendable modesty in this respect. The Calumet and Hecla Company, which has disbursed nearly \$23,000,000 of net earnings to its shareholders, has a capital of but \$2,500,000, divided into 100,000 shares, of the par value of \$25 each, but now selling at the rate of \$229 per share. The Richmond Consolidated Silver Mining Company of Nevada, incorporated with 54,000 shares, of the par value of \$25 each, making a capital stock of \$1,350,000, has to date disbursed in dividends nearly four and a half million dollars. The capital stock of the Idaho Gold Mining Company at Grass Valley, California, consists of 3100 shares, of the par value of \$100 each. This mine has netted the owners over \$4,000,000. The Sierra Buttes, Plymouth Consolidated and numerous other California gold mines might be cited as additional examples of large merit, coupled with comparatively small amounts of capital stock. The Bonanza companies on the Comstock lode, who, when their mines were making a large production, greatly increased the number and value of their shares, have, with their late shrinkage of production, found it expedient to restore their capital stock to its original status, which will probably not again be disturbed, even though the mines themselves become as

prosperous as they were when the above change was made. As the business of mining has come to largely conform to the more rigid rules that govern in commercial transactions, so should those having its conduct in charge be careful to avoid everything having the semblance of extravagance or speculation. Hence the propriety of mining companies reasonably restricting the number and nominal value of the shares constituting their capital stock.

Some remarks on the mistakes most common in the development, equipment and the practical management of mining properties, are reserved for another writing on this branch of the subject.

Blankets for Saving Gold.

The blanket system may be said to have been introduced into the mills at Grass Valley in 1853. The head blanket troughs were then made in lengths of about six feet, and the fall from one trough to another was from a height of about six inches. The inclination was at an angle of from three to five degrees with the horizon, and they were movable and so arranged that, by pressing on a small lever, the amalgamator would vary the inclination to suit the flow of water and pulp from the batteries.

The blankets first used were the common had ones with a long nap. They were expensive, as the nap came off very easily, and there was a great waste in cutting them to fit the troughs. When the Woolen mills were established in San Francisco, blankets were ordered in long lengths and the width of the trough. They were made of a very coarse wool with the nap thrown up on one side, and altogether a better article than is now furnished to the different mills. So says Mr. Melville Attwood, who first used these blankets at Grass Valley.

Neither the French mill nor Gold Hill mill amalgamated in the battery, nor used copper plates. The pulp passed into a small trough in front of the battery sieves and then passed over the blankets. Every 20 or 30 minutes the blankets were changed and rinsed out, that their surfaces might remain rough and hairy and not become clogged by the fine quartz, and so fail to afford a lodgment for the particles of metal.

Wherever the blankets were changed, the pulp in the troughs in front of the battery was removed and thrown with that washed from the blankets. The washings from the blankets were then ground and washed in troughs and howls to take out all the gold.

At Wiggams' mill, Nevada City, they amalgamated in the batteries in the early days of milling there, say 1855 and 1856. In the Empire mill, Grass Valley, they had pans of mercury in front of the battery sieves, and the pulp passed over the mercury before going to the blankets. In the French mill, the pulp first settled in a box in front of the battery and then passed over blankets. At the Mt. Hope mill, the blanketed trough was divided into two lengths, and between them a pan of mercury was placed, so that a portion of the gold was caught there and was in contact with mercury before passing over second blankets. The rule generally was, however, not to permit mercury to touch the gold before it passed the blankets. This was because, in coating the particles of gold, the mercury renders them globular, destroying their natural angles, thus rendering them less likely to be caught. In some mills the quartz was received from the blankets by a Stetson amalgamator, which is a chest of shallow drawers, each of which is perforated with half-inch holes, arranged so that those in one drawer are over the centers between the holes in the one below. Around these holes are small grooves, which are filled with mercury to catch the gold—the tailings passing off through the holes.

They did very good milling in the early days at Grass Valley when the blanket system was the main dependence, as the figures given in another column, under the head of "Average Yield of Gold Quartz," prove. At some mills the blanket washings were run over the blankets a second time.

THE Locomotive mine, of Arizona, was called for the first time on the stock board on Tuesday, and had quite a lively call. Nearly 5000 shares were sold from \$1.25 up to \$1.50.

Rainfall and Mining.

A Limited Rainfall no Great Hindrance to California Mining.

The rainfall in California for the present wet season has thus far been somewhat less than usual. The precipitation in December came up to about the average for that month. During the preceding autumn it was, however, considerably less than the average. January, to date, has brought us scarcely any rain, present indications still pointing to continued dry weather. While there is yet time enough for sufficient rain to answer every purpose, it cannot be denied that the farmers in some parts of the State have cause for uneasiness.

With most of our miners, however, it is different. A dry winter has no terrors for them. A water famine cannot, in fact, occur in the gold fields of this State. However slight the precipitation in the great interior valleys and further coastwise may be, it is always abundant on the Sierra Nevada and the other ranges of mountains lying adjacent to the principal mining districts. The snow falls on these mountains to a great depth every winter, and melting in the spring and early summer months, keeps the larger streams, all of which have their sources in these mountains, well replenished until the dry season is far advanced, and, in some instances, till the advent of the fall rains. Such of these streams as head in the main Sierra traverse the principal gold belt of the State at various angles, the most of them running diagonally across it. The minor gold field that occupies the northwestern angle of the State is watered by the Trinity, Smith, Scott, Salmon and the Klamath rivers and their branches. These rivers, with the exception of the Klamath, have their sources in the Coast Range and connecting groups of mountains, the Klamath heading far to the northeast in the great lakes lying on either side of the California and Oregon lines.

The heavy snowfall on these mountains is due to their great altitude, which varies from 5000 to 10,000 feet. But while the mountains are themselves so lofty, the gold fields lying along and adjacent to them are for the most part much lower, their mean altitude being less than 3000 feet. They have, therefore, a mild winter climate—so mild that mining of all kinds can be carried on to advantage the year round. During the dry season the water supply is kept up through the melting of the snow on the mountains above, the temperature never being so low in these foothill regions as to seriously interfere with mining operations, even in the winter.

As there can happen in these, our California gold fields, nothing like a dearth of water, so can there occur here no destructive floods. The rivers flowing in deep gorges have little chance to escape from their channels; nor, should they do so, can much harm ensue, there being along them no farming land or other property exposed to be injured by their overflow. If, during any winter, the precipitation is excessive, the water being stored in the mountain reservoirs insures throughout the next dry season an ample supply for all; if deficient, the roads are apt to be good, favoring ore transportation to the mills, such a low stage of water being at the same time produced early in the summer, as gives the river-hed miner a long working season, thereby insuring from this source such an increased product of gold as goes far toward making up for any deficiency that the drouth may have caused in hydraulic and quartz mining, from all which it will be seen that if at any time we chance to have in our mines too much or too little rain, compensating advantages arise out of either condition, as it may happen to obtain.

Turning now from California and directing our attention for a moment to the countries lying to the north and east of us, and how different the condition of things in the mining regions there. Having a common elevation ranging from 5000 to 6000 feet, even the lowest portions of these countries are now covered with a thick coat of snow. The streams are ice-bound and the ground everywhere frozen to a depth of several inches. The temperature is arctic, the thermometer rarely ever rising above zero, and falling sometimes to 40° below that point. Blizzards tear through the mountain canyons and sweep over the desolate plains with irresistible fury. Railroad trains are snowed under. Teamsters, stage-drivers and travelers freeze to death,

Cattle by the thousands perish from cold and hunger. Only underground mining can be carried on, nor is this always practicable, much of the time it being impossible to get the ore from the mines to the reduction works. Placer mining, in the few localities where this branch of the business is still practiced, has to be suspended from October till April, or later, both the ground and the water being in the interim frozen up. Such is the condition of things that at this moment prevails throughout most of the mining districts in Nevada, Utah, Idaho, Montana and Colorado.

Little wonder the experts and other mine-viewers leave our less favored neighbors and seek in California a more enjoyable as well as otherwise favorable field for the prosecution of their winter labors. Indeed, we do not see how this sort of work can be effectively carried on under circumstances so distressful and discouraging. These gentlemen are quite right in pursuing a course at once so business-like and so conducive to their physical comfort.

The more we revolve in our mind the advantages California seems to offer for the prosecution of gold mining, the more do they grow in our estimation. At each writing these advantages assume larger and larger proportions, accordingly as we have time to more fully consider the subject. That our gold-bearing territory offers the best field extant for the investment of money in mining, we entertain no doubt.

Pacific Rivers and Harbors.

It is exceedingly difficult to get appropriations for rivers and harbors that really need improvement, and comparatively easy to get them for those that do not. The reason for this is that members of Congress will not vote money for places in which they are not interested unless others will vote it for their localities in return. In consequence, much money is spent uselessly, and those places which really need work upon them suffer. The appropriations are always cut down, and the sums spent so little at a time that the work is costly and unsatisfactory. As an example we may cite Oakland harbor, which is to cost about \$2,300,000. They have been at work for 12 years and are not half done, when the whole harbor would have been finished in five years at greatly reduced cost had money been forthcoming promptly. They asked for this harbor this year \$250,000 and get about \$60,000.

The engineers in charge get very much disgusted at the way their work has to drag along on all such improvements. The estimates of the engineers are always cut down largely by the committees. The House Committee this year recommend a grand total of appropriations of \$7,158,250, while the total of estimates submitted was \$30,201,749. Among the appropriations are the following: California: Harbors—Humboldt harbor and bay, \$50,000; Wilmington, \$50,000. Rivers—Sacramento and Feather, \$10,000; San Joaquin river and Stockton and Mormon sloughs, \$10,000. Oregon: Harbors—Coos bay entrance, \$25,000; Yaquina bay, \$50,000. Rivers—Canal at the Cascades, \$100,000; mouth of Columbia river, \$125,000; Lower Willamette and Columbia rivers, \$125,000; Upper Willamette (to complete), \$35,000; Coquille river, at its mouth, \$12,500. Washington Territory: Rivers—Skagit, Stielagnamish, Nootsack, Mohamish and Snowqualmie rivers, \$10,000.

The receipts of coal at this port in 1886 were over 1,000,000 tons, the largest in the history of the State. Despite these heavy arrivals, however, the market has been firm for some time and prices have been slowly but steadily creeping up. If continued dry weather indicates a diminished wheat yield, then fewer ships will be sent here to transport our grain abroad. As most of these ships bring our foreign coal, it will readily be seen that decreased supplies from this quarter will harden the market materially, and be of great benefit to the coast collieries, though of course, the consumer would have to pay more for his coal. It is on this weather condition that the coal men are now figuring, though a good rainfall would alter the situation materially.

SIXTY-ONE inmates of the Stockton Insane Asylum, who belong in Arizona, will be transferred January 10th to the new asylum built by the Territory near Phoenix.

Silver-Plated Amalgamating Plates.

Of late years the silver-plated amalgamating plates have largely superseded the old style of copper plates for saving gold in quartz mines. They possess many advantages over plain copper, the principal one of which is that the amalgam clings to them better and the amount of gold saved is increased. No verdigris forms, so that there is a saving in labor also. They are cleaned by means of an ordinary rubber scraper. They retain a larger quantity of quicksilver on the surface than was possible with the plain copper.

In conversation with Mr. E. G. Denniston, of

order—plain, corrugated or rifled, and of any size, shape, or thickness of copper. The silver is put on by weight, the amount being determined by the price. The largest plates of this kind ever made have been turned out by the San Francisco Plating Works, which is outfitted very completely for this class of work, which is made a specialty. At the last 15 Mechanics' Institute Fairs the first premium medal for these plates has been awarded Mr. Denniston.

Saving Fine and Flour Gold.

There is always more or less discussion on the subject of saving fine and flour gold and

ARRANGEMENT OF PLATES IN GOLD QUARTZ MILLS.

the San Francisco Plating Works, who has been making these plates for the past 18 years, and has filled upward of 3000 orders, we gained some facts concerning them that will be of interest. The copper used runs from No. 16 gauge up to one-fourth inch. No. 16 weighs about three pounds to the square foot. The 3-16 weighs nine pounds to the square foot.

the gold from black sands of the ocean beach. Mr. C. Beckmyer, of Blossburg, Montana, sends us a drawing and description of an apparatus which he states will save all the fine and flour gold that passes through, at a very small expense. A drawing of this machine is shown on this page, the view being a plan—looking down upon it. Mr. Beckmyer says: "All that is

SLUICE FOR SAVING FINE AND FLOUR GOLD.

The battery and apron plates are generally silvered heavier than the sluice-plates. The position of these respective plates is shown in the accompanying cut, which represents a mill provided with such plates.

The plating runs from half an ounce of silver up to three ounces per square foot of copper. Prices vary from \$1.50 up to \$6 a square foot, exclusive of cost of copper. For an ordinary 10-stamp mill an outfit of these plates would cost from \$250 to \$300, according to character of plating and weight of copper. Mr. Denniston states that he is sending these plates to all the mining States and Territories, as well as to Mexico, Central America, South America, etc., and people who first bought them years ago still renew their orders, which speaks well for their utility and excellence. The plates are made to

needed is a string of sluice-hoxes. Take the next to the last sluice-hox and cut a hole in the bottom 18 inches square, according to width of box, etc. Place a perforated sheet of iron in same, but to be on a level with bottom of sluice-hoxes. Underneath this sheet-iron a dividing board is placed. Then, leading from under this sheet-iron, is a box running out on each side (No. 4), and from this box No. 4 are three side boxes or grizzlies in which the hurlap is placed (Nos. 1, 2 and 3). These side boxes are placed at water level. The dirt is ground-sluiced, or it can be hydraulicked into the main sluice-hoxes. The coarse matter goes over the perforated iron out through the sluices, while the fine matter goes through the perforated iron into the side-hoxes or grizzlies over the hurlap (Nos. 1, 2 and 3). The side hoxes being only at

a gradual or water-level grade, the fine gold is caught by the burlaps and held. When the burlaps are well covered with flour or fine gold, they are then taken out and washed in a tub of water and the burlaps replaced. After the tub is half full, quicksilver and cyanide of potassium are put into it and the contents well stirred at intervals for 24 hours. Then the material is run over plates and the amalgam taken off with hard-rubber scrapers in the usual way.

"In the sketch, Nos. 1, 2 and 3 are side hoxes or grizzlies, six feet in length and 18 inches wide. The sides of the hoxes are six inches high. In the bottom of each of these side boxes burlap is placed, and tightened on each side with a narrow strip of wood, these strips being held by buttons. No. 4 are hoxes leading from under No. 5, which is a perforated sheet of iron 18 inches square. The bottom of the sluice is out out 18 inches square, and the iron fitted into it tight. The side hoxes are placed at about water level." Mr. Beckmyer says he scarcely thinks this device patentable, but that it is the cheapest way to save flour gold, being especially adapted for ocean beach sands.

Foundry Notes.

Business at the foundries has been more encouraging of late than for some time past, most of them reporting some increase of orders. The renewed interest in mining affairs both here and in Nevada is expected to result in more orders for mining machinery, which were not very plentiful during the past year. It is pleasant to note, however, that marine work is becoming of more importance here now than ever before. The Union Iron Works are building a new steel steamer for the coast trade, and the Fulton have the contract for the machinery of the new ferry-boat of the South Pacific Coast Railroad Company.

Not only are city foundries expectant of more orders this year, but small foundry and machine shops are springing up in many of our interior towns. In Southern California of late, several small plants have been arranged. At Sacramento the railroad shops are very busy, and the force of men employed is the largest that has been there for a number of years. The prospects are that the full force that is now employed, with some increase, will have steady employment all winter, and this means good times for this community. The preliminary work for the construction of the proposed new engines will begin just as soon as the other work can be disposed of. Another immense general machine shop has been planned, but Master Mechanic Stevens states that the date for beginning its construction has not yet been determined on. It will be in the near future however. The shop will be 240 feet in depth and 90 feet in width.

The contract for the building of the Government cruiser Charleston has been signed by the Union Iron Works Company and the papers forwarded to the Secretary of the Navy. The keel of the new cruiser will be laid in a few days. The price is \$1,017,500, and the bonds furnished by the company amount to \$254,375. The iron company of Irondale, Puget Sound, have sold all the iron which they had on hand to the Union Iron Works. The building of this big cruiser will be a good thing for Puget Sound, as San Francisco will draw upon that locality for supplies of iron, coal and lumber.

The large iron dome for the Lick Observatory at Mt. Hamilton is being temporarily erected at the Union Iron Works. The dome is 50 feet high and 75 feet in diameter, weighing 122 tons. It will be completed in March, when it will be tested before being shipped to its destination. It is being put up "loose," since it will have to be taken down for shipment.

MINING IN CHILI.—Recent South American advices state that the celebrated Manta de Ossa mine, in Chanarcello, continues in bonanza and is yielding largely. The famous Veterana mine, Chili, is again in bonanza, and is putting out considerable quantities of high-class ore. It is estimated that the Esmeralda mineral district, Chili, has yielded from the date of its discovery, about three years ago, upward of \$3,000,000 worth of silver ore.

THE golden Lapanto mine, of Hawthorne district, looms up with a new and important strike which is reported to be of great value.

MECHANICAL PROGRESS.

Improvements in Steamer and Locomotive Engines.

Both double and triple expansion engines are rapidly coming into use for steamers everywhere. The double-cylinder engine has done so well that in Europe triple-expansion cylinders are just now being very generally ordered for new steamers. In regard to the popularity of this latest improvement we have seen it stated that no contract has been let to build an ordinary compound engine for the English navy since January, 1885; none for the French navy since May of that year, and none for any navy within the past year. The English have now about 30 triple-expansion engines under contract for their navy, the French 10 or 12, and the Russians and other powers quite a number—in fact, all the latest-designed vessels in Europe.

Four-Cylinder Locomotives.

There is also a revolution impending in the construction of locomotives, and that improvement is due to the success which has everywhere attended the triple-expansion engine on ocean steamers. Not," says the *New York Sun*, "that compound engines are to be used for locomotives, but if a number of cylinders aggregating the same power will save coal on an ocean steamer, why not on a locomotive? The fact that the present system is not the best has been well known for a long time. The transmission of power through the connecting rods of the two drivers is an uneconomical way at best, and when in going around curves the wheels are not able to turn in unison, one or the other must slip so long as they are rigidly connected.

"Now it is proposed to use four cylinders instead of two, one pair for each set of drivers. The aggregate power of the four is equal to that of the two now used, but it was found in a series of experiments made at Woolwich Arsenal in England by the British War Office that the power used to move the locomotive itself was from 30 to 40 per cent less with the four cylinders than with the two. The experiments were made with an old two-cylinder locomotive altered to use four cylinders. Of course, the results were not equal to those that could be obtained with a machine made to order. The coming locomotive will have a pair of cylinders for each driver-wheel axle."

Danger of Water in Steam Pipes.

Many are not aware of the danger that ensues when condensed water is permitted to accumulate in steam pipes and no means provided for drawing off, by suitable opening provided with cocks arranged or located at the lowest points in a line of pipe.

The danger arises from the fact that when the steam encounters a body of cold water, there is rapid condensation, causing a vacuum, and the violent rush with which the water is then driven along the pipe like a water hammer, against elbows or the casing of a valve, sufficient sometimes to drive a hole through the solid metal, as if it had been punched with a solid ram of steel. Connecting pipes between the boilers of a battery, a part of them having been cold for a few days, have been ruptured by opening the valves that closed the connection with the boilers under pressure of neglecting to properly drain the pipes. Men in charge of boilers have been seriously injured by neglecting these precautions. Not only valves have been ruptured, but steam pipes are sometimes split, in some cases for several feet of their length.

It has been proved beyond question that no steam fitter who neglects to provide for the easy and rapid removal of all water of condensation is fitted or competent to be trusted with the supervision of work requiring the intelligence and caution which has been shown to be necessary in laying lines of pipe for carrying steam.

There is no doubt that a reliable automatic steam trap which will drain the water off from the line will prevent these disasters; and it is the duty of persons in charge of the erection of steam lines to see that ample means are provided for preventing the accumulation of water. Every low part or place in the line should be provided with traps or drain cocks, ample to carry off in a few minutes any water in that part of the line.

It is often found that through false notions of economy the cocks placed for draining off the water are too small, and it often happens that the man who is charged with the duty is hurried, and the work is only half done. The best economy is to arrange so that a line of pipe can be quickly and easily drained, and, by this, the possibility of disaster is removed.—*Master Steam Fitter*.

SOMETHING NEW IN BELL MANUFACTURE.—A new method of making bells has been invented by an Englishman. The bell is not cast, but made of metal bent or spun to shape. It may be made in several pieces and hard-soldered together. The peculiarity of the bells so made is that they give an astonishing volume of sound. One which weighs but three and a half pounds gives, it is said, as much sound as a cast bell of ten times the weight, and the tone is very pure and true. The inventor guarantees to produce a bell weighing one ton that shall be as musical and efficient as an ordinary

bell of 20 tons. If this can be done it will be a great advantage as regards church bells, requiring much less outlay both for the bell itself and for the structure in which it is hung, to say nothing of the lessened cost of transportation.

The Age of Steel.

The present has been called "the age of iron," but it might be more appropriately termed the age of steel. The processes of manufacturing steel have been so improved and cheapened of late that this material is rapidly taking the place of iron in many industrial applications, and the substitution will probably be more extended in the future. Steel rails for railways are now produced almost as cheaply as iron ones; indeed, a great Belgian house recently offered steel and iron rails at the very same price. Steel manufactured by the Bessemer and Siemens-Martin processes may be expected ere long to be used instead of wrought iron for almost every purpose. One of the latest uses proposed for steel is in the making of tin-plate. The Bessemer method of producing steel, which had its origin in England some 25 years ago, still continues to be followed more largely in that country than any other. No industry in modern or ancient times has sprung so suddenly into importance, nor has any other caused greater changes in the way of setting aside an old and introducing a new order of things. To this change is due the fact that numerous iron furnaces have been closed up and thousands of workmen thrown out of employment and compelled to seek new fields of labor. The age of iron is fast coming to an end and the age of steel has nearly, if not quite, overshadowed it. As a consequence, our industries must recognize the new era and adapt themselves to the changed demands. The revolution may be attended with temporary inconvenience—with loss to both workmen and employers—but in the end it will prove of advantage to all. Such things are among the necessities of this age of progress and improvement.

ALLOYS.—The art of combining metals to acquire the peculiar or best qualities of each is of very ancient date, coins having been found bearing a date 335 years before Christ, which contained some tin in their composition, and from that day to this, experiments have constantly been made to acquire the finest results by amalgamating different metals. There is still room for improvement in some direction in all of the alloys thus far produced, even the delta (copper, zinc and iron), the lead-bronze (lead and antimony), German silver and sterrometal (copper, zinc and iron), phosphorized bronze, etc., having failed to give complete satisfaction in some respects. An alloy recently patented by a Frankfurt man is said to surpass all others in its exceptional durability and resistance to all acids. A cylinder made of the new Reitz alloy was left to lie for six weeks in concentrated muriatic acid, at the end of which time it had only lost 5.02 per cent, while the least amount lost by other alloys during the same test was 12.42 per cent. Other experiments with the new bronze were equally successful. The price is no higher than other alloys, but the process is patented at home and abroad.

AMERICA'S FOURTEEN INVENTIONS.—Some time since an English journal frankly gave credit to American genius for at least 14 inventions and discoveries which, it says, have been adopted all over the world. These triumphs of American genius are thus enumerated: First, the cotton gin; second, the planing machine; third, the grass mower and grain reaper; fourth, the rotary printing press; fifth, navigation by steam; sixth, hot air or caloric engine; seventh, the sewing machine; eighth, the india-rubber industry; ninth, the machine for manufacture of horseshoes; tenth, the sand blast for carving; eleventh, the gauge lathe; twelfth, the grain elevator; thirteenth, artificial ice manufacture on a large scale; fourteenth, the composing machine for printers. And yet the inventions of the magnetic telegraph, the telephone and the ironclad war ship are not included—the three which, perhaps more than any of the others mentioned, except possibly the cotton gin, have done more than any others to revolutionize the world, its industries, its commercial relations, and its methods of war.

SPINNING ATTACHMENT TO SEWING MACHINES.—The *Scientific American*, some two or three years since, had a cut and description of a spinning device to be attached to sewing machines, intended to take the place of the spinning wheel generally used with hand machines for spinning. The attachment, which is the invention of a Nova Scotian, is fastened to the legs of the machine immediately beneath the table, and is driven by a hand from the driving wheel. It also suggested that if some genius should invent a loom attachment, to do the weaving, and a cotton-field attachment, to raise the raw material, the machine will be complete. We have not heard of either of these devices being introduced into practical work as yet.

REST IN STEEL.—The physical condition of steel is known to be unsettled for many hours after being rolled. Finally it comes to a state of rest, but any test of its quality before that period arrives is misleading.

SCIENTIFIC PROGRESS.

Combustion of Powder in Cannon-Firing.

Some very interesting experiments have recently been made, by photography, showing the imperfect combustion of powder in the discharge of cannon. The experiments were made by Light Battery K, U.S. Artillery, stationed at the Presidio in this city during its last summer march to Monterey. The photographer was Lieut. H. E. Harris, army instructor in photography. Instantaneous views were taken at the moment of discharge, showing distinctly the smoke from the vent and the mouth of the cannon, while at some distance from the smoke a bundle of radiating lines are seen for the distance of about eight times the length of the gun, gradually separating as they move forward. It is held that these lines are unburnt grains of powder, and that it is this unburnt powder which causes the erosions or grooves on the inner walls of the gun, which, as they increase in number and depth, work a very material damage to the gun.

These photographs have been carefully engraved by the *Scientific American*, and accompany a letter-press account of the experiments in that paper. The guns employed were 7-inch muzzle-loaders, and the photographs appear to show that a very large proportion of the powder was thus expelled—much larger than has generally been supposed. These guns had been subjected to a discharge of only 600 rounds, and yet they were seriously injured in the manner alluded to. The heavier the gun the larger is the charge employed, and of course the greater the amount of damage sustained.

Experiments of this kind have heretofore been made by firing at screens and noticing the effect on them which must have been produced by the unburnt powder. But the photograph is much more decisive and satisfactory, and makes a most graphic exhibition of the phenomena. The idea of such a method of their study is worthy of a California observer and affords another wonderful illustration of the progress of the art of photography in this State, and of the favorable conditions of our atmosphere for such work.

A correspondent of the subsequent issue of the paper alluded to suggests that the lines shown may not be altogether due to unburnt powder, as pieces of ignited and semi-carbonized asbestos cloth or other materials employed to wrap the charge might produce a large portion of the lines shown.

Microbes a Necessity.

The editor of the *Medical Press and Circular* takes quite a utilitarian view of the presence of microbes in animal and vegetable economy. Speaking in a somewhat facetious way, he writes as follows:

A great deal of ill-feeling has been excited among these unfortunate animalcules, whose size should have insured them protection against contumely and insult. There is scarcely a disease, scarcely a mishap, but what they are inveighed against and condemned without a hearing, and very often, indeed, without being even called upon to put in an appearance. As an independent journal we feel it our duty to protest against wholesale and often unfounded denunciations by individuals not unfrequently formulated more with a view to self-aggrandizement and notoriety than from any positive ill-will toward these humble little beasts. We will not deny that a few of them have gone astray. When they engage in the elaboration of the virus of typhoid, smallpox and measles, to say nothing of hydrophobia, and a variety of other uncomfortable visitations for mankind, it is only natural that we should retaliate by calling them opprobrious names in dog Latin, and by poisoning them wholesale when and where we can bring our animosity to bear upon them. They have manifestly violated the statutes in such cases made and provided. But on the other hand, he will assert, with the courage and independence that is our wont, that if there were no microbes there would be no mankind, and our disputes would be silenced in death.

Our very digestion depends upon them to a great extent, and if they were withdrawn from circulation we should very shortly become painfully aware of the fact.

They are accused of contaminating our water, but it is equally certain that were it not for their ceaseless activity all the water in the world would be a concentrated solution of excrementitious and noxious products, the disintegration of which is due to these little organisms.

The importance of microbes to the growth of plants has been practically demonstrated by M. Laurent, who obtained only one-fourth as much huckwheat from sterilized mold as in soil containing bacteria.

As an American contemporary points out, there are about a thousand species busily engaged in the destruction of wood, and, were it not for their intervention, all the trees that ever grew would be standing to-day, living, or it may be dead, but in any case as solid, as sound and as firm as when they ceased to grow, and all life must have been choked out ages since. Fire alone would have relieved mother earth of the incubus thus weighing upon her, but only with the result of leaving every patch

of land a parched and ash-covered area, inadequate—at any rate, for some time—to the maintenance of life, even if we ourselves had not at the same time been prematurely scorched off the face of the earth.

No, let there be no class distinctions; every community has its black sheep, and these should very properly be branded with the mark of infamy. The existence, however, of these misconducted atoms will not justify our extending the anathemas to the countless millions of their species in whom and with whom we live, and move and have our being.

EXPERIMENTS IN THE COMBUSTION OF COAL.—Experiments and calculations relating to the heat of combustion of coal are continued with unabated interest, and contributions of more or less value to the existing knowledge of the subject are constantly being made. The investigations of Scheurer-Kestner, and the devices of Fischer, Schwackhofer, Thompson and others have been of great service in pointing to errors in figures and methods commonly accepted as substantially correct, and yet later experience has shown the necessity of further careful work in the same field, and the possibility of grave errors in calculations based on data now available. The objections which have been urged against several of the calorimeters proposed and used within the past few years are that they are too complicated, and that the corrections to be applied are too many and too important. Unfortunately, there is much truth in this. The work of investigators seems in many instances to have been devoted more to the development of different methods of accomplishing the same purpose, each without any special advantage over the other, than to the best possible solution of the problem and the elimination of factors and elements liable to introduce errors into the results. It is to be hoped that this fact will receive due consideration in future experiments. A judicious combination of simplicity and delicacy in the measuring instruments, or, in other words, a minimum of complexity for a maximum of efficiency, is the point to be sought, and upon it rests the attainment of practically valuable and reliable figures.—*Iron Age*.

SILOTVAAR, A NEW EXPLOSIVE.—Mr. Rucktschell, a Russian engineer, has, it is said, invented a new explosive, which he calls "silotvaar," with which experiments have been recently carried out at the camp of Krasnoie Selo, near St. Petersburg. As compared with ordinary gunpowder, the penetrative power of the new explosive, when used for cartridges, is stated to be ten times greater. The compound of which the explosive consists is still the secret of the inventor. The explosive, an exchange says, emits no smoke or heat, and the discharge is unaccompanied by any report. Since these experiments the Russian war and naval authorities have had the new explosive examined and tested by experts, who, it is stated, have pronounced favorably upon it. It is further stated that a motive force may be generated with the explosive by means of an engine constructed by the inventor, for which he claims superiority over steam and gas engines. The inventor has patented both the explosive and the engine in several countries. If patented, the composition cannot be a "secret." On the whole, this reads, the *Mining Journal* thinks, like our own American Keely motor.

SUCCESSFUL DESCENT OF THE AMAZON RIVER. Dr. H. H. Rashby, the eminent photoist, for nearly two years past has been exploring the resources of Peru, Bolivia and Chili, with respect to the supply and cultivation of cocoa leaves. His travels have been made on behalf of a prominent manufacturer of the new alkaloid known as cocaine. After finishing his cocaine researches, the doctor was authorized to return by way of the Amazon river, with a view to obtaining scientific information concerning the flora and other features of the region. From the mountains of Bolivia, he floated in a canoe a distance of some 3500 miles, reaching Para, in Brazil. This must have been a remarkable journey, full of perils and adventures. The scientific results of Dr. Rashby's travels will be awaited with much interest by scientists everywhere.

A SCIENTIST writes to a German publication in regard to nickel-plating zinc, which has hitherto resulted so unsatisfactorily, that it can be successfully and easily accomplished by first dipping the zinc into mercury. A fine plating of the nickel can then be secured on the zinc with even a feeble galvanic current, durable and susceptible to the highest polish. Any metal (German silver, for instance) that will not take a nickel plate easily can be treated in the same way with the best results.

A FIREPROOF TREE.—The *Gardeners' Chronicle* mentions a curious tree, a species of *Rhopala*, of contorted appearance, and growing to a height of about 20 feet, which is said by Mr. W. T. Thistleton Dyer to be absolutely indestructible by fire, and which survives in large districts in South America where the dry pastures and hush are burnt twice a year, and everything in the way of vegetable life is destroyed with the exception of this tree.

SOME fine granite has been found at Temecula canyon, San Diego county. It is considered by those who have examined it the finest deposit yet discovered in the State.

ENGINEERING NOTES.

American Mechanical Engineering.

Quite a compliment was paid to the commercial success of American mechanical engineers by a member of their English compeers at a recent meeting of the Manchester Association of Engineers. The occasion was a discussion on a paper upon "System in Engineering Works," in which the author, Mr. Hans Penold, dwelt at considerable length upon the manner in which the work of mechanical engineering business should be conducted, both in the shop and in the sale of the shop products. The subject was discussed under the different heads of—How to get orders? How they should be taken in hand to get the best and most economical results? And how to make the most of a workman's skill? The speaker made quite full reference to the last few years of depression, and of

German and American Encroachment.

Which had shown that in fabric the commercial department of English engineering works would have to bestir itself to find out where our markets were; if direct, or through what agencies the largest number of customers could be reached; and again, to consult the tastes of our customers more closely than has hitherto been done. In the discussion which followed it was generally admitted by the assembled engineers that in the points sketched,

American Machinists Were Ahead of English Firms;

In short, that their engineers seemed to have more commercial ability than the English had and were able to excel in the selling department. One feature in connection with American manufacture which was not very often found in England was commented upon by one of the assembled machinists to be that, "when a new article was being introduced in America, the question was what price it could be sold at in the market, and the manufacturer then laid himself out to produce it at this price. In England the cost of an article was very often based on what it had cost to produce the first half-dozen." As a commentary upon the foregoing it may be remarked that the United States is the only market in the world of which England is not independent for its supply of machine appliances.

GAS ENGINES FOR LARGE POWER are taking the place of steam engines in some localities in Europe. The works at Deutz, where Otto's gas engines are being built, are now busy with large motors of this class for driving mills and factories, instead of the usual steam engine. These gas engines are used in connection with a special gas-making plant, and it is stated that whereas the average consumption of an ordinary steam engine is 3½ lbs. of coal per horse power, the corresponding consumption of the gas engine is only 2½ lbs., and this economy has induced several works to replace their steam engines by large gas engines. Among these works are the zinc rolling mill of W. Grillo, in Oberhausen, where 10 gas motors supply an aggregate of 244-horse power; the Mechern Berg Werk Verein, where seven motors supply an aggregate of 174-horse power; the Russian company for the manufacture of powder in Schlussemburg, where 17 motors supply an aggregate of 194-horse power; a sugar factory in Elsdorf, where six motors supply an aggregate of 191-horse power; the water-works of the town of Coblenz, with 120-horse power; the municipality of Prague, with 150-horse power (for electric lighting); and the opera in Frankfort-on-the-Main, with two motors, having 100-horse power.

OIL AS COAL.—Notwithstanding the reported failure of oil as a substitute for coal on several of the ferryboats in San Francisco harbor, the official figures, as given in a late issue of this paper, show most unmistakably that oil is not only the cheapest and most economical of the two fuels, but that it also is productive of the least destructive influence on the boilers and furnaces. Why the boats went back to the use of coal is known only to those most directly interested. The public is only left to conjecture as to the reason. And now we have a report of a late meeting of the Northeast Coast of American Engineers and Shipbuilders of a discussion on "The Fitness of Oil in Place of Coal as a Fuel for Steam-raising Purposes," in which Mr. H. F. Swan (Armstrong, Mitchell & Co.) was able to speak of at least a dozen boats his firm had built for the Volga and Caspian, and he said all of these had been eminently successful. Other speakers followed in the same strain. So our California experiments should not be taken as any important factor in deciding this important question.

ELECTRICAL RAILWAYS.—Electricians are greatly pleased over the success of the electrical railway in Minneapolis. The train and load weighs 90 tons, and a speed of seven miles an hour is made, which is all that is allowed. In a short time the system is to be extended to other Western cities. The experiments being made in Europe are highly successful. Practical electricians predict that they will soon overcome every obstacle in the way. The first electrical railway on the Pacific Coast is just about ready to go into operation in Los Angeles.

USEFUL INFORMATION.

BRUSHING UP—USING MEANS TO AN END.

There are many ways of adding to the appearance of farm buildings and making a farm or country dwelling pleasant and attractive. Trees, shrubs, etc., judiciously set out, cost but little in time or money, and may be made both useful and ornamental. Then again the buildings themselves may be greatly improved and preserved by paint or some other application of color. Any intelligent person can add such attractions at a trifling expense. If paint is too costly, there are many kinds of white or colored wash which can be employed to both beautify and preserve the various structures on the farm—fences as well as buildings. All compounds of lime and albumen are more or less insoluble, and some of them answer almost as well as the more expensive oil paints. Milk and blood are both rich in albumen, and when combined with lime are very durable and if properly shaded and applied look almost as well as cheap paint. Color of any desired shade may be imparted by the use of cheap pigments. Get fresh, newly-burned stone lime and slake it with boiling water until it crumbles to fine powder. Then mix with skim milk to the proper consistency, adding one pound of gnod cement to the bucket of mixture. Stir constantly while mixing, and you will have a most excellent whitewash paint, which will hold on for a long time. The addition of a little flour paste will help it. The Germans make a very durable and cheap paint by using lime, as above directed, mixed with bullock's blood; apply it quite thick in consistency. If it appears to be too thick to lay on well, thin down with skim milk. Lime, blood and silicate of soda, mixed, also make a durable covering. Any person by intelligently using simple means may in a great many ways accomplish very important and useful ends.

A RETURN.—One of the novelties in Paris is a big wooden cow built in front of a cafe. The milkmaid milks a stream of milk punch into a glass, and a placard proclaims the astonishing facts: "France has sent Bartoldi's goddess to America, and America gratefully sends in return a milkmaid." Speaking of statues it may be remarked that Japan now reports two statues that would rival our "Liberty" in height, were they standing erect instead of sitting cross-legged as they are. These are both figures of Buddha; the first, near the City of Nara, is in a temple 156 feet high, and the figure which is seated cross-legged measures 53 feet high from the top of the low pedestal to the crown of the head. It is made of plates of bronze 6 to 10 inches thick soldered together. The face is 16 feet long by 9½ feet broad, and the width across the shoulders is 29 feet. The second statue is the Great Buddha at Kamakura, 15 miles from Yokohama. This is seated as the other, and is 49 feet 7 inches high.

WIRE GUNS.—We have already alluded to experiments in the manufacture of wire guns. It is stated that such guns are now being manufactured at Woolwich. The steel wire—which is rectangular in section, and is specially prepared for this purpose—passes through a testing machine before being coiled upon the steel cylinder, which forms the central portion of the gun. The testing machine consists of two sheaves placed upon horizontal spindles some distance apart, and revolved by power; while the wire which takes a few turns round each sheaf, passes over them. The speed of the leading sheaf is slightly greater than that of the other, and thereby a strain is put upon every portion of the wire as it passes through the machine. To prevent accidents in case the wire breaks, it is threaded through a gas pipe between the two sheaves.

BALL-POINTED PENS.—A new pen, known as the "ball-pointed," is being introduced. It is so made that the point of contact with the paper is a curved surface, and not, as in ordinary pens, a fine point, which is liable to stick in the paper or scratch along its surface. By adding this round point the inventor has designed a pen which approximates in ease and freedom of writing to the best quills. It may be held in any position, and neither scratches nor sticks in the paper. Its peculiar form also enables the nib to retain a larger quantity of ink than an ordinary pen, thus avoiding frequent dipping into the ink-well. The curved point has the additional advantage of preventing crossing, while it adds materially to the durability.

COMPOSITION FOR PICTURE MOLDINGS.—Dissolve one pound of glue in one gallon of water. In another vessel boil together two pounds of resin, one gill Venice turpentine, and one pint linseed oil; mix and boil together until water has disappeared, when add finely powdered whiting until mass is of consistency of putty. This is hard when cold and soft when hot. It can be molded in plaster of Paris or glue molds. The white base or groundwork composition is mason's hard finish. It would be advisable to drive brads or tacks where the high parts come to be bedded in the composition, and hold it in place.

TO MAKE FADED WRITING LEGIBLE.—A new discovery is announced whereby the faded ink on old parchments may be so restored as to render the writing perfectly legible. The pro-

cess consists in moistening the paper with water and passing over the lines of writing a brush which has been wet in a solution of sulphide of ammonia. The writing will immediately appear quite dark in color, and this color, in the case of parchment, it will preserve. On paper, however, the color gradually fades again, though it may be restored at pleasure by the application of the sulphide. The explanation of the chemical action of this substance is very simple: The iron which enters into the composition of the ink is transformed by reaction into the black sulphide.

TO REPAIR VULCANITE WATCH CHAINS.—The following is a very good way to repair vulcanite or rubber watch chains: If an attempt is made to open them cold, the links will, in nine cases out of ten, snap, especially stout ones; and if they do not break, the ends spring open and will not again close. Heating by fire or candle will burn them, but if held over the chimney of a kerosene lamp they will in a few seconds become so soft that you might bend them straight and shut them up again or close them as when new without injury to shape or polish. Horn or tortoise shell may be heated in like manner.

WINDOW GARDENING.—It is said that in growing flowering plants in pots, if large flower pots are used, there will be more leaves than flowers. It is often the case, that plants do not bloom at all because, having so much space, their strength is expended in forming roots and leaves. Window gardeners must have often noticed the masses of matted roots that are often found against the walls of the flower pot completely enveloping, with a heavy matting, the ball of earth in which the plant is growing.

FINGER-NAILS.—Somebody has been figuring out the annual growth of the average finger-nail. It appears that the growth is about three inches a year, or 10 feet during a life time of 40 years for a single finger. At this rate, the growth of all the finger and toe-nails of the world for four generations would furnish length of finger-nail enough to scratch the eyes out of the man in the moon.

WATER PROOFING FOR WAGON COVERS.—For a flexible water proofing for wagon covers: Take boiled oil 15 pounds, beeswax 1 pound, ground litharge 13 pounds; mix and apply with a brush to the article previously stretched against a wall or a table, washing and drying each article well before applying the composition.

GOOD HEALTH.

Petroleum as a Medicine.

Dr. Blache states, in the *Bulletin de Therapeutique*, that a refiner of petroleum having been prohibited by a prefect the distribution of petroleum in medicinal doses, the fact led to an inquiry being made as to its alleged utility in affections of the chest. The native petroleum from Pennsylvania and Virginia was that experimented upon first. It is a very safe substance, for even large quantities, when drunk by error; and in such cases has caused only a little nausea. In chronic bronchitis, with abundant expectoration, it rapidly diminishes the amount of the secretion and the paroxysms of coughing, and in simple bronchitis rapid amelioration has been obtained. Its employment in phthisis has been continued for too short a time as yet to allow of any opinion being delivered as to its efficacy, beyond that it diminishes the expectoration, which also loses its purulent character. The petroleum is popularly taken in doses of a teaspoonful before each meal, and after the first day any nausea which it may excite in some persons disappears. M. Gardy, a Paris druggist, has prepared capsules, each containing 25 centigrammes of petroleum, or, as he calls it, *huile de Gabion*, from the name of an ancient petroleum spring, and this Dr. Blache considers as the most favorable mode of administering it.

Kerosene and Diphtheria.

Dr. Wilson, of Meriden, Conn., asserts that the use of kerosene oil was in no slight manner accountable for the seemingly otherwise inexplicable spread of that mysterious malady called diphtheria, which recently caused many deaths in the town where he is practicing. He fortifies his assertion by the presentation of some confessedly startling figure results, from which it appears that the greatest percentages of fatal cases of diphtheria occur in households whose inmates employ kerosene oil to furnish them the necessary artificial illumination; and, further, his figures also show that all those who used either gas or candles, even when attacked by the malady, eventually reached a convalescent state. The Connecticut doctor's affirmations have evoked widespread interest, and the agitation of the topic appears to gather strength with the lapse of time, which, of course, is not to be wondered at, for the matter strikes closely home to the major portion of the people of this country. Mr. J. M. Starr, of Richmond, Ind., says he knows of half a dozen instances in that city where diphtheria had appeared in households within 10 days from the time the inmates commenced the partial use of kerosene oil either as an illuminant or as a feeder for cooking stoves.

All these reports are discredited by the physicians of the New York Health Department. Dr. Janca says that burning kerosene might

cause soreness of the throat in some cases, but he does not believe that it ever caused a genuine case of diphtheria. In New York diphtheria is not confined to houses where kerosene is used, but is equally prevalent in houses where gas alone is burned. Almost any disease will be aggravated by the fumes of badly-trimmed, filthy or smoking kerosene lamps.

Typhoid Fever.

Symptoms by Which the Disease May Be Recognized.

When a person becomes ill, suffering with slight chills, loss of appetite, frequent nose bleeding, irregularity of the bowels, coated tongue, rapid, weak pulse, body temperature rising about one degree daily until 105 degrees Fahrenheit is reached, with fugitive pains, especially in the back and head, with progressive muscular and mental weakness, and an inclination to be stupid, the presumption is very strong that the patient has typhoid fever, and this notion is much strengthened if, with the above symptoms, there be a tumid abdomen, gurgling on pressure on the right side.

These symptoms may exist about 14 days, and gradually abate, and the patient recover, but the patient may, on the other hand, go on from bad to worse, and finally be destroyed by exhaustion, perforation of the bowels, or bowel hemorrhage. If on examination of the body of one dead under the above circumstances there be found numerous patches of inflamed surface in the bowel known as "ileum," it is perfectly proper to ascribe the death to typhoid fever. The poison of the disease, which is probably a microscopic plant, exists mainly in the bowel evacuations of those sick of the disease. It is true that this substance has never been isolated and shown to men so one would show a sample of wheat or other seed, but it exists all the same, and when a person develops the disease it is because he has swallowed some of the poison with his drink, most likely, and it passes along the alimentary canal till it finds a good soil in which to grow—that is, in the position indicated, known as "Peyer's patches," a glandular formation bearing the name of a learned physician long since dead. It is probable that some in vigorous health might take small amounts of this poison into the system and escape unharmed. A temperature of 41.2 degrees—that is the boiling point—kills the poison of all zymotic diseases. Here is the sum of the prevention of the trouble: Maintain a high state of the general health and boil all suspected water before using. In fact it is well to use nothing but boiled water when any epidemic disease prevails. Some typhoid fever patients will recover by rest in bed, and using only liquid food. Others will die in spite of the best of attention. These last are either constitutionally weak or received enormous doses of the poison. Enteric fever is the better name for the trouble in question.—*Medical Journal*.

WHERE TO DIG THE WELL.—Let us remember that a well will drain an area with a diameter equal to twice its depth. Therefore, a well 12 feet deep will drain an area the diameter of which is 24 feet, that is to say, that it will drain the surrounding soil for 12 feet in every direction. Obviously then the privy should be more than the depth of the well away from it, and more than this again if it is proposed to place it on a higher level, which, however, should never be done. The well should be lined inside thoroughly with mortar so that percolation cannot occur between the crevices of the bricks, and it should be well covered, so that surface drainage cannot get into it, for you want to drink water that has come into the well from the bottom, after it has been purified by filtration through the earth. Thus, then, these are the precautions to be observed in locating and building your well in the country. How about the city? Well-water in the city should never be used; the sources of contamination are too numerous and too hidden to be avoided.—*Annals of Hygiene*.

YELLOW FEVER AND MOSQUITOES.—A somewhat curious theory is that of Dr. Carlos Finlay, of Havana, who contends that yellow fever is not transmitted through the air nor by contact, but by inoculation, which is largely performed by mosquitoes. These creatures bite victims of the disease, become infected themselves, and so convey the germs to the blood of other human beings. To support this view, Dr. Finlay mentions that yellow fever was less prevalent in Havana during the unusually hot summer of 1885, when mosquitoes were scarce, than in the late autumn when the insects were numerous. He even goes so far as to conclude that this affection cannot be epidemic where the tropical mosquito does not abound.

THE LENGTH OF A STEP.—Dr. Gilles de la Tourette has recently published a monograph upon normal locomotion and the variations in the gait caused by diseases of the nervous system. He found, from a comparison of a large number of cases, that the average length of a pace is, for men, 25 inches; for women, 20 inches. The step with the right foot is somewhat longer than that with the left. The feet are separated laterally in walking about 4½ inches in men, and about 5 inches in women. The ataxic gait is characterized by an actual shortening of the pace coinciding with an apparent lengthening, and by a considerable increase in the lateral separation of the feet.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PIONEER DISTRICT.—*Ledger*, Jan. 1: In this district a new strike is made occasionally, which helps to give an impetus to prospecting. This district is essentially a "poor man's digging." The veins are small. They nowhere assume the dimensions of a load or fissure. But they are exceedingly rich, far surpassing the average yield of quartz met with along the main belt. Moreover, they are found near the surface. Recently Jake Greisbach made another strike close to the old Pioneer ground. He has taken out a considerable quantity of rock, which appears to be of rich grade quality even for this district of high-grade ores. It is estimated to be worth at least \$60 per ton. He will soon have a crushing made at Mace's mill. This mill has lately crushed 11 tons of rock from Gardner's claim, formerly Len Harmon's mine. It averaged about \$50 per ton.

SARGENT MINE.—This claim at Middle Bar, which was bonded about 12 months ago by W. Petre in the interest of English capitalists, has been abandoned. The shaft was sunk to a depth of nearly 200 feet. Small veins of quartz met with, similar in character to that of the St. Julian adjoining, but the metal was not so rich. They paid \$2000, or 10 per cent of the purchase-money, on bonding the property, and have expended from \$5000 to \$8000 besides. The mine with all the improvements erected by the bonders will doubtless fall back to the former owners.

MISCELLANEOUS.—R. O. McKean and F. Goodman have struck some very good gravel on Sutter creek, six miles above Volcano. They are placing a quantity of pipe in position, and preparing to work it in good shape this winter. The supply of water will be drawn from Mill creek. The old Volcano ditch, which carries water to the Hadley and other claims on Rancheria creek, will not be operated the coming season. The revenue from the sale of water has not been sufficient to pay the operating expenses for several seasons past. The New London is down over 700 feet. They will go at least 800 feet before drifting. The lumber for the additional 40 stamps to the Pacific mill is arriving on the ground, but the work of erection has not yet been commenced. It is reported that the contract for building the mill has been let to a San Francisco firm, and that most of the mechanics will be sent up from the city. The McKenzie Brothers, who have for some months been developing a claim on Ratto's ranch near Clinton, are confident they have a valuable property. By means of a tunnel they have struck a fair-sized quartz ledge at a depth of 170 feet from the surface. The rock is apparently of good quality and prospects handsomely. At another point on the claim the surface croppings indicate a ledge of much larger dimensions. A gentleman is up from the city to inspect the property to report to capitalists who are thinking of purchasing. It is reported that the purchase price of the Wildman mine, Sutter creek, is on deposit in one of the banks of San Francisco, awaiting the arrival of John Tregloan, the agent of the purchasers, who is on his way from the East. The Plymouth Mining Co. will pay, on January 5th, dividend No. 44 of 25 cents a share, or \$25,000, making total amount paid to that date \$1,875,000.

Butte.

PNEUMATIC MINING CO.—*Oroville Register*, Dec. 30: The bed of Feather river with its adjacent bars and banks was among the richest mining sections of California during the flush times in this State. Owing to the trouble with water, very rich beds of gravel were left unworked. These the Pneumatic Mining Company began to work on last summer, and were successful in striking rich pay; so rich that seven dollars to the single panful of dirt was taken out. Owing to the machinery for forcing the air in so as to keep the water back, getting out of repairs, the drifts filled with water. Duplicate engines and boilers were put in which took about one month's time. When the drifts filled, air leaks were caused by the inward flow of water, to remedy which, time will be required to solidify the ground. This may take two months, and in the meantime it is proposed to sink a new tube on another part of the claim. No change will be made in the location of the machinery. Work will probably be recommenced about the first of next week. The expenditures of the company cannot have been less than \$30,000 in developing this mine. The gravel is very rich and it is safe to predict vast sums of gold will be taken out when the company gets fairly to work.

Calaveras.

THE STICKLE MINE.—*Mountain Echo*, Dec. 29: The Stickle mine in this town, under the superintendency of Mr. W. A. Nevells, is being worked with a vim that betokens business and prosperity. Stopping is being carried on vigorously in the north end on the 400-foot level, where considerable work was required in the way of filling up the stopes in order to reach the ore body with the Burleigh drills. This work has just been completed, and the drills are playing sad havoc with the large body of ore before them. The ledge on the 400-foot level is between 25 and 27 feet in width and of a medium grade. Work is being carried on as briskly on the 200 and 300-foot levels, where stopping north and south is being prosecuted with considerable activity. Everything in the mine is in first-class condition; the chutes, which are always well filled with ore, are so arranged as to admit of car-filling with considerable ease. There is now enough ore in sight to keep the mill in operation for three years. Mr. D. P. Pierce, the assistant superintendent, informs us that he has managed to employ 30 men to good advantage and accomplish the same amount of work formerly done by 40 men, and that the expense for running the mine has been greatly reduced under the present management. As near as we could learn, it can be safely estimated that \$6000 per month will be the average yield from the ore that is now being mined. The plates are cleaned daily, instead, as formerly, at the end of a month or six weeks' run. Mr. Pierce claims that a large amount of gold is saved by this way, which by the old method passed over the plates unobserved.

MURPHY'S.—*Calaveras Citizen*, Dec. 26: Notwithstanding the tardiness of the water in visiting us and moving the wheels of industry in mining and farming, we are moving on prosperously and everything looks well for the future. Mining in all its branches never looked better, and reports coming in from all quarters guarantee the best results. The want of water is a great drawback for placer mining and mills, but beneficial for sinking to greater depths. The Oro Plata is running night and day, up to its full capacity. Stamps and pulverizers are in motion, reducing nearly 100 tons of ore per day. When the compressor is started up, more men will be given employment, and greater activity will be noticeable. The management is able and directed in an intelligent manner. From the Esmeralda mine on Indian creek the news is very encouraging, and this section bids fair to rival in extent and richness any section in the county. A feeder for the new mill, now nearly completed, is of a new pattern, and noted for its completeness.

A GRAVEL MILL.—*Calaveras Chronicle*, Jan. 1: A gravel mill is in course of construction on the old "Concentrator" claim at the head of Jackass gulch, near the hospital of the French Mutual Relief Society of this place. The claim has lain idle for several years, but during the past few months the old tunnel has been reopened and the work of prospecting has been pushed ahead energetically. Various drifts have been run to explore the ground and find its quality and extent, and we are glad to say that the result of these explorations has justified the company which has gone into the enterprise to erect a gravel mill and open the mine in proper shape to work it. During the past week or 10 days a number of teams have been engaged in hauling lumber from the mountains for the construction of the mill and necessary buildings. The heaviest of the lumber, such as mortar blocks and frame timbers, are already on the ground, and the mill building put up so that work can be prosecuted in sunshine or in rain without interruption. The work is going on as fast as skilled workmen and able-bodied men can perform it. The weather up to the present time has been very favorable to permit the heavy hauling to be done. It will not be long before the mill will be up and ready to crush gravel, of which developments have proven the existence of an abundance bearing gold sufficient at least to make it a good dividend-paying mining property, if not a bonanza. The mine is under the management of C. M. Burleson, Esq., of Rocklin, Placer county.

El Dorado.

VANDALIA.—*Cor. El Dorado Republican*, Dec. 30: Yesterday I paid a visit to the Vandalia mine. I found the superintendent, Mr. Kelly, at the mill. They were cleaning up, and the plates were well charged with amalgam. The mine is paying well. They have a No. 1 5-stamp mill, run by steam power, with everything new and improved machinery. The property is very valuable and a sure success. The price paid for this mine to Marks was \$20,000. In a short time they will have all their money back. The Big Canyon gold mine, formerly known as the Oro Fino, has one of the best mills of the size in the State. Twenty stamps will start up today. They have the latest improved machinery—the best that can be obtained. The mill runs by water.

Fresno.

HILDRETH MINES.—*Fresno Expositor*, Dec. 29: The stages from Fresno and Madera continue to arrive tri-weekly with their full complement of passengers, and all look as though they were bent on doing something to make a winning on some "lay-out." This speaks well for the increasing population of Hildreth, and it certainly will be an important mining district in the near future. Of the late discoveries of importance in ledge matter none compare with that owned by Barney and Harry Clark, and popularly known as Ireland's Pride. Their property is unusually favorably situated, being within a few hundred feet of the San Joaquin river, where they can utilize the great water power of that stream. Their shaft is down 60 feet on a ledge of ore that mills \$30 per ton. At present they are drifting on the ledge from the ravine, being in 40 feet. They have 20 tons of ore on the dump, but will not start milling until the dump has been increased to 300 tons. Francis & James have been offered \$16,000 for one-half of their claim. No definite idea can be given of the extent of the ore body, for what they consider waste and which is thrown over the dump will mill \$10 to \$12 per ton. Their richest rock will go into the hundreds, while the second and third-class grades will mill from \$40 to \$80 per ton. The sulphurets are very good. The latest find has been recorded by H. Towers and James Curby, lying east of the Hanover mine. McNally is working the Stockton mine. When once started with a full force this property will excel the Abby mine. The Dahlonega mine, owned by O. M. Gaddis, Geo. W. Grayson and Mr. Nicholson, is the south extension of the Lily mine, which was sold lately for \$25,000. The Dahlonega mine is a fine property, having a strong and well-defined ledge of good milling quartz that prospects \$35 per ton; value of sulphurets unknown.

Inyo.

SAMPLING WORKS.—*Register*, Dec. 30: The mining business bordering on this valley along its length of more than a hundred miles is essentially of a chloriding nature. There are perhaps a hundred different mines from which ores are being extracted in varying quantities and kinds, and sent out of the country for reduction. A reliable sampling establishment at some central point on the railroad would do a paying business for itself, and at the same time promote the mining industry wonderfully—with a good concentrating plant, it would be just the thing.

ORE SHIPMENTS.—Many carloads of ore have recently been shipped to the new works at Reno in addition to what we may call the regular shipments from Lookout, Darwin, and Cerro Gordo. Heretofore the most of the ore shipped has been silver-lead, but about ten cars of the recent shipments are gold ores, with different lots of high-grade silver ores, some of the latter assaying as high as \$1500 per ton and over. These lots are from different mines and from both sides of the Inyo range.

MARBLE QUARRY.—*Inyo Independent*, Jan. 1: The new mill at the marble quarry was started up last week. Everything worked well, except that the speed was too great, and a stop had to be made to gear down a little. Mr. Luce says of the quarry: "The quarry improves with every step, and is devel-

oping splendid, just as I saw by the eye of faith, based upon past experience, for had it not improved it would have belied all the past, both ancient and modern."

Nevada.

LONE TREE MINE.—*Tidings*, Dec. 24: The Lone Tree Mine, below Forest Springs, and owned by a company of gentlemen in Gilroy, is now looking first-rate. There are four feet between the walls in the drift and most of it is solid ledge. The ledge has been large for some time, but Mr. Cohoe, the efficient and experienced superintendent, has never deemed it advisable to crush the rock, as he thought it did not carry a sufficient amount of gold. The last two or three days the ore has much improved, and shows gold quite freely, besides the rock being of general good quality. It is almost certain that there is a good-paying mine there, and the company intend to find it.

San Bernardino.

TO START UP.—*Calico Print*: The five-stamp mill of the Bahten Bros. at Providence is about to start up. Its motive power has a capacity for ten stamps and it is expected before long that five more stamps will be added. The Perseverance mine from which the ore is taken adjoins the Bonanza King, and has as good a showing as the latter when it was opened up. The Bahten Bros. have bonded the mine to an English lord, and on the 25th inst. he is expected to take charge of the property.

Shasta.

THREE MILLS.—*Shasta County Democrat*, Dec. 29: The mining interests of Old Diggins are looking up. Three good mills are now running in the camp. Andy Fife's mill on the river opposite the mouth of Spring creek was completed last week and is now ready for custom work. The mill was started up on ore from the old Spanish mine in Old Diggins. Senator Foster, of Tehama county, and John Q. Finch, of Anderson, both of whom are largely interested in mining property in Bully Chooch district, were in town last Sunday, looking for teamsters to haul machinery from Anderson to the mines. The senator is putting up a 10-stamp quartz mill in the place of a Hill crusher which he has been using as a prospecting mill. The machinery for the new mill arrived at Anderson. He has great faith in the Bully Chooch mines, and thinks it will be one of the liveliest mining camps in the State next summer. Mr. Ellis, of Round Mountain, who was in town last Sunday, informed us that it is the general report in his neighborhood that the Afterthought and Donkey mines at Furnaceville were recently purchased by a Nevada mining company owning reduction works at Elko. He could not vouch for the truth of the report, but in that connection stated as a fact that some weeks ago several tons of ore from the Afterthought was shipped to that company and the ore was worked successfully, and it is supposed that this led to the purchase of the mines. The Redding Reduction Works Co. having bought ground for the plant near the gas works, will commence to-day to grade the ground for the machinery which is now on the way, and as soon as finished will be able to work any class of ore or sulphurets in Northern California successfully. Parties having mines developed showing in sight enough ore to pay for a plant that will work the same successfully, can have a plant built upon their mine and pay for the same from the receipts of the mine. This company claims to have ample means to back any contract they may make. The success of the enterprise will greatly enhance Redding's future.

Sierra.

SIERRA BUTTES.—*Mountain Messenger*, Jan. 1: The No. 9 tunnel at the Sierra Buttes mine is in about 7500 feet. Another upraise has been started to connect with the upper level, which is in about 700 feet. The distance between the two upraises is about 1500 feet. T. P. Kelly has the contract for getting logs for the Empire Mining Co. mill, at Gold Valley, next spring. The company owns a sawmill and will need about 350,000 feet of lumber next spring. The company has very rich rock and sulphurets, and there seems no doubt of their making the mine a success. Van Slyke has struck the ledge in the lower tunnel, at the Gold Bluff mine. The rock prospects very well, and the outlook for the mine is very bright. From the point where it is tapped by the new tunnel it is about 700 feet to where the ledge cropped on the mountain above. There is about 250 feet of the ledge unworked, above the present tunnel.

Trinity.

A GOOD STORM.—*Journal*, Jan. 1: Weather the past week has been favorable to the hydraulic mining interest, and the expression, "the best storm of the season," was frequently heard. It has rained most of the time in "the basin," with snow on the higher hills, and miners are now all at work with a fair supply of water. More storm of the same kind is prayed for at an early date in order to insure a good mining season. During the week 3.62 inches of rain has fallen, increasing the total for the season, to the close of the year, to 13.69 inches. To the same time last year, 23.89 inches had fallen.

Tuolumne.

SILVER IN TUOLUMNE COUNTY.—*Union Democrat*, Jan. 1: There has lately been opened a valuable and interesting mine on Turn Back creek, about one mile above the junction of the creek and the main Tuolumne river. The development of the mine consists of a tunnel driven 115 feet on the vein which varies from 2½ to 5 feet, and also of an opening on the outcrop of the vein 75 feet above the tunnel level where the vein, being five feet wide as far as now open, shows strongly and carries the same character of ore as that in the tunnel. The formation is slate on both sides of the vein and the ore is largely impregnated with graphite or plumbago. It is soft and easily mined. The ore was a short time ago submitted to Mr. Louis Blanding, who pronounced it to be silver bearing, and his tests proved this to be true. An average sample of the ore was also sent to Prof. Thomas Price, of San Francisco, for assay, and he gave a return per ton \$12.54 in silver and \$6.20 in gold. Last Tuesday Mr. Blanding visited and inspected the mine and was much pleased by its favorable location for rapid and economical work, and regards it as having exceptionally good natural advantages, and states from his experience in the treatment of ores on the Comstock and elsewhere that the ore can be mined and milled for \$6.00 per ton. This is an important discovery to the mining industry of the county.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Virginia Enterprise*, Dec. 30: 1300 level—Main south lateral drift advanced and timbered 38 feet, making a total distance of 168 feet. Face in good vein material. West crosscut No. 1 from this drift advanced and timbered 35 feet, making a total of 45 feet. This drift has passed through some very good stringers of ore, and the last 12 feet of it is all in good ore, portions of which are of very high grade, giving rich assays. It is 90 feet south of the shaft, and 100 feet north of the Chollar line, 1200, or seventh station level—Main north lateral drift advanced and timbered 36 feet; total length, 88 feet. Main south lateral drift extended and timbered 40 feet; total length, 100 feet. All the drifts above mentioned are in good working condition, and all continue in the same vein formation as at date of last weekly report with the exception of the improvement noted on the 1300 level. At the main vertical shaft 1000 feet of 20-inch air pipe has been put in.

SAVAGE.—500 level—South drift advanced and timbered 35 feet south of crosscut No. 1, and continues in the same quality of ore as is shown in the west crosscut. 600 level—The excavating for the working station on the west side of the shaft is progressing well. Another west crosscut, No. 6, on this level, has been started at a point 375 feet south of the north boundary line, which is extended 40 feet in favorable vein material. The sinking of the winze in the ore body, below that level, has been temporarily discontinued. 800 level—West crosscut No. 1 has been advanced 34 feet, making its length 54 feet. West crosscut No. 2, 55 feet south of No. 1, has been extended 34 feet; its total length now being 50 feet. Both of these crosscuts are in quartz which gives low assays. West crosscut No. 3 is 76 feet south of No. 2, and is in 30 feet. 1640 level—Main north drift advanced in the quartz ledge a distance of 25 feet, and the main south drift, 16 feet. The hoisting or galloways frame over the shaft will be completed next week.

CON. CALIFORNIA AND VIRGINIA.—Work in the mine, by the gas from the smoldering fire in the timbers of the old bonanza workings, was interfered with to a considerable extent, but the difficulty has been perfectly overcome by solid, substantial and effective bulkheading, so that now everything is all right once more, and the usual output of ore resumed. A full force of miners were put on at the 1400, 1500 and 1600 levels Wednesday night. In fact, as many men as possible have been put to work in order to make up for lost time in the ore production. The ore cubes were all full, and 100 carloads were shipped off on Thursday, with a similar export yesterday to the Eureka and Morgan mills, on the Carson river. The assays from the mill battery samples for the week average about \$49 per ton. A heavy shipment of bullion will probably be made Sunday evening to San Francisco.

POTOSH.—250 level—Main south lateral drift extended 32 feet, showing ore of fine quality and value. The north winze, being sunk below the floor of the Lindsay drift, is down 28 feet, and continues in the same good ore. The upraise above the southeast drift from the Chollar line is up 40 feet, and still in good ore. The company not being able to secure milling facilities at present, the ore has accumulated in the drifts, wherever it could be stored away, while further exploration work could be conducted.

OPHIR.—Considerable work had to be done in the way of bulkheading the connections with the old Con. California and Virginia on account of the smoldering fire and gas. This being completed, work goes ahead as usual in the explorations on the 1065 and 1300 levels, advancing the main south lateral drift on the 1065 and the south lateral drift on the 1300. This last-mentioned drift corresponds with the 1435 level of the Con. California and Virginia mine.

BULLION.—In the reopening and repairing of the old Croesus shaft, 50 feet of progress has been made during the past week, making a total of 177 feet. As the shaft had caved and filled in solid from the surface and had to be virtually sunk and retimbered over again, this can be considered pretty good work. The new surface machinery operates splendidly, and the whole concern is well managed.

QUINN MINE.—Good progress continues to be made in the erection and placing of the new hoisting works and machinery over the old shaft, preparatory to repairing and sinking the same 100 feet further to where rich deposits of ore were known to extend from the old workings before the disastrous explosion which destroyed the surface works five years ago.

YELLOW JACKET.—Daily yield, 150 tons of low-grade ore from the old workings in the various levels, from the 1300 up. The old ore breasts and stopes in this mine are seemingly inexhaustible, and good effective exploration work is all the time being done toward the further development of the mine, above and below.

OCCIDENTAL.—The usual good progress of advancement made in the drift north from the north incline winze, 48 feet below the track floor of the upper tunnel, and about 18 or 20 tons of fair-grade ore were extracted during the week. The upraise above the lower tunnel was advanced 10 feet; total, 38 feet.

BEST AND BELCHER.—600 level—West crosscut advanced 45 feet, making a total of 105 feet. 1500 level—Station work at the shaft completed and the drift northeast from it advanced to a total extent of 147 feet. Material in all these drifts of a favorable nature—vein porphyry, quartz, clay, etc.

BALTIMORE.—The repairing and retimbering of the main shaft is completed from the 225 level up 125 feet, having 100 feet yet to be done extending to the surface. The work is being prosecuted very energetically under Foreman O'Donnel, and the surface machinery is in perfect order, ready to steam up as soon as required.

TOWA.—Tunnels A and B have made good drives during the week. The headers of both tunnels are now in very close rock, which is thought to be the casing of the main ore vein. It is expected that both tunnels will cut through into the vein during the ensuing week.

ANDES.—230 level—Excellent progress continues to be made cleaning out and repairing the main west drift.

KENTUCK.—The daily output continues to be

about 50 tons of ore from the 800 level and the old workings above. There is a whole wilderness of low-grade ore in this mine yet, with a streak or two occasionally of high-grade.

JUSTICE.—350 level.—The recent rich developments of gold ore in the south drift has induced the sinking of a winze to explore it in depth. A station is being chambered out for the purpose.

UTAH.—472 level.—The lateral north drift started from the main west drift was advanced 36 feet; total length 81 feet. Face is a hard vein porphyry formation.

UNION AND MEXICAN.—1300 level.—Operations confined to running the joint north lateral drift and the crosscut east from it. Both in very favorable vein formation.

ALPHA AND EXCHEQUER.—The new hoisting works building over the old Alpha shaft is nearly completed, and the main hoisting engine is being placed in working position to-day.

ALTA.—720 level.—An upraise is being made in good ore above this level in the old Keystone vein. 800 level.—A winze is being sunk to the good ore body, 22 feet wide, which was passed through by the crosscut east from the winze sunk from the 720 level.

CHOLLAR.—The cleaning out or resinking and retimbering of the old shaft continues making excellent progress, having attained yesterday the depth of 360 feet.

GOULD AND CURRY.—425 level.—South lateral drift from main west drift cleaned out and retimbered to the total extent of 429 feet. Material in face, vein porphyry, quartz and clay.

WEST POTOSI.—This is an eligible new mining location, lying to the west of the Potosi mine, and adjoining the bullion on the south.

SIERRA NEVADA.—520 level.—The main south lateral drift was extended 28 feet, making a total of 77 feet in length. Face in vein porphyry and quartz, giving low assays.

SILVER STAR.—The first-class new whim over the shaft for hoisting purposes is about completed, and ore extraction is next on the program.

CROWN POINT AND BELCHER.—Daily yield 380 tons from the 1500, 1600 and 1700 levels, with some contributions from the old workings in the levels above.

EAST BEST AND BELCHER.—Repairing shaft and hoisting works building preparatory to energetic resumption of work.

NORTH GOULD AND CURRY.—Two shifts of men are employed reopening and repairing the shaft.

Bartlett Creek District.

GOOD RETURNS.—*Silver State*, Dec. 29: Frank Raymond has had some samples of rock from the Crescent and Concord, two new mines recently discovered at Bartlett Creek, assayed. The ore from the Crescent assayed \$158.25 in gold and \$36.10 in silver, and that from the Concord \$13.50, principally gold. He says the Crescent is from three to four feet wide, and the Concord is an immense vein. The Crescent ore ought to pay well, even if only the gold could be saved. Some of these days there will be a boom at Bartlett Creek, and the mines of that district will be worked extensively.

Oberly Creek District.

BRIGHTENING PROSPECTS.—*White Pine News*: From Alex. McDonald, who was in town a few days ago, we learn that the prospects of the old camp are brightening. The Exchequer people are getting ready to start their mill. An important strike has been made in the Ticup by the lessees. But the most promising of all is John Wearne's find in the Wanderer. This mine adjoins the Chance, and is about four miles north of the town. Twenty feet has been sunk on the vein, and a large body of ore uncovered that averages over \$50 to the ton. Four men are at work on it, and it looks as if a big mine will be uncovered there.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Dec. 29: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Dunderberg, 88 tons; White Pine, 6 tons; Flynn, 1 ton; Silver Lick, 21 tons; Hoosac, 5 tons; Williamsburg, 10 tons; Geddes and Bertrand, 6 tons; Bullwhacker, 1½ tons; Marguerite, 4 tons. Eureka Con.—Morey, 7½ tons; Geddes and Bertrand, 1 ton; Fraser and Molino, 1 ton; Phenix, 70 tons; Jackson, 140 tons; General Lee, 3 tons; Diamond, 18½ tons; Grant, 5½ tons; Queen, 10½ tons; Barcelona, 9½ tons.

Kinsley District.

A STRIKE.—*Salt Lake Tribune*, Jan. 1: This old mining district is about 50 miles northeast of Cherry creek. Several Salt Lake business men have struck a rich plum in the Morning Star mine, Kinsley District, Elko county, Nevada. The shaft is down now 85 feet, where has been found from two to four feet of ore yielding 27 per cent lead and 179 ounces silver. The richness of the ore dispenses with concentrating and the ore is hauled 70 miles to Toano on the Central Pacific. A carload arrived in this city yesterday to be put on the market. But the chances are against the ore coming to this city or going to Denver, as the Central Pacific proposes to make it for the interest of all miners along its line to ship ores to the new Reno smelter. The owners of this new bonanza are M. H. Lipman, D. W. Scribner, Wm. McCrae, T. J. Barker, and Coal Agent Colton; the last two holding one-eighth interest each, and the other three one-quarter each.

Mount Rose District.

PARADISE.—*Cor. Silver State*, Dec. 29: The Paradise Mining Company are pushing the work of development ahead with great energy, and their well-directed and judicious efforts will surely be crowned with success in the near future. The Cliff mine is lying idle at present, but rumors say that the owners will soon commence work on it. Mr. John Brannan has been doing the assessment work on the Rattler and some other claims. The Rattler is a splendid property, which has yielded considerable high-grade ore, but it is impossible to do anything without capital.

Patterson District.

MILL.—*Pioche Record*, Dec. 23: W. B. Ayres departed last week, having completed the steam stamp mill for the Patterson Silver Mining Company. The machinery works satisfactorily to the

owners, but the addition of a dryer and roaster will be necessary before any good results can be expected. Mr. L. Holbrook, one of the owners of the above-named company, paid Patterson a flying visit last week and expressed himself pleased with the improved appearance of the mines under development. Mike Riordan and partner are working the Orient mine, and have about 10 tons of 80-ounce ore on the dump. John Krimer and Wm. Warner are sinking on the Hercules mine, in which Hon. W. G. Lyons and Johnny Cupid, of White Pine county, are interested. The bottom of the shaft looks favorable for a body of ore, in character similar to the rich bowlders which they had on the surface.

Reveille District.

PROSPECTS.—*Cor. Belmont Courier*, Jan. 1: Districts near us are also quite prosperous. At Reveille the usual amount of chloriding is being done, and I am informed that the Norris Brothers have leased the Gila mill and mine for quite a length of time and propose to run the same as circumstances may justify. They have now a number of men at work in the mine with good results. They propose to run the mill on such ores as they may extract and buy and upon the tailings awaiting reworking at the mill.

ORE AND BULLION SHIPMENTS.—*Park Record*, Jan. 1: For the week just ended the Crescent made the first winter shipment, since the tramway closed down, of 559,710 pounds of first-class ore. The Daly bullion product from the Marsac mill for the week was nine bars, containing 10,406 fine ounces of silver. The Ontario shipped on the 27th inst. 33 bars of bullion, containing 18,778.5 fine silver ounces. The Mackintosh sampler received during the week 663,690 pounds of Ontario and 259,450 pounds of Daly ore; total, 923,140 pounds.

Tybo District.

THE NYE CO.—*Cor. Belmont Courier*, Jan. 1: First and most important are the operations of the Nye Mining Co., but the developments now being made in other properties here will no doubt add materially to the prosperity of the place. Mr. Trowbridge, as manager of the Nye Mining Co., proposes to erect, as soon as the weather opens in the spring, concentrating machinery for the purpose of collecting the free globular lead from the iron products of the old furnace dump, and also the galena from what are known as the "black jack" ores of the 2G. When this machinery is in operation it will give employment to at least 50 men in the mill and mine, besides those engaged in outside work. The developments in the Dimick mines are showing very favorably for that property. There are now out some 75 to 100 tons of ore. Recent work in some other mines near Tybo has shown fine prospects, and altogether the mining outlook here is cheering.

ARIZONA.

COAL.—*Silver Belt*, Jan. 1: Charles Slack, who has just returned from the Deer creek coal fields, where he has a valuable claim, informs us that he delivered to the Mammoth Mining Company, on the San Pedro, 10,400 pounds of bituminous coal which was tested by the company, and pronounced satisfactory. Mr. Slack expects soon to bring several hundred pounds to Globe to be tested.

COLORADO.

MINING SALES.—*Rosier Silver Nugget*: We continually hear of mining sales all over the State, and predict a change for the better in mining matters in the near future. One hundred and forty sacks of excellent ore were shipped from the Victoria mine last Friday. Mr. Robt. Daniels and Harry Hender-shot in charge, are pushing development on this property and expect to make another shipment in the "sweet pretty soon." News reaches us from the owners of the Ben Eaton mine that this valuable property proposes working all winter and will be ready to make ore shipments in the near future. Yesterday morning they commenced placing necessary machinery on the property to sink the shaft 250 feet from its present depth, and expect to have it in good running order with the coming of the New Year.

AT THE LITTLE MOLLIE.—This property is eligibly situated in one of the richest portions of this section. It was lately bonded to some Denver capitalists for a large sum, who are systematically speeding development. The mine is being operated under the direction of Mr. Pres. Bailey. Six men are employed under foreman Chas. Collins, and considerable ore has been taken out. A shipment of several tons was made this week, and if the returns are satisfactory the management will at once put on a large force of men, and also put in hoisting machinery. The property shows a continuous streak of ore in the shaft. The Saratoga mine, on Brown mountain, is another piece of property that is showing up splendidly as development proceeds. They are working eight men in opening new drifts, sinking winzes, making connections and blocking out the ore, which is a rich carbonate. A large quantity is being taken out and stored for shipment. The mine is bonded and leased, will be worked all winter and will probably be sold in the near future.

HIGH-GRADE ORE.—*Georgetown Courier*, Dec. 23: Two new bodies of high-grade ore were opened in the Astor mines this week. The quality of the ore still holds with increasing size of mineral bodies. Air became so bad some time since in the Bonanza tunnel drift on the Rogers, that work had to be discontinued. An air compressor is now being put in. The heading on the Hood lode has broken into mineral. Past experience leads Mr. W. B. Hood, the owner, to believe that he is on the edge of a pocket of good ore. R. S. Putt and his three partners have struck it rich on Silver Creek. Their claim is supposed to be the east extension of the Two Sisters lode, and is called the Elida. A six-inch vein of high-grade ore was struck a number of days since in the heading of the adit. It would take just \$40,000 to buy them out. A new placer mining company is being formed in Georgetown and Silver Plume to work some good placer near the foot of the range. The country between Georgetown and the top of the range will enjoy unprecedented prosperity the coming season. The newly discovered lodes around Gray's and Irwin's peaks and the new placer diggings will give the west end of the county new life and activity.

GRAPHIC.—The Graphic mine, now in charge of W. E. Koneman, superintendent, and G. S. Chisum, assistant, is employing 45 miners on two shifts.

The boys are shooting out ore from the intersection of the Graphic and Review leads. This mineral is of a much higher lead and silver value than that heretofore encountered in the former property, and the ore body hides fair to improve in volume, though it is now of important magnitude. The Graphic Min. Co. is shipping 60 tons daily on an average. A. Hasty is working a contract in the Review mine, and is dumping fine lead ore. Frank Wilson has completed assessments upon a number of valuable properties in the San Andres districts. One hundred and twenty-eight cars of ore, destined for treatment by the Socorro plants, arrived on one day this week. Reports reach us as we go to press of important gold and silver strikes in the Oscuras, Polvadero and San Felicité districts. More assessments have been performed during the present year in this county than at any time since mining became the main industry of our people.

IDAHO.

CUSTER.—*Idaho Messenger*, Dec. 28: What is generally known as the Morrison Group, on Jordan creek, is said to be looking unusually fine. If this be so, they are wonderfully good now, for on former occasions they have surpassed anything we ever saw. Messrs Morrison & Pierson are shipping their rich ore up to the old Estis astrata on Eight mile, where they are going to work it. The General Custer Mill Co. does not work custom ore now, we understand; perhaps the reason is they have more raised daily out of the Luckyboy mine than their 30-stamp mill can reduce. The manager of this mine, Mr. Wm. Toole, tells us that the Luckyboy is producing 50 tons per day with a force of 40 men; and the ore is of so good a grade that the superintendent of the Custer Co. informs us that he will produce more bullion this month than has been done for any month for five months passed. His help has been somewhat reduced at the mill, of late, and the hands are more tasked than in former days; but we saw no one whose labors appeared more constant and arduous than those of the superintendent.

MONTANA.

A GRAND ENTERPRISE.—*Butte Miner*, Dec. 22: Within the past few days the Wortrich Mining Company, with a capital stock of \$2,000,000, consisting of 100,000 non-assessable shares of \$20 each, was incorporated in Helena to work and develop the mines near Marysville, discovered by W. L. Wortrich, and said to be unusually rich and extensive. The company consists of Henry Klein, president; T. H. Kleinschmidt, secretary, L. Wortrich and others. The mine intended to be worked is an extension of the celebrated Drumlunnon, and is described as "a quartz vein about 30 feet wide, lying in contact with granite and slate formation and carrying gold and silver that will aggregate about \$60 per ton. It is considered a magnificent property, and the success of the enterprise and the good fortune of the Helena parties taking hold of it is beyond doubt. The property is comparatively undeveloped, having but a 50-foot shaft and several hundred feet of tunneling, performed by the discoverer, but the ledge is of unmistakable firmness and continuation." Another new company is the Rapid Transit, gotten up by the same man, Mr. Wortrich, to work the mine that bears the same name and lying west of the Drumlunnon. The company consists of M. Sands, president; G. S. Cross, secretary, Mr. Wortrich and others.

SILVER CHAIN.—*Anaconda Review*, Dec. 24: During the past week the Silver Chain Company has reduced its force to seven men, who are employed principally on repairs and placing the mine in order for extensive improvements which are to be made at an early day. The main shaft has attained a depth of 110 feet. At this depth some very high-grade ore is being extracted. The 40-foot level has been run north 25 feet and south 60 feet, both following a regular vein of high-grade copper-silver ore. The ores extracted from these drifts have been shipped to Butte reduction works, the last carload of which gave returns of a little over 183 ounces per ton silver. The vein in the south drift shows an improvement in quantity and quality. The next carload it is expected will average 250 ounces silver per ton. On Tuesday a crosscut was started east in the north drift, penetrating what appeared to be the footwall. After driving a distance of two feet a vein of ore was cut which was found to be six feet wide, an average sample of which was brought to town and pronounced by competent judges to be 200-ounce ore. A crosscut was started in the south drift where the same vein was found, being in quantity and quality the same as found in the north crosscut. The discovery of this parallel vein is undoubtedly the most important find that has been made in this district since the discovery of the Blue-eyed Nellie, and places the Silver Chain, beyond a question of doubt, a full-fledged bonanza. The length of ground now opened is over 100 feet. The extreme limits of the ore chute have not yet been found, and at a depth of 110 feet not one pound of ore has yet been stowed. It is the intention of the lucky owners at an early day to erect a steam hoist of sufficient capacity to sink to a greater depth; also to place a diamond drill in the mine to be used in explorations.

NEW MEXICO.

VARIOUS MINES AND CAMPS.—*Socorro Bulletin*, Jan. 1: A cleanup of the Homestake mill, White Oaks, recently, was very satisfactory. White Oaks and her mines are attracting considerable attention in St. Louis, and deservedly so. The Homestake, of White Oaks, is just at this time making a remarkably good showing of gold ore. Charley Bell, the cattleman, has recently made several locations on rich copper ore in the North Oscuras. C. T. Brown last week made the discovery of a new body of very rich lead silver ore. The Silver Queen is a promising property. A. A. Franzheim has refused a heavy cash advance for his interest in the Georgia Belle, of Water canyon, which he purchased a month ago. Geo. Deeds came in from the southwestern part of the county last night, with splendid quartz permeated with gold, and left at once for Denver. He made the strike in this county. There is a strong probability that Eaton smelter in the Magdalena is to be converted into a concentrating plant, and greatly enlarged in its capacity. This is

a good move. The Ladrone district is now yielding high-grade silver ore. Jack Donovan came in from Fairview yesterday, and describes the camp as lively and the mining outlook good. He says that more money is made at Hermosa by poor men than in any other camp in the Southwest. The Copper King in the Ladrone district has a 50-foot shaft in which excellent gold and silver mineral decorates the full width, assaying 10 to 15 ozs. in silver, \$30 to \$48 in gold, and 18 per cent copper. The field in which, in a previous issue, we reported the discovery of cinnabar, is now being energetically prospected, and before the week closes this office will have the particulars. In case the mineral is sufficiently abundant the capital has already been raised to erect a plant in this city to convert the sulphide into metallic mercury. Mike Wallace's strike in the Georgia Belle, in Water canyon, has without doubt thrown open to view the largest body of argentiferous galena ever opened up in this county. Work on the property continues without interruption. The mines in the district are commencing to attract attention from capital. The Las Vegas & St. Louis M. and S. Co. has completed its assessments for the year 1886. This company has a number of the most valuable properties in the country, distributed among several districts. It is the oldest mining corporation in the county, and one of the oldest in the Territory. Gustav Billing, of Socorro, has leased the Last Chance mine, owned by Head & Hearst, in the Victorio district, and will soon put on a large force of workmen.

OREGON.

PLACER AND QUARTZ.—*Jacksonville Times*, Dec. 31: Much placer mining is going on in Josephine county at the present time. Legg & McDonald, of Forest creek, have no full supply of water, but have done some work already. A correspondent says that the miners in the vicinity of Woodville have an abundance of water and are busy. Ingram & Baker, of Willow Springs, have enough water to finish cleaning up some ground left over from last season. The Sterling Mining Co. has been operating one pipe for several days past and will soon have enough water to start the other. Owing to the bad condition of the roads no quartz can be hauled to Klippel, Baunle & Co.'s mill, and it is therefore lying idle. J. S. Grigsby and others, who discovered a promising placer mine in the vicinity of Table Rock, are preparing to work it this season. Smith & Lyoch are operating their placer mines in the Wagner creek district and making good progress with a fair supply of water. There has been considerable rain during the week, but not quite enough yet for mining purposes. Some work is being done in many places, however. Hatch & Rieve are still prospecting their ledge in Jackson creek district, from which very promising quartz is being taken. It is reported that the mine is bonded. A. W. Sturgis is having a large quantity of pipe made at K. Kubli's hardware store, which will enable him to make a big showing at his mine on Forest creek this season. Several new hydraulic mines will be operated this season, the old method of ground-sluicing being found too slow for expeditious mining for our short winter season. Dean & Huston have put a long string of new hydraulic pipe and a giant on their mines in Willow Springs district, and will make a more extensive run than ever before. Grod & Brandel are engaged in taking quartz out of their mine on Jackson creek. They were well pleased with the result of the run made on their ore by Klippel, Baunle & Co.'s mill, Simmons, Ennis & Co.'s mammoth placer mine in Waldo district, Josephine county, is being opened at a rapid rate at present and will be ready for scientific mining operations next season.

MINERS HAPPY.—*Oregon Sentinel*, Jan. 1: Rain has been falling off and on during the past week, which has so increased the water as to allow the Ankeoy, Gin Lin and other hydraulic mines to be worked with a full head of water. The large amount of snow on the mountains is believed to be sufficient to insure plenty of water during the mining season. On Tuesday last, Applegate river was so high that it could not be forced.

MINING COMPANY DISSOLVED.—*Oregonian*, Jan. 1: The company consisting of Gen. J. C. Tolman, E. P. Torrey, E. C. McKercher and others, who put up a quartz mill in the Pine creek district, has been dissolved. It appears that the machinery put in would not save the gold, and Mr. Tolman became discouraged and withdrew to his farm in Southern Oregon. The whole concern has now passed into the hands of McKercher. Mr. Torrey feels confident that with the addition of some pans he has procured from Rye valley he can save the gold, and he has leased the mill for six months and will give the work another trial.

UTAH.

REVIEW.—*Salt Lake Tribune*, Dec. 31: The receipts in this city for the week ending December 29th, inclusive, were \$135,530.83, of which \$112,353.07 was bullion and \$23,177.76 was ore. For the previous week the receipts were \$99,180.19, of which \$26,357.53 was ore and \$72,822.66 was bullion. The Ontario product for the week was 20,199 fine ounces, and ore sales amounting to \$8301.97, a total of \$28,500.97 in value. The Ontario closes the year with the usual monthly dividend of 50 cents a share, making \$6 a share for the year, or \$900,000 in aggregate. This is the 127th dividend from the beginning, or a total \$9,525,000 in dividends, and never an assessment. The Daly output for the week was six bars of bullion, 8601.08 fine ounces, and sale of lot No. 77 of ore \$7033.74, a total value of \$15,634.82. Fine bar receipts for the week were to the value of \$37,107.13; base bullion \$15,900. The Stormont sent up on the 23d silver bars to the value of \$2760. The product of the Hanauer smelter for the week was bullion to the value of \$18,260. T. R. Jones & Co. report selected lead received to the value of \$7239.52. Alice bars, 31, amounting to \$21,866.42 were received during the week. Ore receipts for the week include \$10,000 by Wells, Fargo & Co.; \$8700 Queen of the Hills by McCormick & Co.; and \$4477.76 by T. R. Jones & Co.

ORE.—*Park Record*, Dec. 26: Ore shipments were resumed this week and will likely continue on a large scale, while sleighing is good. The Sampson has levied another assessment of 25 cents per share, payable before January 31, 1887. The third Anchor pump is nearly ready for action on the lowest level, and in a few days sinking will be again commenced.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

- 17, 42.—DESIGN—F. M. Gilham, S. F.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HINGE FOR BOXES OR TRUNKS.—J. V. Snyder, Santa Maria, Santa Barbara Co. No. 355,227. Dated Dec. 28, 1886. This is a cheap and easily applied hinge for trunks and such boxes as are used for hutter. The hinge is a rigid piece or strip bent at right angles like a hell-crack lever, and is so arranged as to work readily, and is not easily broken or torn off.

GAS STOVE.—Chas. A. Cushing, S. F. No. 355,143. Dated Dec. 28, 1886. This is a gas stove such as is used for heating purposes. It is provided with water pipes by which water may be heated. The construction is such that cooking may be carried on. The stove is so arranged as to have the very desirable attachment of a water-hack where a sufficient quantity of hot water may be had at all times without in any way interfering with the other processes of cooking.

ARTIFICIAL TEETH.—Chas. E. Blake, Sr., S. F. No. 355,126. Dated Dec. 28, 1886. This invention relates to metal crowns (including the masticating surfaces) with porcelain faces; and it consists in having the thin metal crown perforated upon its labial surface and a thin enamel backed thereon. The crown, which is preferably formed of platinum, is made to fit the root or any remaining portion of the tooth, being built up therefrom, so as to have a proper shape and height, being in all respects when finished a complete tooth ready for service.

ELEVATOR.—Henry Albart, Crescent City, Del Norte Co., Cal. No. 355,114. Dated Dec. 28, 1886. This is one of the class of elevators provided with safety appliances. It consists in the construction and arrangement of the clutch mechanism, the brake mechanism, the safety hatch, and means for locking its sections; the huffers to receive the weight of the cage or car upon the closed hatch; the means for operating the various parts upon the breaking of the hoisting cable or rope, and various other details. The object is to provide effective safety appliances for elevator cages.

ADJUSTABLE INSCRIPTION FOR NAME-PLATES.—D. A. Brown and Josiah W. Roller, S. F. No. 355,132. Dated Dec. 28, 1886. This invention consists in a slotted plate and independent separate and movable chamber and ornament blocks provided with novel shanks or stems, whereby they are fitted to the plate and adjusted and secured in the slot. The object of the invention is to provide for the ready preparation of a plate or sign bearing any name or inscription, and it is designed to take the place of engraving on coffin and casket name-plates, metal signs, etc. This invention is a specially useful one for country and village undertakers and sign-makers.

BARK-CUTTER.—R. C. Kirby, Santa Cruz. No. 355,179. Dated Dec. 28, 1886. This machine is for cutting bark for tanners' use. It comprises, among other parts, a cutter-carrying wheel having a hub fixed upon the driving shaft, a central radial wheel and a broad rim, through which slots are made alternately upon opposite sides, cutters extending longitudinally through these slots, and a feed chute through

which the hark is introduced and brought into contact with the rim and the centers, said chutes having an interior adjustable portion which may be set up so as to regulate the fineness to which the hark is to be cut.

SEWER SYSTEM.—Chas. E. Grunsky, Sacramento. No. 355,163. Dated Dec. 28, 1886.

This improved sewer system consists in pipes or mains graded to the amount of sewage, and sufficiently small to insure velocities that will prevent deposits; self-discharging receivers connected with the closets, basins, sinks, etc., and located at varying heights above the mains, and singly or in groups, the members of which have the same elevation; pipes connecting the receivers with the mains, whereby the contents will enter the mains under considerable pressure; the check valves or gates in the mains whereby water may be introduced and hauled up into any given receiver or group of receivers to cause them to act simultaneously, and thereby to flush the whole system. The object of this invention is to provide a sewer system which shall be effective under all circumstances, and which will permit the pipes or mains to be laid independent of grade.

Mining Share Market.

There is still more or less activity in the mining share market, although prices are by no means up to the figures of a few weeks since. The favorite stocks have been Hale and Norcross and Chollar. The promised dividends of Con. California and Virginia have not come yet. Still the mine had assets on the 1st inst. of \$453,300, and the last week's bullion shipments and cleanup for the month to be added. Potosi and Savage are said to be looking well. The following companies report cash on hand January 1st: Alpha, \$8892; Alta, \$26,646; Andes, \$6294; Benton, \$5544; Bodie, \$13,281; Best and Belcher, \$25,442; Belle Isle, \$1982; Belcher, \$2865; Bullion, \$6277; Bulwer, \$19,267; Con. California and Virginia, \$453,300; Chollar, \$47,420; Crockett, \$5737; Crown Point, \$24,059; Exchequer, \$20,299; Gould and Curry, \$14,280; Head Center, \$1363; Hale and Norcross, \$3563; Independence, \$8977; Martin White, \$6503; Mexican, \$2221; Mono, \$29,000; Manhattan, \$5462; Navajo, \$2417; N. B. Isle, \$256; Occidental, \$4414; Ophir, \$5085; Potosi, \$21,135; Peer, \$7493; Peerless, \$11,686; Sierra Nevada, \$4670; Scorpion, \$9044; Standard, \$15,297; Tranquility, \$8203; Utah, \$5544; Union Con., \$15,769. Con. Cal. and Virginia had \$192,657 cash and \$266,613 bullion on hand and in transit.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bluebird, Dec. 28, \$19,200; Silver Bow, 28, \$29,044; Eureka Con., \$1,104.91; Hanauer, 28, \$38,960; Queen of the Hills, 28, \$420; Bannock, 28, \$1820; Alice, 28, \$12,824; Queen of the Hills, 29, \$2830; Hanauer, 30, \$2150; Bannock, 30, \$3850; Queen of the Hills, 31, \$2200; Hanauer, 31, \$2070; Stormont, Jan. 1, \$3310; Queen of the Hills, 1, \$2300; Hanauer, 1, \$9350; Con. Virginia and California, 1, \$86,404. The banks of Salt Lake City report the receipt for the week ending Dec. 31st, of \$12,353.07 in bullion, and \$23,777.76 in ore; a total of \$36,130.83. The metal shipments out from this city for the week ending Jan. 1st, inclusive, were 19 cars of bullion, 542,610 pounds; nine cars lead ore, 192,429 pounds; 20 cars silver ore, 613,800 pounds; three cars copper ore, 92,900 pounds; total, 51 cars, 1,447,739.

THE CELLULOSE PATENTS.—The Commissioner of Patents has rendered a decision in the important case of the Cellulose Manufacturing Company, of Adams, Mass., which is said to involve millions of dollars. This company obtained letters patent for the manufacture of artificial ivory and had engaged extensively in this work when the Newark Company set up a claim for this invention. This began in February, 1884, and was concluded last week by the decision of Commissioner of Patents Montgomery, who holds that the Newark Company had no right to the invention and directs the rejection of their application.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

BACK FILES OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$6. Inserted in Dewey's patent binder, 60 cents additional per volume.

CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize its poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

A. T. DEWEY, V. E. EWER, GEO. H. STRONG. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enabled us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.
We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATOR WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnaces CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE BEING sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, and weighs OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph) we have satisfied ourselves of the superiority of your Vanner, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Number 3.

James Lick.

At Rest in the Pier of the Great Telescope.

On Oct. 1, 1876, more than a decade ago, James Lick, the philanthropist, died in San Francisco, and was temporarily entombed in the Masonic cemetery. Since that time the various benefactions provided for in his will have been carried forward, and the greatest of them all, the Lick Observatory at Mt. Hamilton near San Jose, is very near completion. According to an arrangement made before Mr. Lick's death, Mt. Hamilton was selected as the permanent resting-place for his remains. This was not by his direction, and it must not be thought that he had any vain idea of securing a lasting monument for himself in his establishment of the Observatory. It was thought fitting by his friends that his tomb should be the solid pier of masonry upon which will rest the magnificent telescope which he has given to the people of this State—the greatest telescope the world has thus far seen. Last week the remains of Mr. Lick were removed from San Francisco to Mt. Hamilton and are now safely inclosed as was planned 10 years ago. The final burial was conducted with simple ceremonies, as will be described.

The remains were taken from San Francisco to San Jose by rail on Saturday, January 8th, with an escort of gentlemen representing the various institutions which have been intrusted with the management of Mr. Lick's benefactions. San Jose was reached at 11 A. M., a procession of citizens of San Jose followed the remains to the borders of the city, and thence to the mountain the body was accompanied by those who went from this city and by the Mayor of San Jose. The mountain-top was reached at about 5 o'clock P. M., and the party proceeded at once to the rotunda, where the casket was opened and the remains identified by Capt. Fraser and others. They then proceeded to the library, where Prof. Davidson read the memorial document of identification as follows:

This is the body of JAMES LICK, who was born in Fredericksburg, Penn., August 25, 1795, and who died in San Francisco, Cal., October 1, 1876.

It has been identified by us and in our presence has been sealed up and deposited in this foundation pier of the great equatorial telescope this ninth day of January, 1887.

In the year 1875 he executed a deed of trust of his entire estate, by which he provided for the comfort and culture of the citizens of California, for the advancement of Handcraft and Redecraft among the youth of San Francisco and of the State; for the development of scientific research and the diffusion of knowledge among men, and for founding in the State of California an astronomical observatory to surpass all others existing in the world at this epoch.

This observatory has been erected by the trustees of his estate, and has been named the Lick Astronomical Department of the University of California, in memory of the founder.

This refracting telescope is the largest which has ever been constructed, and the astronomers who have tested it declare that its performance surpasses that of all other telescopes.

The two disks of glass for the objective were cast by Ch. Feil, of France, and were brought to a true figure by Alvan Clark & Sons, of Massachusetts. Their diameter is 36 inches, and their focal length is 56 feet 2 inches.

Upon the completion of this structure the Regents of the University of California became the trustees of this Astronomical Observatory.

The Board of Trustees of the Lick estate:
RICHARD S. FLOYD, President.
E. B. MASTICK.
CHAS. M. PLUM.
GEORGE SCHONEWALD.

The President of the Board of Regents of the University of California and Governor of the State of California,

WASHINGTON BARTLETT,
(by J. W. Wilkins.)

The President of the University of California and Director of the Observatory.

EDWARD SINGLETON HOLDEN.
The President of the California Academy of Sciences and of the council thereof.

GEORGE DAVIDSON.
The President of the Board of Trustees of the California Academy of Sciences.

GEORGE E. GRAY.
The President of the Society of California Pioneers.

GUSTAVE REIS.
A Director and ex-president of the Society of California Pioneers.

PETER DEAN.
The Mayor of the City of San Jose.

C. W. BREYFOGLE.
The preparation of the above document was assigned to Professor George Davidson. It was approved and then engrossed in hand-

president of the Lick Trustees, Captain R. S. Floyd, in the following words: "Gentlemen: We are here to place the remains of James Lick in their final resting-place beneath this stone foundation of the pier upon which will be mounted the great telescope that he has given to California and the world of science.

"Mr. Lick left no positive instructions as to the disposition of his remains. The idea of making this place a tomb for his body did not enter the motive of his munificent bequest which has created this great work. The idea was suggested to him long after he made his trust deed, and it met with his approval.

about 25 tons and will be about 30 feet high. The mounting of the telescope, the tube and everything connected with it, will weigh 10 tons more.

Sketches from photographs taken at the Observatory are given on this page. It is probably generally known that, upon its completion, the Lick Observatory will become the Lick Astronomical Department of the University of California. The lenses for the great refracting telescope were safely brought across the continent and are now in the safe at Mt. Hamilton; the great iron dome which will house the instrument is approaching completion in this city; the other portions needed for the erection of the telescope are well in hand by different expert manufacturers, and during the coming summer the Observatory will be placed in the hands of the Regents of the University.

Mohave Mines, Arizona.

In the MINING AND SCIENTIFIC PRESS of Nov. 13th we gave an account of a valuable discovery in the Chimahueva range of mountains in Mohave county, Arizona, of a rich ledge containing gold and silver ore. Active work has opened the ledge 1265 feet from the highest point on the vein. Specimens taken from the bottom of the shaft, and assayed by ex-State Mineralogist Henry G. Hanks, gave a result of \$24 in silver and \$190 in gold. This mine has been named the Lion, and we are informed that recent developments show that on each side of the main ledge, about 20 feet therefrom, are parallel veins which assay almost the same amount in gold and silver as the main lode. Such a development is quite unusual in this section. This desolate region has remained undeveloped on account of scarcity of water and the presence of Indians. The promoters of this enterprise have secured an abundance of water close to the ledge, and are making preparations to erect a mill. Mining men and capital have been attracted to this section, and a high offer has been made for the Lion and refused. Active prospecting is being done in this locality, which may verify what has been prophesied, that this univerting range of mountains is full of rich mineral-bearing ledges.

UNIVERSITY STUDENTS AT THE WIRE WORKS.

The senior class in the College of Mechanic Arts of the University, accompanied by Mr. J. A. Sladky, foreman of the University shops, recently visited the California Wire Works in this city and passed several hours in a close examination of the machinery and processes there employed. Regent A. S. Hallidie, of the University, and proprietor of the works, personally explained the various features of the establishment and gave the young men a practical lecture which will be of much advantage to them.

The following is an estimate of the average fineness of *Cœur d'Alene* placer gold in thousands: Prichard creek, 780 to 830; Trail creek, 860 to 881; Old Wash, 950—the finest average of any district in the Territory. Clear creek, near Oro Fino, varies between 869 and 952.

It is claimed that gold has been found on the ranch of Thos. Kell, three miles from San Jose, on the Almaden road. The ranch has been leased and men are at work sinking a shaft on the claim.

THE LICK OBSERVATORY ON MOUNT HAMILTON.

some style with India ink on fine parchment. A notable feature of the document is the use of the words "handcraft" and "redcraft," being the old English terms for technical education. The words are certainly most appropriate, although long since fallen into disuse and not being found in the latest dictionaries.

After the signatures given above were affixed, the document of identification was inclosed between two finely tanned skins, hacked by black silk and soldered in a leaden box 18 inches long and of the same width and one inch in thickness. It was placed upon the iron casket, after which the lining of the oaken casket was soldered up air-tight and the oak lid screwed down. The casket was then draped with an American flag, and it was left in charge of a watchman until the following morning.

On Sunday morning at 11 o'clock the gentlemen who had escorted the body to Mt. Hamilton ascended the gang-plank leading to the foundation-stone, and, arranging themselves around the vault, now containing the casket, with ungoverned heads, were addressed by the

"The trustees have concluded, with the approbation of his son, John H. Lick, now in Pennsylvania, to place his remains in this pier, believing that the most powerful telescope so far made in the world will make his most appropriate monument, and this commanding site overlooking his California home his most fitting resting-place."

At the conclusion of the president's remarks, workmen placed strong iron bars upon the abutments of the vault, upon which was placed heavy iron sheeting. The vault was then built with brick and mortar to the level of the foundation-stone.

A great stone weighing two and one-half tons was then swung, being already suspended for the purpose, and let slowly down upon the brickwork, beneath which was the casket. Three other stones of the same weight were then placed in position, when the four were bolted by suitable bolts, running down to the foundation five feet. On top of the stones will be set the first section of the iron pier of the great telescope. The iron pier itself will weigh

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Remains of Mastodons.

EDITORS PRESS:—Some years since the London Philosophical Society sent a committee of investigation to the Siberian coast, in the Arctic regions, for the purpose of deciding a question then being discussed by scientists concerning the remains of the mastodon found there so plentifully. That commission reported that in their opinion those animals never inhabited that coast, but that the remains now found there were of animals that had been carried from more southern regions by rivers which flow into the Arctic ocean. There is, in a recently published newspaper, an account of a Mr. Mercier, an Alaskan explorer, having found on the surface a glacier 850 miles from the mouth of the Yukon river, the remains of an "Antediluvian forest," six feet in thickness, and associated with it mastodon remains in such abundance that he collected about four tons of them where the glacier was being dissolved at the margin of a stream. He states that some of the tusks were 10 feet in length. Heretofore explorers have frequently given descriptions of mastodon remains and extensive beds of timber found in the Arctic regions, but this is the first instance within my knowledge of such finding on the surface of a glacier. Such an occurrence as this cannot rationally be explained by any generally accepted theory relating to such matters. It proves conclusively, in connection with other facts, that the remains of tropical animals and extensive deposits of timber, now found in the Arctic regions, have been carried there by the waters at the time of a universal deluge. By such an hypothesis, a clear explanation may be given of this and numerous other facts connected with the science of geology inexplicable under any other supposition. The importance of this question will be manifest when it is considered that if the theory here proposed be accepted as the correct one, it will revolutionize the present system of geological chronology, and dissipate entirely the Darwinian theory of evolution which is based upon it. In this connection it is pertinent to remark that it is surprising that a man of so much learning and of such extensive travel as Darwin should form such an erroneous conclusion relating to natural history as he has manifested in his treatise on the earthworm. Confining his particular observation to a small area on one of the British islands, he has assumed that the earthworm has been everywhere a potent factor in the preparation of the earth's surface for cultivation; when the fact is, that the earthworm instead of preceding man and manipulating the virgin soil for his advantage, is his follower—as much a concomitant of civilization as the common house-fly, both of them being scavengers, manifestly designed for that purpose by an all-wise Creator.

JUSTIN CHENOWETH.

S. F., Jan. 1, 1887.

Sulphur Creek District.

EDITORS PRESS:—The mining district known as the Sulphur Creek district, Colusa county, at present is not doing much. The Manzanita mine is working a few men in and about their mill and mine, but shortly expect to put on a full force. The Gibbs Mining Company, a new enterprise commenced by a number of men with a working capital of \$75,000, is prospecting and putting down a shaft about three miles up Sulphur creek and is pushing its prospect ahead most vigorously.

The Clyde mine, which is situated upon the mountain and about five miles from Sulphur creek, has just started up after a three or four months' lay-off, but is only working four or five men. This mine, if properly worked, would pay a dividend every month, but so far has been considerably embarrassed and worked in a very poor manner. But the present lessees, Messrs. Brinn and Cooper, are taking hold and intend to give it as thorough a prospecting as they will be able to in 30 or 40 days' work. But as to workingmen and miners, I would advise them to give it a wide berth, as all they want is the kind of people who will work for their board and a very small salary—about enough to keep them in tobacco and overalls.

MINER.

Colusa Co.

A NEW GOLD FIELD.—A dispatch from Washington says: Consul Figgelmess, writing from Demerara, under the date of December 9th, says there is a great development in gold mining in British Guiana, but no quartz nor gold-bearing ledges have yet been discovered. All the gold collected up to the present time is found in the rivers and creeks by washing. About 3000 people, mostly colored and inexperienced, are in the interior of the colony, prospecting. The climate is very unhealthy, especially so to the whites. The consul mentions two Californians who have been very successful in their operations, but fails to give their names. He says that \$16,000 in gold was exported to England in 1885. Last year the exportations were increased to \$350,000, and he thinks this year's exportations will reach probably \$2,000,000. He says the new industry promises to be a good one.

Spontaneous Combustion in Mines.

Some Scientific Theories as to its Cause.

Alfred Bache, of the English Institution of Civil Engineers, writing on the subject of spontaneous combustion in collieries, says: "Oxidation of the hydrocarbons on exposure to air cannot develop heat enough to ignite the coal;" and the only way in which he can account for spontaneous combustion in such coal is by the presence of dust or fine slack in the midst of any heaps that are found to be heating. Dust and fine slack he considers capable of exerting a condensing power upon the combustible gases that are ready to escape from bituminous or gaseous coal, and also upon the oxygen of the air, and the heat so developed may become sufficient to fire the gas, and thereby the coal. While, therefore, spontaneous combustion may occur in any colliery, whether the coal contains pyrites or not, it is more particularly in seams of coking coal containing pyrites that, as the workings progress, the pillars left standing grow hot rapidly, under the combined action of oxidation of pyrites, pressure and subsidence of roof, and oxidation of hydrocarbons through condensing power of dust. It is the pyrites, however, which, wherever present in any appreciable quantity, play the principal part in starting ignition, and thus constitute the primary cause of fire; the other causes are then but secondary, although they may so far supplement the start thus given as to make a seam containing but little pyrites appear readier to fire than one containing much more. The development of spontaneous combustion is considered firstly in the case of masses of coal, such as pillars left in working. Really solid pillars never fire; those that do are always fissured with numerous cracks and are more or less crushed. Outbreaks of fire are encouraged by the presence of any coal crushed small, which, in its finely subdivided state, promotes the chemical actions that induce heating. First fire smolders at the bottom of the innumerable cracks by which the pillars have become fissured under the crushing load they have to support. Then the walls of the cracks get red hot and burn, sometimes bursting suddenly into flame where the previous heating has covered them with bituminous matter. The tarry smell thus occasioned often betrays the existence of fire before it has become visible; and so difficult is it to find its actual seat that often it is not discovered until it has crept outward toward the air current at the mouth of the chinks, and has ignited the crushed coal behind the timbering of the roads and then the timbering itself. The danger is augmented wherever there are timbered excavations overhead, and still more wherever a timbered drift has been pushed forward under a mass of crushed coal overhead. Through such a mass air circulates easily, heat and moisture collect there, and fire breaks out quicker than where the overhead coal has been got out previously. Wherever crushed coal can be harbored on or among the rubbish that is packed into the goaf, fire is sure, sooner or later, to break out. It begins at some distance in from the roads and creeps out gradually toward them, igniting on the way any timber that may have been left hurried in the gob-packing; the pungent wood smoke gives immediate warning of the fire. Pillars purposely left unworked, either for maintaining a shaft or because the coal in them is not good enough, are also liable to take fire. The load bears unevenly around them, they crush and crack under it. Practical miners were well aware that with slow, sluggish currents in a seam which gave off fire-damp freely it was impossible to keep the general atmosphere of the mine comparatively pure, that is, clear of what is technically termed a "cup on the lamp," or so to ventilate the broken parts of the roof as to keep them clear of explosive gas. With sluggish currents in a fiery mine, its normal condition would be one of such peril that no prudent manager would tolerate; under such a condition of things, any local explosion of fire-damp, which under more favorable circumstances might have been harmless, would by reason of the dust and heat set up, extend itself throughout the colliery.

THE STOCKTON GAS WELL.—Last evening, in company with C. Ewald Grunsky, of the State Engineer's office, a reporter of the *Independent* inspected the gas well now being bored by Jerome Haas for a company of Stockton capitalists. After darkness had set in the gas flow from the well was lighted and it burned without stopping for upward of an hour, until the fire was put out by order of Mr. Haas. The gas supply is not yet as large as the owners of the well want to find, but they are in good spirits over the prospects. They now have enough gas to supply fuel for half a dozen places like the foundry and machine shop owned by Farrington, Hyatt & Co. Mr. Grunsky thinks the queer-tasting water now flowing from the well has many healthful properties. He says the mineral water is as pure and beneficial for debilitated humanity as can be found anywhere. Many people journey to Europe to find water containing the same medicinal virtues as that now running out of the Haas well. Mr. Grunsky is of the opinion that some enterprising manager will drop in the city and at once see great money in establishing a health resort here, and in erecting a fine house for the accommodation of wealthy invalids. Mr. Haas estimated the cost of boring

such a well at about \$5000, but he thought the supply of mineral water was worth a great deal of money, if properly handled. Adolph Hahn, of the Commercial hotel, says he could save a great deal of money with such a well in the rear of his hotel. He thinks the gas supply is more than enough to properly light up a large hotel and furnish fuel for the furnaces. Mr. Haas says he will soon cut through this gas-producing strata and bore deeper for a profitable supply. He feels certain of success if he can reach the proper depth.—*Stockton Ind.*

The State Mining Bureau.

In his message to the Legislature, the retiring Governor of the State, General Stoneman, has this to say of one of our State institutions:

The Mining Bureau was established under the Act approved April 16, 1880. It has, in spite of inadequate appropriations, made such a collection as redounds largely to the credit of the mineralogists in charge, and has afforded an object-lesson of the highest value.

Situated in San Francisco, and therefore easily accessible, it has been visited by thousands, and has been a means of disseminating information of the greatest utility to every county in the State. Many letters of inquiry have come from abroad where its usefulness is cordially acknowledged. Exchange of pamphlets, reports and specimens, have served to advertise the economical possibilities of California, not merely in the precious metals, but also as regards our oils, natural gas, clays, marbles, marls, building material, cements, irons, quicksilver, copper, tin, antimony, etc. Its usefulness can and should be largely extended, and particularly as a means of aiding practical workers, and determining the value or worthlessness of new appliances and processes. The General Government has taken charge of the purely scientific geography and geology of the State, but we need something more—something, namely, that shall be purely practical.

Under Section 2 of the Act, the Bureau is expected to provide and maintain a library of works on mineralogy, geology, and mining; to arrange in cases each minerals as may be collected; to procure and preserve models and drawings of mining machinery and of milling machinery used in the reduction of ores; to correspond with established schools of mining and metallurgy, and obtain and preserve for public inspection and use such information respecting improvements in mining and mining machinery as will be of practical value to the people of this State.

The Bureau is under the charge of successful men of affairs, practical engineers, and a perfectly competent mineralogist—all except the mineralogist serving gratuitously.

The cabinet collection of minerals now in the charge of the State Librarian ought to be turned over to the State Mining Bureau, where it properly belongs. At present it is practically useless. It is rarely seen by visitors, and scarcely ever by the class for whose instruction and benefit the State intended it should be preserved. On the contrary, if placed in charge of the Mining Bureau, it will be seen by the thousands who yearly visit the institution, and be the means of disseminating information regarding the worth and value of the mineral products of the Pacific Coast. The State Librarian strongly advises that this course should be pursued. Writing of the want of space in the library, he says:

"We are much crowded for space for the books we receive, owing to one of our large rooms being occupied by the mineral cabinet. This room is not convenient of access for the purpose for which it is used; we have neither authority nor means to care for and make additions to the cabinet collection; nor have we help sufficient to show and make it a pleasure to visitors. It is practically valueless where it is, and I therefore suggest that it be removed and the room properly fitted up for library use. Legislative action is necessary to the accomplishment of this."

THE GOLD SURPLUS.—Chicago *Times* Washington special: Whatever danger there was some time ago that the treasury supply of gold would give out and the Government be compelled to pay out silver for bond redemption, seems now to be remote and growing more so. The gold owned by the Government now amounts to \$170,912,413, a larger sum than the Government has owned previously since the resumption of specie payments, with the exception of the single month of November, 1881. The stock of gold has been growing continuously since July last in spite of the large redemption of bonds. The increase in the stock of gold for December was a trifle less than \$7,000,000, and for the half fiscal year a little more than \$14,000,000. At the same time the stock of silver dollars which recently threatened to absorb everything in the treasury has been for some months steadily falling off, though coinage goes on without interruption.

NEW PLACER MINES.—The placer mines in North Bernalillo county, near Golden, N. M., are the richest in the United States. Recent tests from the grass roots down—not reaching bedrock—averaged over \$2.50 per cubic yard. Miners are flocking into Golden daily. The quartz leads a few miles north of Golden are yielding very rich ore, and the miners who have secured claims in that vicinity are all counting money. It is the coming camp in the West.—*Albuquerque Journal*.

Silver in Litharge.

At a recent meeting of the American Institute of Mining Engineers, Prof. Chas. Wait, of Rolla, Mo., read the following paper on "the condition of silver in a sample of litharge:"

In the analysis of a set of interesting furnace-products belonging to the metallurgical cabinet of the School of Mines, I placed in the hands of one of my students a sample of litharge which gave the results quoted below. The collection of specimens from which this was taken represents the products obtained in the blast-furnace treatment of argentiferous lead ores, also samples from the zinc process, and those from the cupellation of the enriched lead.

The sample, when received, was marked "bismuth litharge," and was that obtained during the last stages of cupellation. It gave upon analysis the following:

	Per cent.
Lead	85.36
Antimony	.06
Bismuth	.20
Copper	.49
Iron	.60
Zinc	.18
Nickel	.01
Silver	2.94
Linne	.26
Magnesia	.03
Silica	.03
Sulphuric anhydride	.12
Carbonic anhydride	1.25
Water	.24
Oxygen	7.80
	99.95

At present I wish merely to call attention to the large percentage of silver present (equal to 857 ounces Troy per ton of 2000 pounds avoirdupois), and also to note two or three determinations that I have recently made, with a view to ascertain, if possible, the condition in which this silver exists.

If I mistake not, it is usually assumed that silver exists in litharge in the metallic state; and it is, indeed, in the analyses of litharge, rarely expressed otherwise. This method of reporting the silver is, no doubt, due to the accepted statements that the oxides of silver are reduced to the metallic state at a temperature of 300° C. or less.

The following experiments lead me to believe that silver exists in litharge, not entirely in the metallic state.

1. A weighed sample of litharge was digested in boiling acetic acid for about half an hour. The solution was filtered. The filtrate gave no reaction for silver.

2. Same experiment as above with continued boiling. The solution being filtered, the filtrate gave no reaction for silver.

3. A sample was placed in cold acetic acid, then heated to boiling. The solution was filtered, and silver was found in the filtrate. The estimation gave: Silver dissolved, 19.25 per cent of the silver present in the litharge.

4. A sample was treated as in the last experiment. The estimation gave: Silver dissolved, 18.67 per cent.

5. A sample was placed in cold acetic acid, and gently warmed for a few minutes. The estimation gave: Silver dissolved, 10.47 per cent.

6. The residue in experiment 3 was examined and found to contain 2.7 per cent in lead. The sample in each experiment weighed one-third of an assay ton.

I have placed the following interpretation upon the results obtained above: In Nos. 1 and 2, if silver in any form whatever was dissolved, it was in turn reprecipitated by boiling. In Nos. 3 and 4, the silver dissolved did not, in all probability, exist in the metallic state. In No. 5, the solution was not sufficiently heated. In No. 6, the lead which remained undissolved probably existed in a rich alloy with silver, which resisted the action of the solvent.

A few experiments were made which assisted me in interpreting the above, by showing that neither metallic silver reduced to fine subdivision by mechanical means, nor silver freshly prepared by zinc from silver chloride, is soluble in acetic acid, while argentic oxide is soluble in that acid. A solution of silver oxide in acetic acid was precipitated completely by metallic lead.

From the results stated above, I believe we are justified in our conclusion, that silver may exist in litharge in a form other than in the metallic state. In this case, the analysis shows the percentage of silver to be very large, which, no doubt, is due to quick and hot work; and if the oxides are decomposed at 300° C. or less, in what form, then, may I ask, does this silver exist?

In the direction of an answer I will add, that some experiments have shown me quite satisfactorily that silver is not an exception to the metals to which litharge gives up a part of its oxygen when fused with them for a considerable time.

ALUMINUM IN SAN DIEGO.—Aluminum is believed to exist in this county in large deposits. Samples of this valuable metal, or rather samples of a metal which bear the strongest possible resemblance thereto, have been shown a *San* reporter, and the mayhap lucky prospector, who alone knows the place of its existence, will at once proceed to ascertain the real value of his discovery.—*San Diego Sun*.

THE SILVER MONUMENT MINE, Humboldt district, Arizona, during the past four months, has shipped to reduction works over \$30,000 worth of ore.

Self-Murder and Society.

The frequency with which men and women, and even children, resort to suicide as a means of escaping real or imaginary evils, is a subject of almost daily comment. Scarcely a paper issues that does not chronicle a fresh case of self-murder. From what cause springs this alarming tendency to self-destruction? Our social philosophers, insurance men and fraternal men are toiling at the problem. When it is proved before a coroner's jury that the suicide had domestic trouble, or reverse of fortune, or was intemperate or in poor health, or had been disappointed in love or ambition, all inquiry ceases. But a good theory is one that seeks to group all the infinitely various determining motives in the unity of one primal law. Can such a law be discovered? In what direction shall it be sought? The great Italian alienist, Henry Morelli, in his elaborate essay on suicide, says: "The motives which impel the suicide to quit life are not beyond social laws; indeed, man would never have destroyed himself if he had lived far from other men, and had not shared in the misery of his fellow-creatures. The more humanity advances, the more it tends to the common association of forces; therefore, the savage appears to be freer in his virgin forest than the civilized man in his splendid cities." Here is foreshadowed, perhaps, the direction in which the final solution may yet be found.

In the mean time it is evident that the organizations of capital and labor have robbed both rich and poor of their individuality and made all men mere parts of a machine. Before the era of railroads and steamboats and telegraphs every shoemaker, tailor or blacksmith had his own shop, but now these and all other forms of artisanship are merely parts of a machine, and this machine usually takes the form of corporate control. Even the men who manage the machine are parts of the mechanism. Life is reduced to a time-table. We eat and run to work by the ring of a bell or the shriek of a steam whistle. In short, nearly everything pertaining to existence in these days is so nicely adjusted that life has become a treadmill monotony, and perhaps it is not too much to say that nine out of ten who commit suicide are impelled to it by the dull and joyless barrenness of their lot.

Then, no doubt, many men and women commit suicide in these days not because they have loved and lost, but because they are unable to find anything to love. How many men and women can say that they have one true, tried and devoted friend? We once knew a man who advised all his acquaintances when they were in trouble to go and tell their wants and grievances to the wooden Indian that stands before the cigar store. He believed that half the world would agree with him that the advice was good. It is at least certain that one reason of the frequency of suicide is the fact that everything is so arbitrarily and nicely adjusted that there is no time nor room for friendships. Whatever may be the immediate cause, we may be certain that life to the unfortunate has become void and barren of hope. Men of the church, men of our fraternal Orders, think of this! You may help to remedy this evil in some degree. It is obvious that the only cure is in the nature of a preventive; in whatever more evenly distributes the burdens of life and helps to make the world more bright, joyous and beautiful.

NEW MILL.—Burger & Co. are now putting up a ten-stamp mill near Campo Seco, in the western part of Calaveras county, for working gold quartz. The company has a mine that will pay \$10 a ton, and with this grade of ore they expect a handsome profit. One mile south of Campo Seco an English company is erecting an 18-horse power centrifugal mill or crusher, to be used in a gravel claim. This mill is of a late patent, and will be the second of the kind in use on the Pacific Coast. It is a novelty, and is considered by good judges to be a great success. The machine consists of a strong box and two short shafts a foot, more or less, in diameter. These shafts go through the box at opposite sides, and the ends (which are concave) do not touch inside the box by 10 or 12 inches. Outside of the box the shafts are provided with drums and belts, and are made to revolve with astonishing rapidity in opposite directions. A vacuum is thus created between the inside ends of the shafts and the gravel drawn up, and as one stream goes one way and another mass of gravel goes in the contrary direction, it is by its own friction ground to an impalpable powder, and then forced through sieves in the side of the box. —*Stockton Mail.*

THE HIDDEN TREASURE.—*Placer Republican:* The Hidden Treasure mine, at Sunny South, was located in January, 1874, by M. H. Power, W. Cameron, H. K. Devey, L. P. Burnham, R. J. Thomas, J. Mutchler, E. R. Guilford, S. Huffaker, D. Roberts, and G. C. Coker. The first pay was struck in the spring of 1876, but no gravel was taken out until the spring of the following year. Since then the gross yield of the mine has been \$950,000, with a net profit of over \$250,000. The character of the gravel is white quartz and the tunnel is about 6000 feet. The track in the tunnel is laid with steel rails, 30 pounds to the yard, and 40 cars are used for removing the gravel. The width of the channel varies from 200 to 400 feet, and a force of 75 men are employed at the mine. The

altitude of the tunnel at the mouth is 3700 feet. The gravel is so soft that it does not require milling, but is washed at the dump where there is a capacity of 500 carloads, while the water comes from the mine. There has never been an assessment levied since the company commenced to extract gray gravel, and the future outlook of the Hidden Treasure is most promising.

Mexican Bullion and Coinage.

Mexico has been yielding an average of over \$20,000,000 per annum in silver for many years. The total for the last fiscal year of 1885-86 was as follows:

Silver bullion	\$26,000,000
Gold bullion	450,000
Total	\$26,450,000

The silver product of Mexico has increased from \$21,400,000 in 1877-78 to \$26,000,000 in 1885-86. The gold produced in the same interval has varied from \$380,000 to \$662,000. The yield of both metals for the past nine years has been as follows:

Silver bullion	\$212,632,500
Gold produced	4,107,013
Total, 9 years	\$216,739,513

Comparatively little silver bullion is exported from Mexico, the bulk of the product being sent to the private mints for coinage. These mints are reported to have coined \$25,850,000 in silver dollars and \$425,000 in gold dollars in the last fiscal year, or within \$175,000 of the total bullion product for that year. There must be some mistake at this point, because Wells, Fargo & Co.'s express handled \$1,627,200 in silver bullion from Mexico last year and \$469,500 in gold bullion. The coinage of the Mexican mints for the last 14 fiscal years was as follows:

Silver dollars	\$317,964,419
Gold dollars	8,449,164
Total, 14 years	\$326,413,583

More than one-third of the silver dollars coined in Mexico last year passed through San Francisco en route to China.

A FIRE-VOMITING GEYSER.—The greatest discovery of the age was made in the Bad Lands Wednesday morning. Two hunters who have been camped in that region for several weeks, were awakened by a terrific shock and a roar that sounded like the rushing of a mighty torrent. Running out of their camps, they saw a stream of fire over 100 feet in height, shooting into the atmosphere. This immense blaze poured through the crust of earth for over an hour, when it ceased. In about five minutes after the cessation, another eruption took place, the flame being about 30 feet high, but this was followed, in about ten minutes, by another blaze nearly as high as the first. It is the greatest and most interesting discovery made in the Northwest for many years, and is the first geyser of fire, as it has been christened, to make its appearance in the land of endless wonders. It is accounted for by the fact that there are numerous beds of coal constantly burning in the Bad Lands, and this is the result of the bursting forth of the united gases. All who have passed through the Bad Lands by way of the Northern Pacific have been interested in the burning veins of coal, which rains, snows, and years have failed to extinguish. The phenomenon which made its appearance yesterday is said to be located about ten miles south of the Northern Pacific road, and if it does not die out, will be the greatest attraction on the American continent. When last heard from, the flames were being emitted about every 15 minutes, and varied in height from 10 to 40 feet. The aperture in the ground is small, and the noise that accompanies the eruptions is like the roaring of a cataract. —*Bismarck Tribune.*

CONDENSING FROM MINE PUMPS.—D. H. L. asks how to get rid of the exhaust in the mines, on account of the unpleasantness of steam. Tell him to attach a special condenser. I will tell you what I saw in Wyoming about 14 years ago. The Rock Springs coal mine had a Cameron pump with about a four-inch discharge to keep the water out of the mines. The boiler to the pump was on the surface, and the pump was over 300 feet away. A few feet below the pump there was a tee in suction, and one branch ran a few feet to what the miners called a sump, and the straight pipe ran about 80 feet further to another sump. Each pipe had a stopcock to regulate flow, and the pump drew from bottom at once. The exhaust was run into the sump near the pump, and the water allowed to cover the end of the exhaust pipe about four inches, or enough to keep the exhaust from opening the water and escaping into the air. The height of water in pipe was regulated by the stopcocks, and the water ran in fast enough so that the temperature was raised but a trifle. This arrangement seemed to work good, and as the pump only made about 75 or 80 revolutions per minute, the back pressure was slight. —*Frank Hill in American Machinist.*

THE PEOPLE AT UKIAH are delighted over the prospect of an early connection by railroad with the outside world. The final survey of the Cloverdale & Ukiah railroad was completed to Ukiah, Mendocino Co., last week, a distance of 29 miles, under the management of Engineer Frank K. Zook.

Food Adulteration and Congress.

A national convention is called to convene in Washington City, D. C., the 19th of this month, for the purpose of securing congressional legislation against food and drug adulteration. The evil is national in extent, and it is quite impossible to secure uniformity of action between the States, and the consequence is that if one State makes a stringent law, the people who live on the borders of a State that permits adulteration would be poorly protected. The benefit of congressional legislation would be that a law preventing the manufacture and sale of adulterated food and drugs would be uniform, at least so far as importation and interstate commerce in vitiated provisions is concerned. It is time something was done, and no uniform and vigorous remedy can be applied by isolated State action. The extent and variety of food and drug adulteration would seem incredible were it not that the facts have been officially ascertained. There is scarcely an article of food that can be bought with any assurance of purity and wholesomeness. Trade guarantees are worth nothing. If manufacturers and dealers have no more principle than to persist in silently, under the cover of the mysteries of their business, to adulterate and poison provisions, drugs and delicacies, there is but one redress left, and that is summarily to break up the whole business, by stringent legislation. A good beginning was made against fraudulent butter in the shape of oleomargarine; let the good work go on till the market is thoroughly purged of this class of frauds.

The protection of the life, health, property and happiness of the people is the primary aim of government. It should stand as a wall of fire between them and all invasions from without or violence within; from open assault or covert danger. It is for this protection the people pay their taxes and give their personal valor in time of war. Where does this protective function of the Government cease? Has it done all that should be expected when it hurls back the invader, subjugates treason, puts a stop to smuggling and counterfeiting, punishes murderers, burglars and incendiaries? By no means. It should punish the adulterators of meat and drink as rigorously as robbers and murderers. They are worse than the average murderer who kills in a heat of passion, for they kill off thousands of innocent people by the slow processes and homeopathic doses of dirt, nastiness and poison, from the sheer lust of gain. The Borgias and others of that accursed race were actually less culpable. They killed units, while the modern vender of deleterious compounds insidiously assails the health of a whole community and shortens the average duration of human life. Better a thousand times an occasional dose of poison by a Madame Brinvilliers than vile, unwholesome admixtures in our sugar, syrup, coffee, tea, pickles, canned fruit, lard, butter, oil, curry, and a host of other articles in every-day use.

When a president of some great manufacturing concern runs away with the funds, the newspapers all have words of sympathy for other capitalists and corporations that are involved, but seldom mention the poor workers. They are really damaged more in proportion than the money-lenders, for the latter only lose from their surplus, while the former suffer for the necessities of life. They are likely to have small wages still further reduced, and perhaps withheld for weeks, and the chances are that many of them will be thrown out of employment altogether. —*Hartford Examiner.*

EVERY human being who is not born to a fortune has a labor problem of his own to solve, and the time will probably never come when a very large number of men will not keep trying to make somebody else solve it for them. The greatest need of our age seems to be the huckling of each man to his own labor problem. Every man should try to help his neighbors to hear his burdens, but every neighbor should refrain from trying to unload on him. —*Evening Post.*

THE CLAY STREET TUNNEL.—The matter of granting permission to the Clay-street cable line to cut a tunnel under Lafayette Park was considered last week by the Street Committee of the Board of Supervisors. The majority of the members expressed themselves as being favorable to the proposition, but they deferred definite action until after they have made a thorough examination of the ground. If the permission is granted, the cable line will be extended to the park.

The combined outflow from 26 artesian wells sunk in Sierra Valley is 767,520 gallons every 24 hours. The most expeditious work done was the sinking of three 600-foot wells in one week. The wells range in temperature from 40 degrees to 130 degrees. In all cases the water has proven to be good and palatable, both for drinking and culinary purposes, and much superior to any surface water for washing. Cattle and horses invariably drink of it with great avidity.

STOPPING THE FLOW OF WATER IN SHAFTS.—Mr. L. Tietjens, of Stassfurt, Germany, has recently patented an ingenious method of damping back the flow of water in shafts by the application of the well-known fact that certain salts increase their volume very materially by

the absorbing of water of crystallization in hardening. To accomplish this he takes either calcined soda, anhydrous alum, kieserite, or oxychloride of magnesium, mixes them into a paste, and then immediately injects them through a suitably arranged pipe into the fissures through which the water flows. It is said that as this paste hardens, it swells enough to fill all the interstices of the rock and to render it water-tight.

Lick Observatory.

Its Transfer to Be Made in July.

Prof. Edward S. Holden, president of the State University and director of the Lick Observatory, has returned from a six-weeks' trip to the East, where he has been making some final preparations for the completion of the Lick telescope and observatory. He has contracted for the construction of a micrometer and spectroscope among other things. The former will be made by Fauth & Co., of Washington, and the latter by Brashear & Co., of Pittsburgh. Both instruments are to be completed by June 1st. The contract for the stellar spectroscope calls for the finest and most powerful glasses in the world, and by its results of great importance are expected. The use to which it will be devoted will be the determination of the motion of stars in the line of sight, from which the real motion and that of the entire solar system in space can be determined. While the relative motions of the component members of the solar system are not known with precision, the motion of the system itself is yet understood with comparative imperfection. Observations with the spectroscope on certain distinct stars to determine their relative changes of position have been made to some extent at the Greenwich and other observatories, but the spectroscopes used are inferior to the one which is now being constructed.

Prof. Holden says that the expectation is that the formal transfer of the observatory buildings and instruments will be made in July. The mounting for the crown and flint lenses and the dome will, it is believed, be at Mount Hamilton by June 1st. As assistants, Prof. Holden will nominate S. W. Burnham, of Chicago, and J. E. Keeler, who is now at the observatory. Mr. Burnham is at present the official reporter of the United States District Court at Chicago. "He has devoted himself to practical astronomy in his leisure hours, and he is the most celebrated observer of double stars in the world, having himself discovered over 1000 such. He visited the Lick Observatory at my request in 1879 and made observations for three months there, and again in 1884 joined with me in the observation of the transit of Mercury. He is also one of the best astronomical photographers. He will work with me on the large telescope. J. E. Keeler has already been in the employ of the Lick trustees for several months. He is a graduate of Johns Hopkins and Berlin universities. For a long time he has been the assistant of Prof. Langley, the famous observer of the sun, at the Alleghany Observatory. Mr. Keeler is a specialist of reputation in astronomical physics, and will devote himself mainly to observation with the spectroscope."

The leading astronomer of the world will be invited to the observatory, and will be likely to accept the invitations to be offered them.

GENIUS, TALENT AND TACT.—THE WAY THE WORLD GOES.—The man of genius is busy; the patent examiners groan and wonder when they will all die. The man of talent sifts the ideas of the genius in order to find something that has commercial value, and when he does hit a kernel of wheat, he straightway looks for a man of tact, and they two devise a scheme to rob the genius of that, whose birth robbed him of much "gray matter." This is the era of invention, and thousands are busy solving the problem how to get something for nothing. We hear of the successes, but who hears of the failures? It was said, many years ago, that the genius goes hungry, dies in the garret, but his glory comes after he has died. The man of talent is useful, when properly steered; is shabbily genteel, and is known while living, forgotten when dead. The man of tact is a power in life, is courted, flattered while living, piles up brick and stone to serve as monuments of his greatness; but his grandchildren learn all his efforts were in vain—the city has grown, and his monuments are sacrificed to make room for the hordes who have small respect for "dead men's bones." So goes the world.

REDUCTION WORKS.—Good reduction works are needed in the Ophir district and would pay. It is close to the railroad, water-power might be had, and the place is situated in a district full of rich but refractory quartz. Works with the latest improvements and devices might do as well as at San Francisco, Reno or Denver. —*Placer Republican.*

SALT ARTESIAN WATER.—An artesian well being sunk at White Plains, Nev., is down over 2300 feet, and can go no further until the water, which is 17 per cent salt, and so heavy that the ropes and tools float on it and the drill does not penetrate the rock, is shut out.

PLACER MINES, in Arizona, are yielding from \$2 to \$5 per day. The separating of the gold from the gravel is being done in rockers.

SAN FRANCISCO:

Saturday Morning, Jan. 15, 1887.

TABLE OF CONTENTS.

EDITORIALS.—James Lick; Mohave Mines, Arizona, 33. Passing Events; Mining Mistakes Further Considered; Water Power Stamp Mills; Foundry Notes, 36. The Legislature; The Penberthy Automatic Injector; Borax, 37.

ILLUSTRATIONS.—The Lick Observatory at Mt. Hamilton, 33. Fig. 1—Penberthy Injector; Fig. 2—Sectional View of Injector; Fig. 3—Mode of Connecting Penberthy Automatic Injector, 37.

CORRESPONDENCE.—Remains of Mastodons; Sulphur Creek District, 34. Roasting and Leaching of Silver Ores, 37.

MECHANICAL PROGRESS.—The Principle of the Injector; Old Horsebores—How They Become Valuable; Is it a Curse; Flue Dust; Casting Iron or Steel Upon Brass; Iron and Steel Tools; To Soften Copper Wire, 38.

SCIENTIFIC PROGRESS.—Subterranean Atmosphere; Photographic Astronomy; Meteor Showers; A Sensitive Compass; Discoloration of Glass; The Color of the Buttercup; A Large Mule; The Mount-Builders; Skeleton of a Whale on a Mountain Top, 38.

USEFUL INFORMATION.—Composition to Attract Dissolved Crystals; How Horses Rest; For Cleansing and Whitening Inside Walls; Dress Coats and Vests Combined; A Convenient Measurement; Crushing Resistance of Brick; The Severn Tunnel; Copper Covered with Steel; Oilcloth; Water in Lead Pipes; Railroad Gauge at the South; To Soften Wrought Iron; Paper from Palm-leaf; Patent Leather; A Handy Pen-Wiper, 39.

GOOD HEALTH.—Lanolin—A New Oil; The Vertigo of the Kajak; Dust and Dusting; Want of Companionship and Ill Health; Sleep a Preventive of Headache; Diphtheria and Manure Heaps; Danger in Nickel-Plated Ware; Deaths from Being Struck by Falling Meteors, 39.

MISCELLANEOUS.—Spontaneous Combustion in Mines; The State Mining Bureau; Silver in Litharge, 34. Self-Murder and Society; Mexican Bullion and Coinage; Food Adulteration and Congress; Lick Observatory, 35. The New State Government, 39.

Passing Events.

The discovery of natural gas in several portions of this State has led to further prospecting, and it is not improbable that in another year several localities will be supplied with it. A supply of this material will be of the greatest use on this coast, where coal is high priced.

Several of the northern counties of California have established immigration bureaus at Los Angeles in order to set forth to new arrivals the advantages of other sections than Southern California. Much cheaper land and that which is just as productive can be had in the central and northern portions of the State, but Southern California has been so well advertised that it is attracting most of the population.

The remains of James Lick, the California philanthropist, who died over 10 years ago, were deposited in the final resting-place this week, in the pier which supports the great telescope, provided by his munificence, at Mount Hamilton, Santa Clara county.

Water is scarce in the mountains, and, as little snow has fallen, no very long winter season is expected in those parts of the State where it is needed for mining purposes. The farmers are also becoming nervous about the scant supply of rain this winter.

Mining Mistakes Further Considered.

Remarking further on the mistakes most common in mining, it may be observed that among these is the practice so prevalent with miners of dividing up their work on a number of claims instead of concentrating it on one or two, and so developing these that they can be made a source of income to the owners, while they are brought into presentable shape at the same time for the market. It is true, investors would find it at this day much to their advantage to buy mere prospects, and at their own expense do the work of development upon them. But experience shows that thus far they have not, as a general thing, been willing to do this. Wherefore, the claimholder, if he desires to effect a sale of his property, will, in order to accomplish this, have to do enough work on his location to show that it possesses some real and tangible value. This done, there is a chance of his getting buyers to look at his mine, but none without it. There is something of a disposition being shown just now to invest in the gold mines of California; but, unaccountable as it may seem, nobody cares to buy a mere undeveloped prospect, however promising it may be, or however little may be asked for it. Of course, we look for a change in this respect; but we are now consulting the interests of miners under existing conditions and write for the present.

Another of the old-time mistakes consists in putting up reduction works before ore developments warrant the same. This is a mistake that, incredible as it may appear, meets with constant repetition, the late costly Iron Mountain outfit being a case in point, not to mention the two notable examples that occurred not long since in the vicinity of Sierra City, one of the oldest quartz-mining localities in the State. What aggravated the mistake in this instance was the fact that these costly improvements were made under the advice of several prominent mining experts, and the failure of these enterprises entailed heavy losses on the investors. One of these mills has since been removed and put up elsewhere, the other remaining a monument of dead works and financial ruin on the spot where it was first planted. It really looks as if our miners would never learn business sense in this particular, the proclivity to anticipate requirements of this kind appearing to be inherent to the business. It is, however, gratifying to learn that the Iron Mountain fiasco has had a salutary effect in Shasta county, the site of its occurrence, inspiring the hope that similar blunders will there be avoided in future. But Shasta was not without similar lessons before. There are standing along the south fork of Clear creek, and within a space of two or three miles, several large and costly establishments put up there many years ago for beneficiating the rich but rebellious ores of that district. But they all proved signal failures, and having been idle for a long time, remain now partially or wholly dismantled. Lately the plan of concentrating these ores has been adopted, and as this can be effected with cheap and simple machinery, the business has been found to be profitable, these concentrates, which are of high grade, being sold to the Selby Smelting Works. While such is the method of treating the silver-bearing ores of the above district, the auriferous quartz, which occurs in small, rich veins, is crushed with arrastras, this, again, having proved a better way for disposing of this class of ore than working them in large mills, as formerly practiced. Having hit at last upon the right method, the Shasta miners will now be likely to prosper if they adhere to them. Like many others, they found out by experience that they had something to unlearn as well as to learn.

There are other mining camps in Shasta, and in Trinity county adjoining, where the inhabitants, by going a little slow and opening up their mines well before buying expensive plants, have succeeded in placing the business on a profitable footing. Though advancing rather slowly, they have all the while been progressing, and have yet to make their first failure.

Now, lest investors should jump at the conclusion that this is the place to go to buy mines, let us inform them that it is not—there are no mines there for sale. The owners are nearly all practical miners. They live on their properties, and, having opened and equipped them in good shape, do not care to sell them, well knowing that they are worth more to them than

they can be to anybody else. The most of these men have lived in these several districts for many years, and, being familiar with the vein system, know best how to open the mines and work the ores. With all these advantages, having at last got their properties into a productive condition, they are not, as a rule, anxious to part with them. Then, while these mines can so be worked with profit by the present owners, they are not, as a general thing, extensive properties, such as would require heavy capital to work them to advantage; hence they do not invite large investments.

But having got his mine fairly opened and equipped with suitable plant, it has been too little the habit of the California miner to keep the work of exploration well ahead of ore extraction. While this is a point that in older mining countries is carefully attended to, it has here too often been neglected.

It has been with us too much the practice to go for immediate results; to care for the present, leaving the future to care for itself. We have preferred for our mines a short and fast rather than a long and healthful life. This policy must be amended before mining can establish itself in favor with conservative investors, who will embark their means only in ventures of a solid kind. They prefer long-continued, steady, and certain returns, even though small, to such as are always fluctuating, and even though for the moment large, are likely at any moment to end. The hand-to-mouth style of mining is at best precarious, and must, to all concerned, prove unsatisfactory, if not finally ruinous. It is deficient in the primary element of a safe business. It is like a merchant realizing on his stock and making no provision to replace it, or a forester cutting down his trees and planting no new ones.

What renders advance exploration the more imperative is the rapidly exhaustive styles of mining practiced at the present day. With the tremendous engine now in use, ore is extracted and disposed of at a rate that makes it unsafe to trust to small reserves, which, giving out unexpectedly, may bring operations to a dead halt. The miner should remember that it costs no more to do this sort of work at one time than at another, and being done in good season enables him to shape his course accordingly.

It would be well if our miners would pattern more after those engaged in other branches of business. This would tend to make them more persevering, painstaking, and patient; teach them that it is not always the best policy to make haste to be rich. They should reflect what of time and toil, what of study, anxiety and self-denial, it takes for a merchant or a manufacturer to build up a profitable or even a living business; what a deal of sweating, waiting and grubbing it takes to improve a farm or cultivate a vineyard. If the miner would work and save, and forecast the future as do men following these other pursuits, a large and almost sure success would await his efforts. His vocation is an honorable and useful one, but it is the misfortune of many engaged in it that they have, during the flush days of the business, been betrayed into the habit of trusting to luck or otherwise too much discounting the future.

Water-Power Stamp Mills.

The use of water-power for running quartz mills, hoisting apparatus, etc., is gradually increasing on this coast. In Nevada county it has been particularly successful, and even the big 120-stamp gold mill at Douglas island, Alaska, uses water for power. The excellence of the Pelton and Knight water-wheels has had much to do with this advance, both of these appliances being powerful and economical. Of late, wherever it has been possible to obtain water for power, even when it has to be conveyed long distances, water-wheels have been put in instead of steam engines. Of course there are many places where this cannot be done, but the matter is being investigated in many mining regions where heretofore it has not been thought of.

On the Comstock the deep pumps have been run by hydraulic power for a long time, though since the closing down of the work on the lower levels these big pumps have stopped. Now, however, the Comstock mine-owners are desirous of having cheaper ore-crushing facilities, so as to work their abundant low-grade ore more cheaply than before. The Chollar and Potosi

Mining Companies have purchased a site east of the Chollar old shaft upon which to erect the first of a series of quartz mills, with 40 stamps each, to be operated by water-power, for crushing ore from the two mines. The water for driving the mills will be supplied through a new flume, now in course of construction, between Virginia City and Marlette lake, located in the Sierra Nevada mountains, near Lake Tahoe, 27 miles distant from the Comstock lode. The water will be conveyed 20 miles through wooden boxes and carried across the Washoe valley through a 12-inch wrought-iron tube in the form of an inverted siphon. The pipe was manufactured in Pittsburg, Pa., and is seven miles long, and is now in transit. The management anticipate having the water in and the first mill in operation by the middle of next June. The water heretofore used in operating the hydraulic pumps at the Combination shaft will be utilized as an auxiliary motive power for driving the projected mills, and will add a flow of 2,000,000 gallons daily to the pressure. Other mills will be subsequently built in Six-mile canyon, the abrupt fall of which will admit of water being caught up, and by fluming it a mile lower down, fall sufficient will be obtained to propel another mill of the same capacity. The projectors ultimately contemplate the erection of seven mills between the workings of the Comstock lode and the mouth of Six-mile canyon with a combined crushing power of 280 stamps and a pulverizing capacity of 1000 tons of ore daily.

Foundry Notes.

The Risdon Iron Works have had more or less quartz-mill work of late. The 30-stamp mill for the Rathgeb mine, San Andreas, has just made its first cleanup, and a very satisfactory one, too. The mill is owned by an English company. A new 30-stamp mill being built for W. B. Bourne, for the North Star mine, will be ready for work on the 1st of February. It will be run by water power. The Ives mill, at Shingle Springs, is to have pans and settlers, which are now being made at the Risdon. The gold is so fine that the ore will be worked in pans just like a silver mill. Two of the Bryan patent quartz mills were shipped two years ago to Mexico for a mine belonging to Mr. C. Waterhouse, and have given satisfaction. The Risdon works will take measures for introducing these mills more generally.

They are putting in a good many of the Fox corrugated furnace flues, recently illustrated in the PRESS. They are being used on marine and land boilers. Some 18 of the furnaces are being brought out here for the new boilers of the City of Pekin.

A number of the Heine boilers are being sold also. One has recently been built for the king's palace at Honolulu, which is highly ornamented. It is covered with crowned heads, gilt, etc. It is intended for part of the plant for lighting the king's palace with electricity. The Risdon works are also doing considerable sawmill work. They are furnishing several of Robbs' patent saw edgers, one very large, to edge 12-inch timber, 60 or 70 inches wide.

The Union Iron Works have removed their downtown offices from the corner of Market and Fremont streets to the north side of Market street, No. 216, almost opposite the old location. The removal was necessitated for the reason that the old building is to be torn down to give place to a large new one.

The Fulton Iron Works have nearly completed the machinery and boilers of the new ferry-steamer for the South Pacific Coast R. R. Co., and a very large force of men are engaged in the construction of the hull. The new steamer will be similar in plan and construction to the Garden City, and will be built to accommodate either freight or passengers. The cabin accommodation will be particularly elaborate, while the tonnage will be somewhat greater than either the Bay City or the Garden City.

If the several projected quartz mills to crush the low-grade Comstock ores, and to be run by water-power, are built shortly, our local foundries will obtain some good jobs. The combined capacity of the mills will be about 280 stamps.

The San Francisco Tool Company is engaged in making a number of centrifugal pumps.

It is rumored that the office of State Chemist is to be recreated.

The Legislature.

The members of the Legislature have so far spent most of their time in filling places and causing concerning places to be filled. The flood of bills has commenced to pour in, however, some of these being relics of the last session. Among those measures proposed which will interest our readers may be summarized as follows:

In the Senate, Goucher has introduced a bill appropriating \$125,000 for the maintenance of the State Mining Bureau. This far exceeds previous appropriations, and should it be granted, would place the Bureau out of its present impecunious condition, and, of course, admit of greatly extending its usefulness. Moffitt's bill to establish a State weather bureau appropriates \$5000 for the wants of stations, and \$6000 for carrying on the necessary work. Rose's bill declares the last Saturday of January a legal holiday, to be known as Arbor Day. Walrath has an act providing for the impounding of mining debris. Rose has a measure to enlarge the powers of the Board of Forestry as sheriffs, and also to appropriate \$30,000 for salaries for two years. McCarthy's act regulating State prisons provides that no labor of convicts be allowed, except in the jute department. Vrooman wants to provide for the permanent support of the University of California, by levying annually a tax of one cent on each \$100 valuation. Jones wishes to amend the act giving a lien to loggers and laborers upon the logs cut and hauled by their employers. A bill by McCarthy is to provide for the better protection and security of life and property in the use of steam boilers. It provides for the appointment of an Inspector of Boilers.

The Assembly bills are very numerous. Seary's bill, regulating the employment of gripmen, conductors and drivers on street railroads, provides that such railroad corporations may not place a gripman, conductor or driver on any car unless he shall be duly licensed, said license to be free, but only to be granted to a person who has had three months' service as an assistant in such work. In case of accident to any car or dummy, if it shall appear that such car was in charge of an unlicensed person, it shall be proof of willful negligence on the part of said employers. A violation of this Act is punishable as a misdemeanor by imprisonment in the county jail of from one to three months.

Ohleyer's bill, relating to contempt of court, makes a repetition of the offense a felony. As the law now stands, large corporations are continually paying repeated times for breaking the law; in other words, paying a license to commit illegal acts. This bill proposes to check this.

Lawrence's insurance bills place assessment associations, insurance orders, etc., on the same footing as the regular companies. He will shortly present another bill in which it is ordained that all telegraph wires shall be laid underground.

Bost has an Act to promote irrigation, and regulating the distribution of water used therefor. It provides that the Governor, Surveyor-General, Attorney-General and State Engineer shall constitute a Board of Irrigation Commissioners to divide the State into irrigation districts and organize the same; the board to have the control of all the water in reservoirs taken from river-channels, etc., during the rainy seasons as may be needed in the several irrigation districts.

Cohen's Act, to protect the manufacturing interests of the State, compels manufacturers to label their goods. Regan has an Act similar to Senator McCarthy's on the subject of security of life and property in the use of steam boilers.

STEAM PIPES AND WOODWORK.—The Fire Underwriters' Inspection Bureau call the attention of property-owners, architects and builders to the great danger of steam pipes in contact with wood, and ask their assistance so that in future the provisions of Order No. 1752, Section 28, of this city and county, shall be complied with. This order provides that no steam pipes shall be placed nearer to wood than three inches, unless protected by a ring or tube of soapstone or earthenware.

THE California State Board of Forestry has issued its first biennial report for the years 1885-86. The report is received just as we go to press, so we have had as yet no opportunity to examine it.

The Penberthy Automatic Injector.

This injector is intended for stationary, marine and portable boilers, and is so made as to be automatic and restarting at every point within its range. The engravings given herewith show its construction and application. Fig. 1 is an outside view of the injector. Fig. 2 is a vertical view in which *A* is the tail pipe, *BB* steam jet, *C* suction tube, *DD* delivery tube, *E* ring, *H* valve, and *K* overflow cap. A great advantage of this injector is its inside mechanism, which consists of a removable delivery and suction tube or jet. This makes it easily cleaned, and there is little or no wear on the body, so that when the different tubes are replaced the injector is as good as new. It will work well in smooth or rough water at sea; and no matter how much air gets into the suction pipe, the injector will expel it and continue working. The working range is from 20 to 135 and 150 pounds steam pressure; will lift water

in the suction pipe full, also the valve *D* in the steam pipe, and in a short time the water will appear at overflow. Then gradually close the valve *H* in the suction pipe *I*, and the water will stop at overflow when the injector will be working. As steam rises, the valve *H* can be gradually opened until the injector takes all the water. Where this variation of steam used is not over 40 pounds after the valve *H* is once set, it is only necessary to turn steam on and off and the injector will start automatically. A leak at the overflow is caused by too much or not enough water, or a leak in the suction pipe. When a long lift is used, it takes several minutes to bring the water to overflow.

Borax.

Until 1872 all the borax used in this country was either imported as such or was manufactured here from imported boracic acid; but

Fig. 1.—PENBERTHY INJECTOR.

Fig. 2.—SECTIONAL VIEW OF INJECTOR.

Fig. 3.—MODE OF CONNECTING PENBERTHY AUTOMATIC INJECTOR.

20 to 25 feet, and force hot water at 100° to 120° F. Within a range of 40 to 50 pounds pressure it is only necessary to operate the steam valve, so that once started under most circumstances, it is a one-valve injector.

Fig. 3 shows the method of connecting the injector. In this *A* is the boiler, *B* injector, *C* steam pipe, *D* globe valve, *E* delivery pipe, *F* check valve, *G* globe valve, *H* globe valve, *I* suction or water pipe, *J* water, *K* mode of connection in cases where top or dome of boiler cannot be tapped, *L* pipe to tank when water flows to injector. The globe valve *G* is not necessary, but should be placed next to the boiler in case of accident to the check valve *F*, and always remains open. All other valves are necessary. The length of pipe and condition will vary according to circumstances, but the mode of connection must always be the same.

To clean the injector the tube nut connecting the delivery pipe *E* is removed, and the jet will drop out into the hand, and when steam is turned on all dirt will be removed. To operate this injector the following directions are given by Parke & Lacy, 21 Fremont street, San Fran-

cisco, this Pacific Coast agents: Open the valve *H* in the suction pipe full, also the valve *D* in the steam pipe, and in a short time the water will appear at overflow. Then gradually close the valve *H* in the suction pipe *I*, and the water will stop at overflow when the injector will be working. As steam rises, the valve *H* can be gradually opened until the injector takes all the water. Where this variation of steam used is not over 40 pounds after the valve *H* is once set, it is only necessary to turn steam on and off and the injector will start automatically. A leak at the overflow is caused by too much or not enough water, or a leak in the suction pipe. When a long lift is used, it takes several minutes to bring the water to overflow.

Now the borax fields here and in Nevada are extensively worked. Prices in 1872 were 32 cents per pound; now they are 5½ and 6½ cents. The borax now worked occurs mainly as a borate of lime, or as an efflorescence on the surface. The soil is leached in large vats, and the borax purified by settling and subsequent slow crystallization. The borax market is now controlled by San Francisco merchants.

Roasting and Leaching of Silver Ores.

Notes of the Practice at Las Yedras, Sinaloa, Mexico.

NUMBER 3.

[Written for the Press by CARL A. SCHENCK.]

The operations in the leaching department separate themselves into four distinct groups:

1. The leaching of the roasted ore in the leaching vats.
2. The precipitation of the silver-sulphids.
3. The return of the regenerated hypo to the elevated and storage vat.
4. The work of the cleanup, including the transfer of the precipitates to draining vats, roasting of the same and preparation for shipment.

Construction of the Vats.

Of the ten vats put up for dissolving the silver, five are round, built of wood, and the other five rectangular, constructed of masonry, with a capacity of about 30 tons to a vat of each kind. The diameter of the round vats is 16 feet and the depth six feet, of which six inches are used for the rock bottom; the inside dimensions of the rectangular vats are about 15½x17x5½, which latter is the depth to the surface of the rock bottom. A framework of wood and iron rods—the rods being laid in the walls, and passing from upright to upright, being also provided with nuts for adjustment—strengthens and stiffens the brickwork of the rectangular vats. The thickness of the proper wall is equal to two bricks in length, so that it is made up of two shells, each one brick length in thickness and the inner shell put up close to the outer, a thin plaster of brickdust coated over with tar intervening only between the two. To the surface of the inner shell the same plaster and coating of tar is applied, upon which follows a covering of half-inch boards, with the joints running up and down. Planks, held in position by nuts which are screwed to the ends of perpendicular rods laid in the masonry, cover the top of the walls of this square inclosure. The brick floor is made impervious in a similar way, and the whole structure rests solidly on the natural rock foundation. The wooden vats are built of two-inch staves cut out of the native pine, which is of a very inferior quality. They are also coated on the inside with tar. For the purpose of filtering, a rock bottom about six inches thick is used, which, in comparison to a properly constructed false bottom, does not answer so well as the latter, which point will be referred to further on.

Leaching of the Roasted Ore.

By means of a system of tracks, consisting of main tracks, turntables and side tracks, the ore is conveyed in cars from the roasters, charged into the vats and the tailings wheeled to the dump pile. From the main pipes for water and hypo, running parallel to the line of vats, are connections with proper valves, so that each vat has its own hypo connection, and between each pair of vats a short pipe runs off from the water main. By coupling rubber hose to these short connections, one or two streams of water can be turned on and led into any one vat, whenever it is necessary. Solutions are drawn from the bottom by means of two-inch rubber pipes, which, when not in use, are hung up; though this diameter appears rather large, experience has shown that it is not too large for quick filtration, the same amount of hypo running in at the top. The outflow can be, moreover, regulated by clamps, so that the surface of the ore under treatment may always be well covered with hypo, even in case of a diminished supply; for instance, by drawing off more than two streams from the main hypo pipe at a time.

Of the round vats, only one, No. 2, is used at present; but the rectangular brick tanks 4, 5, 6, 7 and 8 are all in use and answer the purpose well.

[TO BE CONTINUED.]

Appreciative.

THE MINING AND SCIENTIFIC PRESS of San Francisco has entered Volume LIV. We think that paper fills the bill as a promoter of the great industry of mining. That paper covers the entire field. For our use we don't ask a better mining paper than the MINING AND SCIENTIFIC PRESS of San Francisco.—*Foothill Tidings*.

W. J. Freeman, agent for the San Francisco MINING AND SCIENTIFIC PRESS, was in town Tuesday last in the interest of that most excellent periodical.—*North San Juan Times*.

MECHANICAL PROGRESS.

The Principle of the Injector.

The *Journal of the Brotherhood of Locomotive Engineers* contains several answers to the question, "Why does an injector work?" The following contributions are specimens of tolerably correct and wholly erroneous solutions of a problem which for many years puzzled the engineering world:

"All injectors work mainly on the same principle. The resistance of pressure in boiler, weight of check valve and friction of pipes are overcome by the momentum imparted to the water by the steam at the point where the steam suction and discharge pipes combine. In order to attain the necessary velocity, the water must come through the suction pipe cold enough to condense the steam immediately when they come in contact with each other, thereby giving the steam a solid body of water to act on, and allowing it to exert all its force in one direction. If the water be so hot as to not immediately condense the steam, then the steam would occupy space in the discharge pipe, and would naturally exert a pressure in both directions, thereby breaking the stream, and would force the water back through the suction pipe, even though the water is cold. If the quantity supplied is not sufficient to condense the steam, the injector will not work."

Another contributor says:

"Now as to my belief as to what makes the injector operate, I think in no way can I explain it better then by comparing it to a shot-gun (now don't laugh, but read and see if it doesn't strike you that way; I mean the idea, not the gun), in which steam is the powder and water the shot. If we shoot a gun loaded simply with powder, the smoke of the discharge passes but a little way from the muzzle; but put in a few shot and they are propelled hundreds of feet; place a board near and they will go right through it. The secret of their penetrating force is their weight. 'The force of the momentum of any body is in proportion to its weight.' See? And that explains why the injector does not work hot water. The nearer to steam that water becomes, the lighter it is, until it is so light that it will not have weight enough to give it the force necessary to lift the check valve that is fired against by the powder steam."

"It is the momentum of the water fired out of the nozzle of the steam-jet that gives the penetrating power, and the more solid the water is, the more power it will have with the same velocity; the nearer steam the water is, the less will be its force, and consequently the injector will not work hot water, or water much above 150°."

It need not be said that the reasoning of the second contributor is wholly erroneous. The fact that steam from a boiler will not only re-enter that boiler after passing through several pipes, contracted passages and valves, but will carry a considerable body of water with it, will always be an apparent paradox, and it is not surprising that locomotive engineers should be a little uncertain as to the exact explanation.

The action of an injector may, however, be easily explained. High-pressure steam moves with an immense velocity, steam of 140 pounds pressure above the atmosphere being capable of going into the atmosphere at the rate of 1917 feet per second, or 1302 miles per hour, which is sufficient to impart a moderate velocity to a body heavier than itself. In an injector that body is the feed-water. Unless, however, the feed can condense the steam, the injector will not work. The reason is apparently purely mechanical, as the steam, being bulky and highly elastic, can have no appreciable effect in driving the particles of water in any given direction. When, however, the steam is condensed into an unelastic jet of water, still moving at a great velocity, it forces the feed-water before it into the boiler. This is easily illustrated by supposing that an attempt were made to propel a ship by a jet of compressed air from the stern. The air would simply rise in a mass of foam to the surface, and the energy in the air would be wasted in spray instead of propelling the ship. A jet of water, however, directed astern, would have no tendency to rise, as there would be no difference of specific gravity, and it would therefore propel the ship by reacting against the mass of water.

It is somewhat singular that there has been so little theoretical discussion of the injector, accompanied by formulae giving the quantities of water of a given temperature which should be delivered per hour by an injector of a given size, working with a given pressure of steam. Some empirical formulae exist, based on the result of experiments, but such as are based on pure reasoning from the recognized laws of physics seem to be very little known.—*Railroad Gazette*.

OLD HORSESHOES—HOW THEY BECOME VALUABLE.—The wrought iron, of which horse-shoes are made, owing to the constant hammering on pavements, stones, and hard roads, together with the animal heat to which they are constantly subjected, gradually assumes the hardness of steel, combined with great malleability and elasticity—qualities which eminently fit them for being manufactured into fine articles of cutlery, such as knives and sword blades. Horseshoes in this country, especially, are always separated from the promiscuous mass of iron scrap and reserved for special uses. They

are considered much superior in value to ordinary iron. It is said that the peculiar value of old horseshoes does not seem to be appreciated in Germany and other European countries, and that John Chinaman, having learned the secret of their value, is now largely engaged in buying them up and shipping them from Germany to China. A Berlin firm recently shipped, to Chinese order, between 3000 and 4000 tons of this cast-off equine wear. They will be used in the manufacture of superior Chinese cutlery.

IS IT A CURSE?—In 1840, says the *Age of Steel*, when there was no wood-working machinery worth mentioning in use, one person out of every thousand was a cabinet-maker or upholsterer. In the 10 years following, wood-working machinery came largely into use. Now, if machinery is a curse to the mechanic, it must be because it deprives him of work or reduces his wages. But neither of these conditions followed the introduction of machinery; on the contrary, in 1850, in a population of 23,191,000, there were 23,522 furniture-makers, or one to every 985 people; and annual earnings had advanced 20 per cent. In 1860 the proportion of furniture-makers to population was the same as in 1850, but during the 10 years wages had advanced so that whereas the mechanic (averaging all classes, including children) in 1850 earned \$298 per year, in 1860 he was earning \$327. Bringing the comparison down to the year 1882, the number of operatives had increased to one in 657 of population, and the average annual earnings of each operative had increased to \$434.70. Of food products, a dollar will purchase as much now as it would in 1840, and a very much greater quantity of manufactured products; so the difference in annual earnings between 1840 and the present, considered relatively to its value—that is, its purchasing power—is enormous. It therefore appears that, as the use of machines has multiplied, the demand for operatives in the furniture industries has increased, and the annual wages have also increased about three-fourths.

FLUE DUST.—The importance of close attention to details and to a full understanding of the qualities of the material to be treated is fully shown in the item of flue dust alone, in which a large waste, often unknown and unaccounted for, takes place. When appliances have been used, after attention was called to years of loss and wastefulness in this direction, the results are astonishing. Recently the furnaces of the Anaconda mines, of Montana, were started up on flue dust, of which 600 tons had been collected, carrying a large percentage of valuable material. Upon this topic the *Leadville Herald Democrat* states that an analysis of many thousands of tons of flue dust showed its composition in that locality to be as follows: Silver, from 20 to 37 oz. per ton; lead, from 20 to 30 oz. per ton; gold, from a trace to $\frac{1}{2}$ of an oz. per ton; zinc, from $\frac{1}{2}$ to 9 per cent; arsenic, from a trace to $\frac{1}{2}$ per cent; silica, from 18 per cent to 27 per cent, and iron, from 11 per cent to 25 per cent. These facts are sufficient to show one of the sources of large loss in ore treatment.

CASTING IRON OR STEEL UPON BRASS.—One of the latest inventions or discoveries in metallurgy is the casting of iron or steel on brass. It is a thing that has often been sought to accomplish, but until recently without success. Experiments were made lately in Boston. The brass core, or whatever it may be, is first cast in the usual way, and is then molded in conjunction with the pattern, and when the latter is removed it is allowed to remain in the flask, and the melted iron poured over it. This iron is prepared by a flux for ready amalgamation with the brass, and when the compound casting is taken from the sand it is found to be a complete and well-connected piece. The union of the two metals is perfect, and they can be separated by melting the brass which runs at lower temperature than iron from its backing. For bearings for car axles and other things that now require solid and thick brass castings, costing quite heavily by the pound, the compound bearings, being more than three-quarters cheap iron, would form a cheap and efficient substitute.

IRON AND STEEL TOOLS.—It is difficult, says a Belgian journal, to distinguish between iron and steel tools. They have the same polish and workmanship; use will commonly show the difference. To make the distinction quickly, place the tool upon a stone and drop upon it some diluted nitric acid (four parts of water to one of acid). If the tool remains clean, it is of iron; if of steel, it will show a black spot where touched with the acid. These spots can be easily rubbed off.

TO SOFTEN COPPER WIRE.—Copper or brass wire larger than No. 18 is hard to bend. By heating to redness and plunging into cold water both these metals will become much softened. In making joints in wires before soldering, if they are softened in this way and cleaned, excellent contact apart from the solder can be obtained.

THERE are but two rolling mills in the State which turn out steel rails. These are the Pacific Rolling Mill, in this city, and the Central Pacific Railroad Rolling Mill, at Sacramento. The Judson Rolling Mill Company, whose works are at Oakland, turn out no steel rails, confining its attention to agricultural implements and other hardware.

SCIENTIFIC PROGRESS.

Subterranean Atmosphere.

Mr. R. Norton communicates to the *Scientific American* some very interesting facts in regard to subterranean atmosphere, as follows:

The largest volume of subterranean atmosphere with which we are acquainted is found in Mammoth Cave, Ky. This cave, or rather system of caves, is very extensive, greatly exceeding the other two notable caverns in our country—the Luray of Virginia and the Wyandott of Southern Indiana. The passageways of Mammoth Cave have a combined length of over 150 miles, and their area covers hundreds of acres. It is estimated that the entire volume of atmosphere thus inclosed exceeds 12,000,000 cubic yards. In this underground world the ordinary atmospheric changes are unknown, summer and winter are unknown, and the heat of the sun never reaches its unbroken night.

Like all our larger caverns, the temperature is alike at all times and seasons. In the summer there is a brisk outward current having a temperature of 53° to 54°. This current is doubtless fed by certain leakages of air which filter through the sinkholes, which discharge their moisture at certain points in the cave system.

In the winter there is a current of air setting inward. This is not perceived at a distance of one-fourth of a mile from the entrance. It nevertheless depresses the thermometer a few degrees, and its effect upon the humidity of the air is evident at the distance of three-fourths of a mile.

For the first time hygrometric observations have been carefully made as to this unique body of atmosphere. The dryness of the air has often been noticed, and the resultant miter heads were esteemed a matter of national importance during the war of 1812.

In the "Gothic Gallery," several miles underground, visitors have been wont to deposit their cards, and these cards have remained for years, fresh as new, save where moist finger prints have left behind them the germs of mold. The ground is seemingly dusty, but still the dust, if stirred, will not rise in the air, nor soil a polished shoe. In these portions of the cave, which seemed destitute of moisture, the wet and dry bulbs of the hygrometer showed the same figure, the variations seldom exceeding one-fourth to one-half a degree. The humidity ranged between 96 and saturation. With the thermometer at 54°, the wet bulb would range between 53° and 54°, and the dew point would be between 53.1-10° and 53.7-10°. The singular fact was noted that the same temperature prevailed at the roof as upon the floor of the cave; and where differences of 200 to 300 feet of elevation occurred, the thermometer would be depressed one or two degrees at the higher as compared with the lower altitude. The humidity would, however, remain a constant quantity. This can be accounted for only on the supposition that the supply of air, slowly admitted from above, is chilled by the absorption of moisture during the first stages of its descent, and becomes slowly warmed before completing its full descent of 300 feet. Mold is rarely seen in the cave, but wherever it occurs a snowy whiteness and luxuriance of growth are noted.

One avenue is devoted, with excellent success, to the growth of mushrooms, and no doubt such an atmosphere might have an industrial value for other purposes.

Several consumptives once tried to live, and get well, in the cave. But the result was disastrous. The lack of light was, no doubt, one reason of this; but the hygrometric condition of the air, of which nothing was then known, by greatly retarding healthy perspiration, doubtless hastened the fatal result.

Photographic Astronomy.

Prof. Pickering, of Harvard University, recently read a very interesting paper on photographic astronomy before the Boston Institute of Technology. He alluded briefly to the history of this important branch of that science. Prof. Bond, of Harvard, was the first investigator in this interesting field. His son, Prof. Geo. F. Bond, and Prof. Winlock afterward took up and carried on the work at Harvard. Prof. Pickering is now in charge.

The use of photography in the study of astronomy is comparatively a recent innovation, but it is making steady and rapid strides in the advancement of the science, particularly in the study of the stars and nebulae. Stars are now photographed which cannot possibly be seen with the naked eye, and some have been discovered, by photographic means, whose existence could not have been made known by the most powerful telescopes.

In photographing a fixed star, it is necessary, in order that the star may appear in the negative as a point only to have the telescope move with the same angular velocity as the earth. This motion is imparted by clockwork, driven and regulated by electricity, which is the most perfect clock movement which has been devised. When no clockwork is attached to the telescope the stars appear as so many lines instead of points.

An interesting use of this mode of photographing the stars has been made in causing the heavens to register themselves on the same plate by means of dots and dashes. This effect is produced by shutting off the light at inter-

vals. Many widely separated stars are thus photographed on the same plate, and the danger of mistaking one set or group for another is avoided.

When the clockwork is put in, all the light of the stars or "lines" becomes concentrated in points.

The professor referred to useful results which had been obtained by photographing Jupiter's satellites; also in the recently discovered nebulous cluster in the group of the Pleiades and the nebula of Orion.

In the study of the spectra of the stars, photography has proven a most important aid. By this means the group of the Pleiades has been conclusively proven to be composed of the same or similar material; the few stars in the vicinity which showed a different composition, being the very ones which have been decided by heliometer measurements to be separate from the group. By the same means remarkable varieties in the spectra of the different stars, hitherto not known, have been found to exist.

The late Prof. Draper gave much time to this study, and his widow has presented to the observatory his fine telescope specially adapted to such work. In getting the spectra of heavenly bodies by this instrument, four immense prisms are used to give the proper dispersion, and it is expected as this branch of the science advances that the investigation now made possible will disclose not only the composition but possibly the temperature of the scintillating spheres. The fact whether certain stars are approaching or receding from the earth, will, it is expected, be made more conclusive and such observations be also much extended. Many other important revelations are looked for by the further study and exercise of this new astronomical aid. The paper of the professor was listened to with great interest by the very intellectual audience present.

It may be remarked in this connection that much may be expected in this direction from the Lick Observatory in this State, when work there is fully under way. The exceptionally clear atmosphere on Mount Hamilton, far exceeding in that particular any other observatory in the world, cannot fail to give greatly added efficiency to the photographic study of the myriad of other worlds above and about us.

METEOR SHOWERS.—Prof. Richard A. Proctor maintains that most of the meteor streams with which the earth comes in contact are derived from the earth itself; that is, thrown off by volcanic action at a time when the internal forces of our planet were sufficiently active to give the initial velocity, some 12 miles a second, requisite to carry them beyond the earth's attraction. Comets, which he regards as the parents of the meteor streams, he thinks may have originated outside our solar system. Most of the comets whose orbits belong to our system, he thinks originated in the larger planets. The sun is now, perhaps, giving birth frequently to comets which probably pass beyond the limits of its attraction.

A SENSITIVE COMPASS.—The *Orizaba*, of New York, is a new steamer. The compasses are Sir William Thompson's patent. When swinging the ship, the reading of the bearings by one of the officers was always different from that by other officers. This led to a wordy contention, the officer maintaining that his reading was correct. The difference was at last discovered to be due to that officer having on a steel truss. These compasses are so sensitive that they are affected by such very minute disturbing influences. The officer had to go on shore and provide himself with a truss constructed free of iron.

DISCOLORATION OF GLASS.—The discoloration of glass by the action of sunlight is very decided. It is found that nearly every kind of glass, especially that containing manganese, is liable to change of color by the action of sunlight; but the glass can be restored to its original color by heat. In our cathedral windows the glass is not of its original colors, but these colors can be brought back again by heat.

THE COLOR OF THE "BUTTERCUP."—The peculiar varnish-like luster of the petals of the buttercup is attributed by Dr. Mobius, who has recently been investigating it, to a highly refractive yellow oil existing in the epidermal cells, increased by the fact that the layer of cells of the mesophyll is densely filled with minute starch grains.

A LARGE MULLIN.—*La Nature* has recently figured a remarkable specimen of the common mullin (*Verbascum thapsus*), which was found growing in a garden near Rouen, and the dimensions of which were as follows: height, 10 feet 1 inch; raceme of flowers, 5½ feet in length; leaves on an average, 1 foot wide by 2 feet in length.

THE MOUND-BUILDERS.—Recent explorations prove that the ancient mound-building inhabitants of America extended their works northward beyond the Red river of the North. Along this river and Lake Winnipeg were found mounds identical in structure with the famous ones of the Ohio and Mississippi valleys.

SKELETON OF A WHALE ON A MOUNTAIN-TOP.—The petrified skeleton of a whale over 30 feet long has been discovered by an officer of the Coast Survey on a range of mountains in Monterey county, Cal., over 3300 feet above the sea level.

USEFUL INFORMATION.

COMPOSITION TO ATTRACT DISSOLVED CRYSTALS.
—One of the greatest objections to all processes heretofore used for the purpose of crystallizing the surface of fancy goods has been that the crystals soon become loose and drop off, and on this account crystallized decoration has not been introduced in as great a degree as it would have been if some method had been discovered for holding the crystals firmly in position. Mr. William Kornacher, of Scranton, Pa., has lately been experimenting with various materials for quickly producing crystallization for decorative purposes, and has discovered a new process by which crystals are more quickly and perfectly formed and are more firmly attached than by any method yet introduced. This discovery consists in the use of a base which can be molded into any desired shape, and which is so treated that when immersed in a crystallizing solution, the crystals will form very rapidly and make a positive connection with the base, and thus insure a stability that will fulfill all the requirements of the trade, in articles that are decorated in this manner. This invention is of importance, since this method of covering the surface of fancy articles is very beautiful. The crystals can be made of any desired size, and if the article to be treated is made of a number of pieces, each having crystals of a different color, effects can be produced that cannot be attained in any other manner.

HOW HORSES REST is explained by the New York Mail and Express as follows: "Horses can get some rest standing," said an old trainer, recently, "provided the position is reasonably easy, but no full rest except when recumbent. It is known of some horses that they never lie down in the stall, though when in pastures they take their rest habitually in a recumbent position. It is well to consider whether the habit has not been forced upon the horse by some circumstances connected with the stall he was compelled to occupy, in that he had a muddy earth floor or one made of dilapidated plank, uncomfortable and offensive to the horse that had been accustomed to select his own bed in the pasture. If the horse can have the privilege of selecting his own position for resting on his feet, he can sleep standing; but while his muscles may be to a certain degree relaxed, and get rest in that position, what can be said of the hearings at the joints? Without relief through the recumbent position, the joint surfaces are forced continuously to bear a weight varying from 1000 to 1800 pounds. This must act unfavorably, especially upon the complicated structures within the hoofs, which Nature intended should have periods of rest each day."

FOR CLEANSING AND WHITENING INSIDE WALLS.—Ordinary whitening is not altogether the best thing to put upon inside walls. A mixture that has a whitening and sweetening effect and which is also cheap and durable, may be made as follows: To 15 pounds of the best whiting, thinned down to proper consistency in cold water, add one pound of clear white glue dissolved in warm water. Apply cold, except in cold weather, when the walls are all cold, in which case it is well enough to use some warm water, enough to keep the mixture thin so that it will spread easily. Dissolve the glue, first cover it with cold water, and let it stand and soak until it becomes soft; then pour off the cold water and add hot water; it will then readily dissolve. For very fine work, it is recommended to use zinc white instead of whiting. Half an ounce of ultramarine blue added to the above makes a clearer white. The mixture may be colored, if desired, to suit before putting in the glue.

DRESS COATS AND VESTS COMBINED.—A recent London paper says: Everybody who has to get into a dress coat knows the difficulty of preventing it from swinging away at the waist or collar, or slipping off the shoulders. These apparently irremediable defects—irremediable because the coat cannot be buttoned—have, I find, been completely overcome by well-known coat tailors of Bedford street, Strand, by attaching the waistcoat to the coat in a very simple manner. Thus, when the vest is buttoned the coat for all practical purposes is also buttoned. Moreover, the latter then clings to the figure as closely as a frock coat and remains in the same position, imparting an appearance of smartness about the waist especially, which in a dress suit is really of the utmost importance to the wearer. I have no doubt that the dress coat and vest combined will be very popular during the present season.

A CONVENIENT MEASUREMENT.—To find the capacity of a tub having the shape of a truncated cone, add to the square of the larger radius the square of the smaller radius, and the product of the two radii; multiply the sum by the height and the product by 7.8, which will give the contents in gallons.

CRUSHING RESISTANCE OF BRICK.—It is said hard burned brick walls will resist a pressure of 150 pounds per square inch, and can therefore be built 1600 feet high. If one-third Portland cement is added to the mortar, the same wall could be built 2700 feet high.

THE SEVERN TUNNEL.—The total length of the Severn tunnel is 4 miles 624 yards; the St

Gothard tunnel is 9½ miles; Mont Cenis tunnel, 7½ miles; Arlberg tunnel (Austria), 6½ miles; the Hoosac tunnel, in Massachusetts, 4½ miles; the Standage tunnel, on the London & Northwestern, is 3 miles long, and the Box tunnel rather less. But the special feature of the Severn tunnel lies in the fact that 2½ miles of it have been constructed from 45 feet to 100 feet below the bed of a rapidly-flowing tidal estuary, offering engineering difficulties which make it the most remarkable tunnel in the world.

COPPER COVERED WITH STEEL.—A telegraph wire is now being brought out in England in which the steel is made to surround the copper. The wire is said to be drawn from compound metal, consisting of a hollow ingot of steel filled with copper.

OILCLOTH may be improved in appearance by rubbing it with a mixture of a half-ounce of kerosene in a saucerful of turpentine. Set this in a warm place until they can be thoroughly mixed. Apply with a flannel cloth, and then rub with a dry flannel.

WATER IN LEAD PIPES.—It has been clearly established that lead pipes are little affected by water if constantly filled, but readily affected if alternately filled and emptied. Unless always full they are not fit for carrying drinking water.

RAILROAD GAUGE IN THE SOUTH.—The gauge of all the railroads in the South is to be changed this spring to the standard—4 feet 8½ inches. The gauge of most of the Southern roads was changed to the standard width about a year ago.

TO SOFTEN WROUGHT IRON, first heat it until it becomes a low red color, and cool it in soft soap. Reheat it to a low red as before, and let it cool in limo. It is said that this treatment makes the iron very soft.

PAPER FROM PALMETTO.—A ton of palmetto is to be sent north from Sanford, Fla., to be manufactured into paper as a test of that material for printing paper.

PATENT LEATHER.—To prevent patent leather from cracking, always warm the leather before inserting the foot in the shoes. Heat renders patent leather soft and pliable.

A HANDY PEN-WIPER.—A good pen-wiper for steel pens is a piece of raw potato. It removes the ink crust and causes a smooth flow of ink.

SAN FRANCISCO is the ninth city of the Union in point of population.

GOOD HEALTH.

Lanolin—A New Oil.

Lanolin is the name given to a new fatty substance obtained from the alkaline water-wastings of wool, and very highly recommended as a base for various medicated salves and ointments used in treating cutaneous eruptions and other external as well as internal disorders. It consists of varying proportions of cholesterol and fat acids, with which is incorporated a certain percentage of water, which it readily absorbs, thus forming a smooth, white, unctuous mass. As some of our professional readers will be interested to know how it is prepared, we are able to present the following formula, as contained in a late issue of the *Western Drug-gist*:

"The wool-washings are first passed through a fine sieve to free them from mechanical impurities, and then through a convenient quantity of cut straw or sawdust; the solution is then treated with magnesium sulphate, and the resulting magnesium soap, containing also the cholesterol, is collected, well washed with water, then drained and allowed to dry by exposure to air. It is then treated with sufficient diluted hydrochloric acid to decompose the soap; a large excess of hydrochloric acid should be avoided, but sufficient added until a slight excess of acid is indicated, which is afterward removed in the process. The resulting fatty scum, consisting of fatty acids and cholesterol, is drained and treated with petroleum benzine in a closed vessel, slightly warmed to about 85° F. to aid solution, and then filtered through flannel in a closed filter press. The petroleum benzine is then driven off by evaporation or distillation, and to remove any remaining traces of hydrochloric acid, the residue is treated with from one-tenth to one-fourth per cent of carbonate of magnesia, rubbed up with water, the mixture being then well washed with fresh portions of water, until the water washings are no longer milky. It is then again melted, filtered, while hot, through flannel, and, when cold, water is incorporated, and the lanolin becomes white, hard and smooth."

The peculiar valuable quality of lanolin consists in this facility with which it penetrates the skin and is absorbed into the system. This peculiar characteristic makes it especially valuable as a carrier. There is no doubt but that gray ointments, and in fact all ointments, are much more efficient when prepared with lanolin. When used on mucous surfaces it never forms a scab.

THE VERTIGO OF THE KAJAK.—Mr. Hastrup, a physician of North Greenland, has observed a curious affection that attacks the Esquimaux.

Its name in the Esquimaux vernacular is the equivalent of our term "boat fright," but Danish physicians call it "Svimmelhed i Kajak," or vertigo of the kajak. The disorder is described as follows: An Esquimaux, while sailing in his kajak upon a perfectly calm, smooth sea, is suddenly seized with a feeling that his boat is tipping to one side. His jumps to the other side to preserve the equilibrium, but this only makes matters worse, and he abandons himself to anxious and even frenzied attempts to keep the boat from tipping. He can no longer fish, and his trouble does not cease until he gets in sight of shore or of another boat. These attacks are not accompanied or preceded by any malaise or nausea. There does not appear to be any true vertiginous sensations, but there is rather an hallucination of the sense of equilibrium. The disorder attacks the Esquimaux when they are apparently in full health, and it is not accompanied with headaches, tinnitus, palpitations, convulsions or paralysis. It may last a lifetime, or go away as it comes, quite suddenly. It is a great misfortune to the patient, since he can no longer fish, and is practically an unproductive member of society. The disease has been attributed to the excessive use of coffee and tobacco, but Mr. Hastrup has observed it in men who used neither of these substances.

DUST AND DUSTING.—At all times unwholesome, when dampness gets hold of dust it ferments, decays and becomes positively poisonous; and this must needs happen on any rainy day, on foggy mornings, on dewy nights, and at that season of the year when dampness seems to penetrate the house, and it is not yet time to light the fires that might dry it out or hinder it. The rooms of a dwelling-house, then, cannot be too thoroughly swept and dusted off, in order that the least possible deposit of dust may be left in them. Many housewives think that the less the dust is stirred in sweeping, the better the work is done, and tea leaves and wet grass or moistened meal is thrown about the floor in order to gather the dust and prevent it from rising. But people giving the matter philosophical attention have come to the conclusion that precisely the opposite course is the fit and proper one; that a good stirring up and then a good blowing out is what the dust needs, and that with a wind blowing unobstructedly through the room as thoroughly as a wind can be made to blow.—*Harper's Bazar.*

WANT OF COMPANIONSHIP AND ILL HEALTH.—There is a human hunger which we are all apt to overlook in our inventories of hygienic agencies. Hard-working women on lonely farms and in isolated villages, and frequently women in large cities, too, often find themselves growing irritable and nervous, and even troubled with religious doubts, in spite of their fervent prayers. They do not need tonics or moral discipline. They need contact with new minds, new ideas, new scenes, just as their lungs, after using up all the oxygen in a close room, need the air out of doors. Girls are too apt voluntarily to force themselves into this state; disappointed in their natural longings for a congenial companion, they resolve to live within their own resources, which are not sufficient to keep off famine. "Only a god or a brute can dwell in solitude," says a wise old German. Every human being needs congenial companionship for health's sake as well as for happiness.

SLEEP A PREVENTIVE OF HEADACHE.—A scientific writer says: Sleep, if taken at the right moment, will prevent an attack of nervous headache. If the subjects of such headache will watch the symptoms of its coming, they can notice that it begins with a feeling of weariness or heaviness. This is the time a sleep of an hour, or even two, as nature guides, will effectually prevent the headache. If not taken just then it will be too late, for, after the attack is fairly under way, it is impossible to get sleep till far into the night, perhaps. It is so common in these days for doctors to forbid having their patients waked to take medicine if they are asleep when the hour comes round, that the people have learned the lesson pretty well, and they generally know that sleep is better for the sick than medicine. But it is not so well known that sleep is a wonderful preventive of disease—better than tonic regulators and stimulants.

DIPHTHERIA AND MANURE HEAPS.—M. Ferraud, *Lyon Medical*, traces the relation between manure heaps and rural epidemics of diphtheria. On one occasion the disease appeared the day following a general street cleaning. He argues that manure should be kept in closed wells of stone, glazed with bitumen, so constructed that the fluids may filter away from the solid matter.

DANGER IN NICKEL-PLATED WARE.—An order has been issued in Lower Austria forbidding manufacturers and tradesmen to sell nickel-plated cooking vessels. It is stated that vinegar and other acid substances dissolve nickel; and that this, in portions of one-seventh of a grain, causes vomiting, and is even more poisonous than copper.

DEATHS FROM BEING STRUCK BY FALLING METEORS.—Prof. Shepard, of New Haven, makes a statement which will surprise most persons. He says: "There have been several instances of deaths occasioned by meteoric stones. Two monks in different places were thus killed in Italy, and two sailors on shipboard in Sweden."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MINING AND AGRICULTURE.—*Cor. Amador Sentinel*, Jan. 5: Our resources are both mineral and agricultural, the former having quadrupled in 10 years and the acreage under cultivation having more than doubled in two years. The ready cash market for all the farmers have to sell enables them to improve their land, which should bring about a hearty co-operation between miners and farmers, though at present the ranchers are inclined to work to the detriment of the miners. They have secured their land from the Government by patent and refuse to allow the miners to prospect. This land along the "mother lode" is better adapted for mining than agriculture, and hence the dissatisfaction between miners and farmers, which in the interest of all parties should be speedily compromised.

MILLS.—*Amador Ledger*, Jan. 8: The 10-stamp mill at Quartz Mountain is kept running steadily. Heretofore, the trouble has been to save the sulphurets, which are very fine, and carry a large proportion of gold. The ore altogether is of low grade, and cannot be profitably worked unless the sulphurets can be saved. The present owners have added Fruc concentrators, which are giving good satisfaction, and it is believed that the huge mountain of quartz which has given to the vicinity the name of Quartz Mountain can be made to pay handsomely. The company talk of increasing the milling capacity to 60 or 80 stamps in the spring, as the ore body in sight is practically inexhaustible. The new 10-stamp mill erected by M. M. Culbert, on Rancheria creek, is idle for want of water. It is thought that the ore which is to supply this mill will yield at least seven dollars per ton in free gold. Three-stamp mill of the Olive mine at Drytown is expected to get in running order in a few days. They are now engaged in constructing a reservoir to store the water from the Pacific mill, and in cutting a ditch from this reservoir to Drytown. By this plan they will get free water. The ore is estimated at four or five dollars per ton. With free water and a large mill such low-grade rock, if easily mined, might be worked at a profit. We presume the present small mill is intended merely for testing purposes.

SUTTER CREEK.—The Mahoney mill and mine came to a standstill last week on account of Mr. Stewart wanting the water for the Lincoln mill. There is not sufficient water for both mills, and Mr. Stewart having the first right, the Mahoney had to hang up stamps. It will take from a month to six weeks for the Lincoln to crush the rock on hand, when the Mahoney will probably resume. Sam Smithers, formerly engaged in mining in this county, but who of late years has been superintending the Dry Gulch mine in Idaho, has arrived here to take charge of the Wildman, which is to be started up at once. John Trelogan, Sr., will be here in a few days, to act as general manager of the property. Tarr's mill has completed the contract for lumber for the 40-stamp addition to the Pacific mill. The last two loads of lumber were to be shipped to Plymouth this week.

Butte.

CONSOLIDATED GOLD CLANNEL MINE.—*Oroville Register*, Jan. 6: This mine was originally patented by Geo. North and Henry Turner, some two years ago, both of whom are experienced river miners. During one of their exploring and prospecting expeditions on the north fork of Feather river, they discovered that at one place—some eight miles above the mouth of the Big Bend tunnel—the river was diverted from its direct course, by a high point of serpentine rock, pursuing a course at right angles to its general direction, for a distance of 800 feet or more, where it was again turned immediately back upon itself, forming a perfect loop of more than 2000 feet in length. The last 1500 feet of this loop has for ages been the receptacle of a large portion of the gold that has been washed down this branch of the Feather river, and has accumulated with a large deposit of gravel and enormous boulders in that portion of the river, to such an extent that the lower part of this loop becomes an immense dam of auriferous gravel. This gravel deposit they endeavored to work by sinking holes therein, but the loose nature of the gravel permitting the inward flow of water so readily, prevented them from attaining to a greater depth than four feet, and at this depth it required constant bailing while prospecting, but in every instance they found very rich gold-bearing gravel. Feeling confident that there was from 25 to 35 feet of this auriferous, undisturbed gravel in the river bed at the loop, they have organized a joint-stock company, for the purpose of draining the loop. The necessary surveys have been made, and disclose the fact that there is a fall of 28 feet in the loop. The accumulated auriferous gravel is in the lower 200 feet. The survey further shows that a tunnel of 445 feet in length will take the water of the river from the head of the loop and deposit it at the foot of the loop, draining the whole river bed for that distance (2000 feet), and as much further down as it should be deemed expedient to carry the water of a flume along the river bank. In conversation with T. W. Reese, C. E., who made the surveys, and who also made the first or preliminary surveys for the Big Bend tunnel, he informs us that, in all his experience of 35 years in California, he has never seen so favorable a spot for the deposit and retaining of gold in a river bed. That in shape it more nearly resembles the old Cape Claim (from which \$1,000,000 was extracted in 57 days) than any place in a river he has ever seen.

Calaveras.

FROM MURPHY'S.—*Calaveras Prospect*, Jan. 8: Since the rains, mining has made rapid strides, and a good showing will be made in the near future as to bullion shipments, increased activity, etc. The Oro Plata mill and pulverizers have been running continuously day and night since they first started up, and the cleanup will prove the thoroughness of the able management. The Burleigh is now placed in position in the level of the Red Wing, another of the company's mines, and will be started in a week. This will give work to a number of unemployed miners. The Esmeralda's new mill will start up in eight or ten days. The mine presents a fine appearance and excellence of ore, and will give a good ac-

count of itself. The recent rains will doubtless start up the Cunliff & Driver mill again, aiding materially to swell the bullion product of this section. In short, the mining news of this whole region is good, and favorable for good results.

RICH SILVER ORE.—*Mountain Echo*, Jan. 5: Rich silver ore is being extracted from the Jones mine near the mouth of Carson creek, some three miles from this town. Mr. Dockstader, the superintendent, presented this office with a small piece of the ore the other day, which competent judges claim will assay \$1000 a ton in silver. Be that as it may, the ore is certainly immensely rich.

Inyo.

SAN CARLOS MINE.—*Independent*, Jan. 8: From time to time S. A. Densmore does a little work on the San Carlos mining claim above Independence station. Recently a shipment of 170 sacks of ore was made to the new works at Reno. The ore weighed 20,873 pounds and its value was 40 ounces silver per ton and 49 per cent lead; net value of the whole, \$429.97. In any other part of the State ore that would net to the owner over \$40 per ton would be mined vigorously. Here in Inyo county, mines like the San Carlos attract but little attention and are worked only by fits and starts. If we could borrow Edison for awhile and get him here to electrify miners, farmers, and all others into a little more animation, the county would go ahead more rapidly.

Nevada.

BOSS.—*North San Juan Times*, Jan. 2: The shaft in the Boss mine is now nearly 70 feet in depth. The rock to the depth of 60 feet was of the same quality and character as that found at the depth of 20 feet, but the rock below 60 feet is of a different grade of ore. It is, as one of the owners expressed it to us, "more quartz." Free gold is found in this as well as the other, and the owners of the mine feel that they have a bonanza. The width of the ledge at the present depth is not known, but as the shaft is over six feet wide it is known certainly that the width of the ledge exceeds six feet.

MINED FOR COPPER AND FOUND GOLD.—*Transcript*, Jan. 8: J. R. Nickerson, a farmer living on the Auburn road 14 miles below Grass Valley, a number of years ago sank a shaft on his land in hopes of finding a paying ledge of copper. Some pretty good ore was struck, but it did not abound in large enough quantities to afford encouragement for working. Lately he sank deeper in the hope of opening a bigger deposit, and the vein widened somewhat as it was descended on. He has discovered since beginning operations the second time that the rock is quite rich in gold, and he is now working the claim for that metal and getting good results.

CRUSHING.—*Foothill Tidings*, Jan. 5: A test crushing of two and one-half loads of rock from the W. Y. O. D. mine, just back of Kate Hayes' Hill, has been completed at Penhall's mill. The yield was nearly \$35 per load. This ledge is strong and well defined, lots of it in sight, is in picking ground, and of course Brockington & Co., the lessees, feel jubilant about it. At the State ledge, or Perrin mine, much deadwork has been done of late, to the end that the incline shaft might be rectified to better conform with the trend of the ledge. This work has been successfully completed and a splendid looking ledge is now revealed at the bottom of the shaft. Francis & Co. are lessees of this mine, and a crushing of rock will doubtless prove that their labor has not been in vain.

AN UNEXPECTED FIND.—*Foothill Tidings*, Jan. 6: On the 16th of December last, Frank Jones and Benny Penhall were working in Wolf creek, above the Crown Point mine, for the purpose of repairing a dam that turns the water for running the machinery at Penhall's quartz mill. A hole was dug in order to put in a supporting post, and in this hole a quartz ledge, 2½ feet thick, was struck, and free gold was seen in the rock. No croppings of this ledge could be seen. The ground around there is "made ground," or the surface is composed of dirt washed down on the flat. The services of Mr. Charles E. E. Uren, county surveyor, were secured, and the ground was surveyed and a location made for a mine. The locators are Frank Jones, Benny Penhall, Edward James and Samuel Henwood. The name given to the location is the Calumet. A drain for the ground is now being run, and when that is completed a shaft will be put down at some distance from the creek. The Calumet is in a respectable neighborhood, being between the Idaho and Crown Point mines. This find illustrates with force the advice we have often given to Grass Valley people, to wit: Never dig a hole in this district for any purpose whatever without looking carefully into that hole; for as apt as not a quartz ledge will be discovered at the bottom.

Placer.

A DRIFT TUNNEL MINE.—*Grass Valley Union*, Jan. 8: The Morning Star drift gravel mine near Iowa Hill is approaching near the point where regular drifting operations will be commenced. The driving of a bedrock tunnel into the claim has been going on for years, the progress being slow on account of the hard character of the rock. Because of this, a year or more ago an upraise was made from the tunnel into the gravel channel overhead, and then a drift run upon the course of the channel over 400 feet. The bedrock was found to pitch, and the drift being carried along on level grade, winzes were sunk at intervals to determine the quality of the gravel on the bedrock. The prospects were uniformly good, and from the last winze sunk very rich gravel was taken out, two small carloads yielding \$13 to the car. A number of pieces of coarse gold were taken out in the course of this plan of prospecting, but generally the gold was like melon seeds, as found in the blue cement, and almost appearing as if placed there by hand. These prospects were so encouraging that the company determined to drive the main tunnel ahead to bottom the channel. The distance to be run was about 500 feet, and for the past year this work has been diligently prosecuted until last Saturday, when the contract was finished, making total length of tunnel 2350 feet. An upraise was started on Monday of this week, and from the survey that has been made it is estimated that the raise will come into gravel in 12 feet near the winze where the gravel prospected so richly when the drift was run overhead, and it will only be a short time when the regular work of drifting and washing the gravel will be commenced, and there is every reason to believe that the claim will prove rich,

and as the company owns a large piece along the channel, it will take a long time to work it out. The Morning Star claim is owned mostly in Grass Valley, J. C. & E. Coleman being the principal owners. Capt. Frank Richards is also interested, and there may be others. Jacob H. Neff, of Colfax, is also an owner, and is superintendent of the mine.

BIG BLUE.—*Placer Republican*, Jan. 12: A company has started to work the Big Blue quartz mine at Secret Town below Gold Run, and the present prospects are very favorable.

AT FOREST HILL.—*Placer Herald*, Jan. 8: The Excelsior mine is having all its machinery removed from the bottom, and will close down when the removal is completed. It is rumored that a tunnel will be run soon.

Plumas.

GOOD QUARTZ.—*National*, Jan. 8: We are informed that Mr. Swan has just made a cleanup at his mine in Granite basin that averaged \$24 per ton. Good enough. We hope it will never pay less.

NUGGETS.—We were shown by Major Whitlock last Monday several ounces of coarse, washed gold taken from Grizzly creek, above Genesee valley. The pieces weighed from one to ten dollars, and there is certainly a very rich channel in the immediate neighborhood of where it was taken out.

San Bernardino.

LEACHING ORES.—*Calico Print*, Jan. 8: The leaching works owned by Edwards, Bahten & Co. are doing a good business. It is the intention of the company, we learn, to soon add to the works a rock crusher and motive power to run the same, and also build more tanks. They have an opportunity to do an immense business, for there are millions of tons of low-grade ore in the camp which cannot be profitably reduced except by the leaching process. The character of the Calico ores consists principally of chlorides, particularly adapted to leaching. The sulphides and other rebellious ores exist in the camp only in comparatively small quantities. The leaching works will be of great benefit to chlorides, who can utilize low-grade ore thrown on the waste dump, and realize from one dollar to five and six dollars per ton for rock that will not pay to haul to the quartz mill, which will considerably reduce the cost of mining, and turn into bullion a vast quantity of ore that has accumulated on the numerous dumps during the past five years. Already a stimulating effect is beginning to be felt throughout the camp, and mines are being worked that heretofore were considered of too low a grade to yield a paying profit. Undoubtedly the largest leaching works on the coast will be established here, and there is enough ore in sight to keep them in operation indefinitely. Old-time miners predict that there are better times ahead for Calico than she has ever seen in the past.

Shasta.

THE NEW REDUCTION WORKS.—*Republican Free Press*, Jan. 8: On Thursday last our local visited the new reduction works now being erected just below the gas works, and found Mr. Chick with some half-dozen men busy at work grading and laying a foundation for the furnace in a building erected for the purpose on the brow of the hill. On the bank of the creek will be the concentrating room, next above the pantroom, next the pulproom, and above all the furnace and rock-breaker, making a perfect fall all the way down, so that there need be no handling of the ore. The machinery is expected to-day, and active operations will be commenced. Mr. Chick had put up a small furnace and was engaged in sampling ore for customers, among them Messrs. Copeland & Co., which came out very promising, and they expect to put up works on their mine. De Forest's arastra, last Thursday, was employed crushing rock for an assay which had been sent all the way from the vicinity of Lake View, Oregon.

Sierra.

RESUMED.—*Sierra Tribune*, Jan. 8: Work has been resumed on the Golden Eagle ledge. The owner will erect in the spring a quartz mill for crushing the rich ore taken from this mine. The ledge is four feet in width, the formation being porphyry. A report comes to town that the Forest King mine at Gold Lake has suddenly widened out to ten feet; all excellent ore. Hope the boys will adjust all their differences and go ahead and make a pile out of this promising mine.

GOLD BLUFF MINE.—The Gold Bluff is situated about one mile above Downville on the North Yuba river, and near the county trail going to Poker Flat. It has been in operation for more than 20 years. A. Van Slyke, the owner, has for the past two years been running a lower tunnel to tap the ledge. Last week it was reported that he had struck the ledge, which turned out to be a stringer. There are six ledges that will be struck in this tunnel. Mr. Van Slyke is also owner of the Butcher Ranch mine, of which Mr. Casserly is superintendent.

HELENA AND ETHEL CONSOLIDATED.—We were shown some fine-looking quartz from this mine which, in appearance, closely resembles the Phoenix rock. This rock is adjacent to the Phoenix and is four feet in width, and lies between porphyry and slate, and carries free gold and iron sulphurets. The owners, Messrs. Mooney, Schlessinger and Littlejohn, will soon commence work in developing the mine. The indications are favorable for a valuable property.

A GOOD LOCATION.—The Marietta quartz lode, which was formerly the Le Compton, has been located by F. J. Stephenson and James Hammill. At a depth of 10 feet a four-foot ledge, showing free gold and iron sulphurets, has been uncovered. The ledge is adjoining and south of the Cleveland and northwest of the Calinas and Mercer. The location is favorable for a good and permanent ledge.

Trinity.

COARSE GOLD.—*Journal*, Jan. 8: Jake Hershberger was in from New River this week and showed us three or four ounces of coarse gold, among which were several five or six dollar pieces. He informs us that Rufe McDowell & Co. recently picked up a couple of 50-dollar nuggets in their Pony creek claim.

RICH ROCK.—Developments continue in the seam or lode recently discovered by Messrs. Tourtellotte, Smith & Bowers near Minersville. Following the seam, pockets are frequently met with containing bunches of quartz filled with gold. Unlike the pockets usually found, the quartz is not decayed, but firm, hard and live, and on being broken by the

hammer has to be torn apart, as the gold holds it together. The largest bunch found weighed 50 pounds and yielded \$1400, while the richest bunch was 12 pounds which produced in the mortar \$655. Verily this is richness.

BULLYCHOOP.—Under date of December 27th, a friend writes from Cleveland, Trinity county, that Mr. Hart, superintendent of the Cumberland Mining Company, returned from San Francisco on the 22d. While there he purchased new machinery for a 10-stamp mill, and a new boiler—the largest in Trinity county. Active preparations are going forward and all will be ready to put the machinery in place when it arrives. The company is running the old mill on very good rock, crushing from 12 to 14 tons every 24 hours.

Tuolumne.

WATER SCANT.—*Tuolumne Independent*, Jan. 8: The prospects for a late summer supply of water this year do not look encouraging. It is the early snowfall which packs down in the mountains that our ditches draw on as a base for a late water supply. The early snows freeze and pack and melt gradually in summer, while that which falls late melts rapidly and floods the country, and cannot be beld back. Thus far very little snow has fallen in the mountains, and the winter is half gone. Unless the mountain storms come very soon, the snow pack will be light and water for mining purposes will give out early next summer.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Jan. 8: The south drift on the 1300 level has been advanced 40 feet. East crosscut, 100 feet south of the shaft, has been advanced 15 feet. The last five feet of this drift is in good ore. On the 1200 level the north drift has been advanced 28 feet, and the south drift 26 feet. On the second station level the west drift has been extended and timbered 30 feet. The south drift on the 1300 level has now reached the Chollar north boundary, and an east and west crosscut started on the line. The south drift is being continued in Chollar ground.

CROWN POINT AND BELCHER.—Since the closing down of the Combination shaft the water has gradually raised, until it has risen to a depth of 18 inches in the 1700 station. This necessarily stops the extraction of ore there from the Crown Point and Belcher. A supply of ore is being extracted from the 1500, 1600 and 1400 levels; also from the 200, 300 and 400 levels. Considerable prospecting is being done in the upper and lower levels. About 270 tons of ore are being extracted daily from the two mines.

HAYWOOD.—The winze is now down 106 feet and continues to improve. Assays from the bottom of the winze average \$106, and from the face of the tunnel \$55.50. Indications are very favorable for the development of a fine body of rich ore. On account of not being able to get the rock crushed, the force has been somewhat reduced. Arrangements are being made to get more mill facilities, when the full force of men will be put on again.

SAVAGE.—No. 6 west crosscut on the 600 level shows about 12 feet of fair ore. The south drift on the 500 level is also in ore. No change worth reporting in the 800 level crosscuts. The Sutor tunnel level shows good milling ore. The new gallows frame at the old shaft is almost completed, and expects soon to hoist ore through that shaft. Ore is being taken out through the Sutor tunnel.

POTOSI.—The south winze is down 40 feet and looks the same as last week. South drift in Potosi is now in 54 feet, and the face looks as well as ever. Upraise from the southeast drift is up 50 feet, and is still in good ore. Operations are confined to the 250 level.

IOWA.—A and B tunnels have made good progress during the week. A, the upper tunnel, has cut several quartz feeders in the last 10 feet, giving assays from \$40 to \$85 in gold. The stratification of rock in this tunnel denotes near approach to front ledge.

YELLOW JACKET.—Everything is going on as usual. Extracting 170 tons of ore daily that is coming from the 1300 and 1400 levels. This ore is being crushed at the Brunswick mill. It is worked very successfully by the Golden Gate concentrators.

SCORPION.—The work of repairing the machinery and getting ready to start the shaft was resumed on January 1. Have gotten up steam, and are repairing the shaft. In a few days will be able to start opening the new level.

ALPHA AND EXCHEQUER.—Hoisting works about completed, and have started the engine. The guide is in, and the work of prospecting has been commenced.

IMPERIAL.—The work of repairing the shaft continues. The shaft serves as an excellent means for ventilating the Yellow Jacket mine.

BULLION.—The Ceresus shaft has been sunk to a depth of 200 feet. Stations are being opened on the east and west sides.

CHOLLAR.—The old Chollar shaft is cleaned out and repaired a distance of 360 feet.

BALTIMORE.—Still repairing shaft and making good progress.

Columbus District.

MOUNT DIABLO'S NEW MILL.—*Tuscarora Times-Review*, Jan. 8: The Mount Diablo Mill and Mining Co. having decided to build a mill at Sodaville, on the line of the railroad, some 20 miles from its mine, is pushing the work with vigor. The mill is to be of 10 stamps, with a plain cylinder roasting furnace, six pans and three settlers. The company expects to have the mill ready to crush ore before the 1st of April next. Through the use of its new mill the Mt. Diablo will save \$5 per ton on its ore and its output will be entirely free from interruptions. With the 1200 or 1500 tons of loose ore now in the mine and what there is in sight, this mill will be kept running a long time.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Jan. 8: During the past week ore shipments were made from the mines of the district to the two reduction works in town, as follows: To the Richmond works—Dunderberg mine, 48 tons; Eureka Star, 1 ton; Hoosac, 5 tons; Geddes & Bertrand, 19 tons; Williams, 18 tons; Silver Lick, 12 tons; Alexandria, 6 tons; Williamsburg,

12 tons, Eureka Consolidated works—Gen. Lee mine, 3 3/4 tons; Alexandria, 2 7/8 tons; Morey, 8 tons.

Gillis Mountain District.

A BIG LEDGE.—Walker Lake *Bulletin*, Jan. 12: Jim Merrigold is working hard on his big ledge in Gillis and has a marked improvement to show as the result of his labor. This is about the largest ledge in the county, and will some time be the source of wealth for a great many people.

Granite District.

STRIKE.—White Pine *News*, Jan. 8: Parties in from Cherry Creek inform us that a rich and important strike was made in the Pittsburg mine about ten days ago by Judge Doolin and Thomas Kenney. While doing annual assessment work they struck a body of ore that goes 100 ounces in silver and \$25 in gold. The size of the deposit had not yet been ascertained, but it bids fair to prove a large one. Granite District is showing up well for the limited amount of work done on it.

Hawthorne District.

THE LAPANTA.—Walker Lake *Bulletin*, Jan. 12: Rapid and good work is being done in the Lapanta, and the condition of the mine is hourly improving. Continued increase of the quantity of good ore in sight makes the property more valuable every day, and while none of us can claim any credit for the gold being there, nevertheless Esmeralda county people are proud of the gold mine.

THE VIRGINIA NO. ONE.—A new claim called Virginia No. One, situated about two miles north of the Burnhille, promises well. Messrs. W. G. Wilkison and C. E. Kennedy, the owners, have a man at work on it now, and have several tons of good ore on the dump. There is every probability that they will have a good mine, and Wilkison's and Kennedy's many friends are well pleased at their good luck.

ORE SHIPMENTS.—A large lot of Lapanta gold ore and a smaller lot of Hindley silver ore were shipped to Reno last Sunday. These shipments are but the forerunners of many, and, as each will put money into circulation, the general condition of business will steadily improve.

Mount Cory District.

THE MOUNT CORY.—Walker Lake *Bulletin*, Jan. 12: The visit of Geo. R. Wells, president of the company, was made pleasant both by the complete arrangements for the comfort of himself and guests and by the splendid condition of the mine which they came to inspect. The amount of the work which had been done was an agreeable surprise, although they had expected to see extensive improvements, but the extent and value of the ore body was the most agreeable of surprises. The mine is now looking better than ever, and, without doubt, in a few months, concentrators will be erected near Coryville and a permanent bullion camp established. There are but 21 men at work, at present, but they are doing remarkably good work and no mine on the coast was ever so rapidly and judiciously developed, by the same force and at the same cost. Fourteen feet of drift was made in ore on the 120-foot level, last week, and on the 200-foot level the drift was advanced 25 feet.

Reese River District.

PROBABLE SALE OF THE MANHATTAN.—*Silver State*, Jan. 8: It is reported that the Manhattan mines at Austin have been sold to an Eastern company of capitalists, who have been negotiating for some time past for their purchase. The fact that M. B. Farrell, book-keeper of the Manhattan Co., and L. J. Hanchett, who has been negotiating the sale, left for San Francisco together yesterday, gives color to the rumor.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Jan. 7: Belle Isle and Navajo joint crosscut west, 150-foot level, has been advanced 14 feet during the week. East crosscut, same level, has been advanced four feet; rock continues very hard.

TORNADO CON.—Extended tunnel to feet during the week; ground very tight and no improvement to note. Ledge in south cut very large—we have not reached hanging wall as yet—showing some sulphurets throughout the ledge.

NAVAJO.—During the week, the south drift on east vein, 350-foot level, has been extended 6 1/2 feet. North drift on new vein, 150-foot level, has been extended 12 feet.

NORTH BELLE ISLE.—North drift on east vein from No. 1 crosscut, 150-foot level, has been extended four feet. North gangway, 300-foot level, has been advanced 15 feet. The rock has been as hard as flint all the week. North gangway, 400-foot level, has been extended 42 feet.

NEVADA QUEEN.—Work for the week has been as follows: West crosscut No. 1 from north gangway 200-foot level has been extended 35 feet; total length, 125 feet from turntable, 95 feet to No. 1 shaft. Water has not increased any. No. 1 shaft has been sunk 10 feet. Water has more than doubled during the week; total depth 193 feet. North gangway 350-foot level was started and extended 15 feet; rock very hard.

White Pine District.

BULLION SHIPMENTS.—White Pine *News*, Jan. 8: The Eberhardt-Monitor Mining Co. shipped this week, through Wells, Fargo & Co.'s Express, three bars of bullion, valued at \$2500. The Argus Co. shipped this week, through Wells, Fargo & Co.'s Express, two bars of bullion, valued at \$3100.

ALASKA.

SILVER BAY DISTRICT.—*Alaskan*, Dec. 27: The owners of claims in the Silver Bay district have given the best possible evidence of the faith that is in them by faithfully complying with the law in the way of doing the necessary amount of assessment work. So far we have not heard of a single claimant who is delinquent in that regard. Capt. P. T. Tracy keeps pegging away on the "lower ledge" at the head of Silver bay, where he has a comfortable log house erected, and where he is confident of being able to develop for his syndicate a regular bonanza. This is the ledge in which Messrs. Stone and Swift are interested, and of which one or the other will probably have the management when active mining operations are commenced. Wonder if they

wouldn't like to have a mine in which the "pay shoot" is all pure gold, already coined and ready for circulation? An Eastern party countermanded an order for the examination of a gold-bearing ledge in the Silver bay district with a view to the investment of a few thousand dollars for a controlling interest, because some of the rock sent them assayed no more than \$43.50 to the ton, though some of it had gone into the thousands. It would almost seem as if a ledge 10 to 15 feet wide, between well-defined walls, the rock from which will assay \$43 to the ton, ought to be almost promising enough to gamble a few thousand dollars on.

COAL.—Lieut. Stoney reports finding a five-foot vein of coal of good quality in the Muskovian region, while another party, with whom the *Alaskan* is acquainted and in whom it has confidence, stands ready to show any one who will guaranty him an interest in the mines when developed, a similar vein on Cook's inlet, the coal from which he says he has tried and found every bit as good as, if not better than, that of Vancouver island. The time is not far distant when the coal measures of Alaska will receive such practical attention as will forever settle the question of their adaptability to steam and manufacturing purposes, or else conclusively demonstrate their worthlessness. The *Alaskan* has no fear of the result once the question is fairly and practically settled.

ARIZONA.

PROMISING OUTLOOK.—*Tombstone Democrat*, Jan. 10: The outlook of the camp for its future was never more promising than at present. A limited number of men are being employed in the different mines, and from preparations being made it is apparent that a speedy resumption of work and a revival of former good times is about to be inaugurated. The Emerald mine is working a force of 50 men, taking out ore and shipping it to the Charleston smelter, which is still being successfully operated, and the company are continuing the shipment of bullion. Supt. Cheyney, of the Toughnut, has a force of men at work cleaning up the mill, repairing machinery, laying track, etc., preparatory to starting up the mine and mill. The Knoxville and Wage mines, properties of the Boston Mining and Reduction Co., are being satisfactorily worked by T. M. and M. Co. The ores are shipped to Charleston for fluxing purposes. James Carr, who owns more teams and knows more about freighting than any man in the Territory, will return to Charleston by the 15th, and it is reported for the purpose of entering into a freighting contract with the Copper Queen Co., vice the steam wagon—a financial failure. B. S. Coffman, superintendent of the Rattlesnake Mining Co., is working a force of about 25 men on the Bunker Hill, drifting to connect with the main shaft of the Mammoth, owned by the same company. They have encountered a good body of ore in the drift, and are taking out and shipping to Charleston considerable high-grade ore, carrying chlorides and manganese flux, which until recently has been shipped to Socorro. This company owns three properties, the Mammoth, Bunker Hill and Rattlesnake, all of which are good producers, and they have been working right along without regard to the low price of silver. As soon as the Mammoth shaft is reached the company will put on all the men that can be worked to advantage.

MINING NOTES.—*Prescott Courier*, Jan. 10: Mr. W. C. Dawes has engaged teams to haul wood to the Peck mill, and hopes soon to have the mine dry and to keep the mill running night and day. He says he is certain to make a fortune out of the mine, and we believe he will. Col. H. A. Bigelow, of Hassayampa district, gives good reports of mining in his section. A letter from Tiptop says that the mill is running; company shipping plenty of silver. Pack trains, with rich ore, arrive in Prescott almost every day from the mines. Banks and assay offices handled \$20,000 in gold and \$37,000 in silver last week.

COLORADO.

PROSPECTS.—*Boulder News and Banner*, Jan. 5: The day of prospect holes has passed. The day for developed property is at hand. Baron Von Wendt tells us that he intends working mining property in Boulder county soon. The mining outlook for Boulder county has never been so flattering. The year 1886 was one long to be remembered. But just now we bear it from every camp that 1887 will beat the record of all past years. Benson & Mooney hailed from Ward last Wednesday. They deposited with the smelter some 13 tons of ore from the New Boston mine which sold for \$48 per ton. Time occupied in mining said to have been 15 days. Denver parties are taking hold of Boulder county mines in different parts of the county. Let every miner in the county owning property see that it is put in working order at once. Foreign capital is finding its way into Colorado, to be invested in mining property, and already parties are quietly looking over the fields of this country.

RED MOUNTAIN.—*Cor. La Plata Miner*, Jan. 6: Work is being pushed actively in all directions, and all the mines have lately increased their force, and we expect great activity in mining circles between now and spring. The Brooklyn, which is situated about 1500 feet above the old town of Red Mountain, was some time ago bonded to a syndicate of Philadelphia capitalists, who are represented by Mr. Jos. Wilkinson, of Durango, who awarded a contract for 125 feet of crosscutting on the 10th of last October to Jack Skeely, John McMullen, Darby Hastings and T. Wilcox. The crosscut on the Reality has reached the vein, and shows 20 feet of mineralized vein matter. This is another fine-looking Cockscrew gulch property. A claim of some note is the Chicago, which is being worked by the owners. It has a shaft 50 feet, six by eight feet in the clear, and well timbered. At the bottom is a well-defined streak of low-grade ore, which shows signs of improvement as depth is gained. Tom Guinan will soon take charge of the Dutton mine. He put a small force to work on the Genesee this morning, which he will increase to 15 or 20 men as soon as he gets his new boiler in place. The Carbonate Queen, near the Carbonate King, is looking bigger as development progresses. A streak from 12 to 15 inches wide of good pay ore is showing in the breast of the 30-foot drift which is run from the bottom of a 20-foot shaft.

IDAHO.

THE GOLD HILL MILL.—*Statesman*, Jan. 6: Mr. W. C. Wilcox came down from Quartzburg, Boise county, Tuesday night, on his way to San Francisco. Mr. Wilcox has been at Quartzburg nearly four months superintending the erection of the new Gold Hill mill, and on Friday last he had completed the work and started the engine and set the machinery to running. The engine and boilers and in fact every part of the mill was overhauled, and more than half of the machinery was new—new boilers, new engine bed and principally all the engine was new. Shafting, that was the least warped by the fire at the time the old mill was burned, when it was used again had to be straightened. The mill now runs like clockwork, better than the old engine and old mill ever run. It is a 25-stamp mill, the same as it was before. Mr. Coughanour will start the mill to crushing quartz the 1st of February, and will be prepared to keep it running constantly as in days of old. This mill gives new life to Quartzburg, for the mine has been and probably is to-day, when running, one of the best gold-producing mines in Idaho. It has been operated for 20 years, with no signs of letting up.

LEAD MINES OF WARDNER.—*Coeur d'Alene Record*, Jan. 6: Herbert Lang, speaking of the output of the great lead mines of Wardner for 1886, says: "The gross lead production of the Wardner mines, the only ones which have shipped any ore worth mentioning, will probably amount to 3000 tons of lead, their shipments being at the rate of 28 tons per day, for six months, of a material that will produce, allowing for loss in smelting, 60 per cent of lead. This amount, at 4 1/2 cents, the now ruling price for lead, would be, deducting first the customary loss of 10 per cent in refining, \$256,500. Consequently it follows that for this year the two great mines of Wardner are actually furnishing 30 per cent of the gross lead product of all Idaho."

SMOKY MINES.—*Wood River News-Miner*, Jan. 9: George Montgomery returned from the King of the West mine Saturday forenoon. From him and from other sources we learn that the King of the West shows one of the finest and most extensive bodies of ore on Wood river. They are sinking a two-compartment incline shaft which shows fine ore all the way down, while they are also upraising to the surface with a view to erecting hoisting works early in the spring. This development in the King of the West shows that the mines of Smoky go to the deep, and are destined to rank among the leading producers of Idaho, and is a warning that the mines in this vicinity must look to their laurels or Smoky will take the lead.

THE PACIFIC.—*Coeur d'Alene Record*, Jan. 6: On this considerable prospecting was done at discovery, sufficient to show position and course of vein. This being ascertained, a tunnel was commenced 115 feet west, which, at the time of the reporter's visit, had been run about 45 feet, including the open cut, the greater part of that distance being on the ledge which was struck at bedrock. The trend of the ledge is northwesterly and southeasterly, dipping to the northeast with inclination to the south. The quartz so far is much decomposed, but becomes more solid as depth is attained. It carries sulphurets, but in much smaller quantities than the Arctic. Considerable free gold is visible and the owners think it is likely to prove a free milling ledge. There are probably 50 tons of ore on the dump, 100 feet above the Arctic dump and about 400 feet above the creek. The character of the country rock is the same as that already described. The average of the assays is \$12.50. Marked improvement is noticeable as depth increases.

THE INDIAN lies directly above the Pacific. The discovery stake is 400 feet above the Pacific discovery, and consequently about 800 feet above the bed of the creek. The ledge has a northwesterly and southeasterly course, with northern dip and southern incline. But little work has yet been done on account of the deep snow. Four feet of ore has been uncovered in clearing away space for a shaft. Lowest assay \$9.50.

THE ATLANTIC.—East of and adjoining the Indian, and lying above the Arctic, is the Atlantic, the ledge of which has the same course, dip and incline as the Indian, and the one is probably a continuation of the other. A face of six or seven feet of ore, assaying \$22, is visible where the tunnel will be run. The indications on both the upper claims are very fine, and the owners seem inclined to think that their value will prove even greater than that of the Arctic and Pacific.

NEW MEXICO.

NOTES.—*Rio Grande Republican*, Jan. 6: The Providencia mine, in Chloride flat, is again in rich ore. Two carloads of concentrates are shipped weekly from Pyramid. The Homestead mine, Gold Hill, is showing better at every foot. From Camp Apache mining district the reports are still favorable. At Socorro the daily receipts of ore run from 20 to 60 cars per day. In Germania mine, at Cooney, a 4-foot vein of peacock ore has been struck. Thirteen tons of ore from the Lochiel mine, Kingston, netted \$545, or \$49.61 per ton. Two hundred and fifty dollar ore has been struck in the Shingle canyon mine, Georgetown. The owners of the Jane Bowman mine, Socorro, are much encouraged over a new strike. The Tenderfoot mine, Malone, shipped a carload of high-grade ore to Socorro the past week. Kingston sampling works are overrun with ores. Each miner has to wait his turn to get ore treated. Crown Point mine, Gold Hill, has a fine lot of ore at the dump to be treated by the Standard mill when completed. The Graphic mine, Cook's Peak district, shipped last week a carload of 100 ounces ore to the Socorro smelter. The Young Man mine, Malone, has yielded over \$100,000 to date. Murat Masterson, of Deming, is one of the owners. One hundred and twenty-seven carloads of ore and material was one day's receipts at the Socorro smelters last week. From the Peterson mine, four miles north of El Paso, come reports of ore richly sprinkled with chlorides of silver. The Standard mine, Gold Hill, claims \$200,000 worth of ore on its dumps and blocked out in the slopes of the mine. The Lucky mine, Cerrillos, has reached a depth of 157 feet and has fissure ore that assays \$110 in silver and 33 per cent of lead. The Last Chance mine, Victoria district, has been leased by Gustave Billing, of Socorro, who will put a large

force at work soon. The Kimbell district—Stein's Peak—country is still booming, the ore is abundant, but water is rated at \$1 per barrel. The Chao mine, Chance City, which has been idle for some time, has been leased by Gustave Billings, and work will be commenced on it soon.

MONTANA.

TATRADYMITO ORE.—*Butte Inter-Mountain*, Jan. 11: A letter from Max Meyer, of Brandon, corrects information given us by a former correspondent, concerning Bush & Myers' mine. He says that only one assay has been made so far on the tellurium ore. That was made by the Boston and Colorado smelting works, at Argo, Colorado, and was as follows: Tatradymito ore, sample No. 4, ounces of gold, 223.66; 600 ton ton; ounces of silver, 187 per ton. Fifteen hundred pounds of this ore was worked by arasta process, and from it was cleaned up 12 ounces of gold. The lead matter has a width of from one to three feet. The ore body is from four inches to 6 foot wide, and the streak of tellurium is all the way from one to four inches thick. The Bullion, a mine near Brandon, and worked by A. Cislser, is producing its regular shipments of ore (one carload per month), which is shipped to the Omaha reduction works for treatment. The ore is galena and runs from 60 to 75 per cent in lead, \$150 to \$200 in silver, and from \$6 to \$8 per ton in gold. The Big Chief, owned by Mr. Gilbert, of Virginia City, is producing some high-grade ore.

THE BIG MINES.—*Inter-Mountain*, Jan. 6: A Helena special to the *Inter-Mountain* says that the Drumlunnon produced upward of \$200,000 last month with 120 stamps in operation. It is a great output, and at present is beaten in Montana only by the Anaconda at Butte. Next month, however, the Granite Mountain will make a bid for second place. It promises to see the Drumlunnon and go it \$40,000 better. If the Bluebird had 60 more stamps it would lead all the silver mines of the West in the amount of its production.

OREGON.

SCANT WATER.—*Jacksonville Times*, Jan. 7: There is not enough water yet to give all the placer miners a fair show. G. C. Culy is opening some promising mining claims at the mouth of Brush creek. The miners of Steamboat and Brush creek districts have an abundance of water and will make a good run. Ennis & Cameron are putting a new flume in the old English diggings at Galice creek, which they now own. Austin Sargent struck excellent prospects in his diggings in Brush creek district. He has since sold out to Russell & Co. Considerable ground which was left over from last season is now being cleaned up, and more or less gold dust is already finding its way to this place. Quite a force of men were engaged in prospecting the Gold Hill Mining Co.'s claims last week and found some nice specimens of ore. They have finished their work and returned home.

UTAH.

REVIEW.—*Salt Lake Tribune*, Jan. 7: The receipts in this city for the week ending the 5th inst., inclusive, were \$25,781.45, of which \$125,001.34 was bullion and \$90,780.11 was ore. The previous week the receipts were \$112,353.07 in bullion and \$23,177.76 in ore; a total of \$135,530.83. The Ontario output for the week was 23,097.43 ounces of fine bullion and \$29,477.06 from sales of ore; a total of \$52,574.49. The year opens with an undimmed prospect for this great property. The daily product of the week was nine bars of bullion, 13,698.93 fine ounces, and \$5931.23 in ore, an aggregate of \$19,130.16. This company now has a good surplus, and will no doubt at an early day join the ranks of the dividend-payers. Base bullion receipts for the week were \$6,886.47; fine bars, \$43,094.11; gold bars, \$8584; silver bars, \$14,624.69; selected lead, \$5926.08. The product of the Hannauer smelter for the week was \$20,455 in bullion. The stormont sent up on the 31st silver bars to the value of \$330. The Bannock sent down from Elia on the 3d, bullion to value of \$1920. Ore receipts in this city for the week were \$42,604 by Wells, Fargo & Co.; \$40,730 by McCormick & Co., including \$11,480 from the Queen of the Hills; and \$7446.11 by T. R. Jones & Co.

SUNNY BOY'S GROUP.—There is a group of mining claims of much promise over on Bonanza flat, toward Snake creek, that is worthy of special notice, mention of which was omitted in the *Record's* New Year's edition for want of space. This group is owned by bond by F. McLaughlin, H. Hirschman and F. J. McLaughlin, who have spent considerable money in development work on the claims. The Columbia, Silver Bell, Kentucky and Tessie are the claims of the group which were located only a few years ago. On the Columbia is a shaft down 125 feet alongside the vein, which assays well in silver, lead and some gold. The Columbia incline, down 125 feet to the top of the ledge, shows splendid indications. The Silver Bell, which is an extension of the Columbia, is developed by a 200-foot tunnel and a shaft now down about 100 feet, all in ledge matter. On this property there is a drift of 60 feet on the line of the vein, and a crosscut has been run a distance of about 100 feet to tap the vein at a lower depth. The workings in these two mines are connected, but active development is at present delayed on account of the amount of water which flows from the upper workings too fast for comfort. The assays from the Silver Bell run higher than the Columbia, some average samples going as high as 27 ounces gold with a fair percentage of lead. This group was recently bonded from B. Hamilton, and a transaction of a startling nature will likely be heard as being in process of negotiation, very soon, on this fine property. Our informant assures us that big results can be looked for from the Rochester group next summer. In the discovery shaft the vein contains about 10 inches of ore that runs from \$700 to \$1000 per ton. This strike is a late one and bids fair to put out hell. The Hamilton, owned by Brig Hamilton, H. Hirschman, Geo. Tait, Wm. Wright and others, is a good property. This claim is worked by a tunnel which has been persistently driven 214 feet in solid granite. It has been run to tap the ledge at a great depth, and the work of 12 or 15 feet more is expected to expose the hidden treasure of the vein. The owners have every confidence in this ground, and there is little doubt but that they have a good thing.

NOTICE TO GOLD MINERS! SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES
FURNISHED ON APPLICATION.

**SAN FRANCISCO NOVELTY AND PLATING WORKS,
No. 108 FIRST STREET.**

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,
—DEALER IN—

Assayers' and Mining Material.

—MANUFACTURER OF—
BATTERY SCREENS AND WIRE CLOTH.

Agent for **HOSKINS'**
HYDRO-CARBON ASSAY FURNACES.

JAMES' PATENT RECIPROCATING STAMP MILL.

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

PRICES:

Reciprocating Stamp Mill,	\$350 00

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

Warranted the Best Made, Durable and Satisfactory. Full weight of silver and best quality of plating guaranteed.

BEST SOFT LAKE SUPERIOR COPPER USED.

3000 Orders filled. References first class. Prices the very lowest. Have received every Medal awarded on the Pacific Coast for Mining Plates. Old Mining Plates Bought, Replated, or Gold Separated.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS, 653 & 655 Mission St., San Francisco.

E. G. DENNISTON, Proprietor.

These Plates can also be procured of **JOHN TAYLOR & CO.,** Dealers in Assayers' and Mining Material, 112 to 118 Pine St.

NOTICE.—Mining men are cautioned against purchasing inferior quality or Silver-Plated Mining Plates now being manufactured in this city. There has been a general complaint by purchasers that these plates proved defective in plating and short in weight of silver, assays showing great deficiency in silver guaranteed. Thin, light plating looks the same as heavy, but has no durability. Good plates can be furnished at same price these rock plates cost.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskio et als.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

PATENT

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

Practical Treatise on Hydraulic Mining. By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for \$2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.**SELBY****SMELTING and LEAD CO.,**

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

...MANUFACTURERS OF...

BLUESTONE,**LEAD PIPE,****SHEET LEAD,****SHOT, Etc., Etc.**

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges, Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Malign Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager.

ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

O. A. LUCKHARDT & CO.,

(Formerly Hubb & Luckhardt,)

Mining Engineers and Metallurgists.

J. KUSTEL.

H. KUSTEL.

**METALLURGICAL WORKS,**

318 Pine St. (Basement,)

Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my

Process.

Assaying and Analysis of Ores, Minerals and Waters.

Mines Examined and Reported on.

Practical Instruction given Treating Ores by improved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.

O. H. AARON,**ASSAYER AND METALLURGIST,**

NOGALES, ARIZONA,

Will attend to business in connection with mines in Sonora or Arizona.

WM. D. JOHNSTON,**ASSAYER AND ANALYTICAL CHEMIST.**

514 Kearny Street,

SAN FRANCISCO, CALIFORNIA

ASSAYING TAUGHT.

Personal attention insures Correct Returns.

SPENCERIAN STEEL PENS Are The Best

Established 1840.

USED BY THE BEST PENMEN

Noted for Superiority of Metal, Uniformity, and Durability.

20 Samples for trial, post-paid, 10 Cents.

IVISON, BLAKEMAN, TAYLOR, & CO.,

753 and 755 Broadway, New York.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

VENTILATING CARS.—Joseph A. Buckley and Chas. J. Koefed, S. F. No. 355,586. Dated Jan. 4, 1887. This is a device for supplying cars with pure, cool air. Fan-blowers are mounted in pairs on the wheel-trucks of the cars, and there is a water-tank in the cars into which the air from the blowers is discharged, and an independent ice chamber above, through which second chamber the air is conveyed. The dust and foreign matter in the air is caught in the water. The air pipes are so arranged as to arrest any moisture.

VENTILATING CARS.—Joseph A. Buckley and Chas. J. Koefed, S. F. No. 355,587. Dated Jan. 4, 1887. This is a device for ventilating cars by constantly removing from the car the fuel and heated air which accumulates therein. This is accomplished by suction-fans, so mounted that one will act while the car is moving in one direction, and the other when the car is moving in the opposite direction. Suitable pipes and valves are arranged to perfect the invention.

GOPHER GUN.—Frank L. Emerson, Brentwood, Contra Costa Co., Cal. No. 355,602. Dated Jan. 4, 1887. This is one of the class of guns especially adapted for killing burrowing animals, such as gophers, ground squirrels, etc. These animals are found in great abundance in the western part of the United States and elsewhere. The invention consists in the combination of parts which form a complete gun, easy of operation and effective for the purpose. It may be easily inserted in the required position, and after being set may be loaded with safety and discharged with accuracy.

Mining Share Market.

Mining stocks have been rather active this week. The volume of transactions is such as to keep all the brokers very busy, and, by the way, there are many more brokers in business than there were a month or so since. Chollar, Potosi, Norcross, and Savage have been leading. The strength of these stocks, the *Enterprise* thinks, is due to very interesting developments of ore being made on the 1300 level of the Hale and Norcross, and the fact that an east and west crosscut has been started on the Chollar line; also that No. 6 west crosscut on the 600 level of the Savage shows about 12 feet of good ore, and the south drift on the 500 and the Suro tunnel levels are also in ore. In Potosi the upraise from the southeast drift, on the 250 level, is up 50 feet, and is still in good ore. The Belcher, Crown Point, and Yellow Jacket mines continue to make large daily shipments of ore to mills on the Carson river.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know any send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

SONOMA COUNTY COAL.—Work at the King & Hills coal mine, on Mark West creek, five miles north of Santa Rosa, is being prosecuted diligently. A shaft has been sunk over 125 feet. This is intended to tap the main ledge. One ledge, eight inches in width, has been passed, the quality of coal taken from it being far superior to that found near the surface.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

BULLION valued at \$25,000 was stolen from the St. Augustine mine, Sonora, Mexico, a few days since.

Golconda Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Calico Mining District, San Bernardino County, California. NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 22d day of December, 1886, an Assessment, No. 2, of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 4, 309 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 27th day of January, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the 16th day of February, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. M. BUFFINGTON, Secy.

Office—Room 4, 309 California St., San Francisco, Cal.

THE ORIGINAL Roller Ore Feeder

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a card appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite these in operation at the "Bunker Hill" mill in Adair county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO., ADAMOR CITY, CAL., July 12, 1886. To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ore to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly, (Signed) N. W. CROCKER, Supt.

SAN FRANCISCO, Jan. 3, 1887. To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: Having used four (4) of the "Roller" or "Templeton" Ore Feeders, built by the Golden State and Miners' Iron Works, of this city, for more than a year last past, in the Bello Gopher Mill, in El Dorado county, this State, and being acquainted with the superior principles of construction and the operations of the "Challenge" Feeder built by yourselves, I unhesitatingly indorse the statements made by Mr. N. W. Crocker, Superintendent of the "Bunker Hill" Gold Mining Company, under date of July 12, 1886, as to the irregularity of the feed of the "Roller" or "Templeton" Feeders under the conditions of use which he names, and I am very truly yours, (Signed) W. G. ROBERTS, Of Greenwood, El Dorado Co., Cal.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

HENDERSON'S PATENT TRUSS.

Comfortable and Reliable.

This simple truss can be worn without inconvenience, and gives all the comfort to the wearer that can be obtained from a perfect-fitting, pliable apparatus. The pad is soft and yielding, and on account of its peculiar construction and the connections of its securing bands, cannot get out of place. It will remain in place no matter what position the wearer may assume. The engraving shows the construction of the appliance. It is simplicity itself, and is comfortable and reliable. Address,

JESSE G. HENDERSON,
 Grizzly Flat, El Dorado Co., Cal.

Applegarth's Ore-Roasting Oven.

Our new ore-oven is the best in the world for separating the base from the precious metals. The furnace is intended to be worked right at the mine itself, where the ore is produced. It uses very little fuel indeed, and is perfectly economical and practical. Royalty for sale

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Best question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE of OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Small Companies in Mining.

It is noticeable that small companies have in the prosecution of mining been more successful than large ones. So generally has this been the case as to become a well-recognized rule. Nor is this rule confined to mining alone. It is one of wide application.

An organization or partnership made up of a few men, provided there are enough of them and they have efficient means for the proper conduct of their business, whatever it may be, is apt to do better than companies consisting of large numbers; nor is it strange that this should be so. A few men in associating themselves together for business purposes are largely governed in their choice of each other by considerations of individual fitness, character, and temperament, various other peculiarities being also taken into account. A partnership or company so constituted in its integral parts is apt to be in accord in all that relates to its common interests. The members are apt to work in harmony; the institution is also efficient, each member performing the duty or service for which his experience, training and natural aptitudes especially fit him.

In the history of California mining the above doctrine finds exemplification in numerous instances. In the case of the Idaho Company at Grass Valley it is well illustrated, the two Coleman Brothers and three or four other persons being here the almost exclusive owners of the property, the Colemans its sole managers. Taking its record as a whole, this may be considered the most prosperous mine in California. In the Providence mine at the same place we have a similar instance of small ownership coupled with large net earnings and superior management.

Turning to individuals, what a conspicuous success have Hearst, Haggin and Tevis, acting as a triumvirate, proved in the mining world working together. The one in the field and the others in council, they seem to have made no mistakes, or if they have made any they have been astute enough to conceal them. Agsin, what a mining team we have in Hayward and Hobart, who, having marched from conquest to conquest, command now the confidence of every one. Four men were mainly instrumental in digging out the big bonanza on the Comstock. The results achieved by Hamilton Smith, Egbert Judson and L. L. Robinson in the province of hydraulic mining are wholly unparalleled in the history of an industry noted for its gigantic operations. Here again we had an organization small in numbers but perfect in all its parts, Smith being competent to the performance of the boldest engineering feats, Judson conspicuous for practical wisdom and Robinson for energy and almost every other sterling business qualification. Without multiplying these examples, suffice to say these lessons tending to teach the superiority of small, compact, carefully organized companies over large and unwieldy ones are numerous in California, nor are they wanting in other mining countries.

HENRY HAWKINS, one of the owners of the Morning Star mine, near Auburn, Placer county, was killed by a cave in one of the lower drifts last Saturday.

THE Carson mint has been open a few months as an assay office, but does little as a mint, receiving a very small quantity of silver bullion.

Jardine's Multiple Punch.

Some of our sages have said that man is a tool-using animal. Take out of our midst the men who make the tools that uphold the civilization of this age, and the whole human race would be set back into barbarism. Among the tools that show an advance in one branch of art is that which we show on this page. It plays an important part in the development of the fast-growing artesian

builder and inventor is J. B. Jardine. The engraving shows the smallest power machine he makes. Oregon is ahead of California in the size of these machines, as one has been shipped to Portland that will punch 100 holes, or shear a sheet of iron 50 inches wide at one stroke.

These machines can be used either for shearing or punching. They will do for pipe work, malt-kiln floors, mash-tub strainers, or any kind of work requiring perforation or corrugation of iron, copper, or other metals. The

JARDINE'S 30-GANG OR PIANO PUNCH.

well system of the country. It was not until tools had been invented to make the sheet-iron casings and linings for our artesian wells that such wells became the perfect things they now are. The sheet-iron pipe for bringing water to mines and cities has also aided the advance of civilization. Take out all the sheet-iron pipe

machines are made by J. B. Jardine, 213 and 215 Mission street, San Francisco. The list of iron-working machinery built by this firm is quite extensive. They make over 100 different styles of punching and shearing machines, not to speak of lathes, planers, bolt-cutters, drill-presses, etc. They would only be too glad to

DRY STONE DAM USED IN CALIFORNIA.

that has been made and is to-day doing duty throughout the sparsely settled State of California, and immense damage would be done. Most of this pipe has been made by this or similar machines.

This machine does the work of preparing the iron by steam power. A boy can do as much with it as six men could in the old-fashioned way, so we can build pipe in San Francisco cheaper than can be done in interior towns where rents are cheaper, but where hand work is done. It is really a gang or multiple punch. It punches from 1 to 60 holes in No. 10 sheet iron at one stroke and can easily make 20 strokes a minute.

The holes are made clean and quickly. The

get out the tools necessary to build a Government cruiser. During the year 1886 they built three small steamers—two for Goodall, Perkins & Co. and one for the Mexican Government.

LONDON still leads San Francisco in shipments of silver to China, Japan and the Straits, her exports having been \$26,519,328 in 1886. Those of San Francisco being \$16,558,612 and Marseilles \$956,650. The total export to the countries named being \$44,034,590 against \$56,109,949 in 1885.

THE assets of the Bank of California are nearly \$13,000,000, and those of the Nevada Bank over \$14,000,000.

Dams in California.

Among the most important dams built in California are: The Bowman dam, high 100 feet; length 425 feet; three dams owned by the Milton Mining and Water Company, forming the English reservoir, the largest of these having a high of 131 feet; the Fordyce, of the South Yuba Canal Co., 567 feet long and 75 feet high; catchment basin, 40 square miles; the Enreka Lake dam of the Eureka Lake and Yuba Canal Co., length 250 feet and high 68 feet. All these dams are built of dry rubble stone and faced with a water-tight lining of planks. An engraving of this kind of dam we take from Mr. Bowie's work on Hydraulic Mining in California, together with these facts:

The Tuolumne County Water Company built several timber crib dams, the largest across the south fork of the Stanislaus river. This dam, which is 300 feet long and 60 feet high, rests for its entire base on solid granite bedrock. The cribs, constructed of round tamarack logs, from two to three feet in diameter, and about eight feet square from log to log (10 feet center to center), and the timbers are pinned together with wooden treenails. The cribs have no rock filling.

The face is formed of flattened three-inch timber pinned with wooden treenails to the crib and calked with cedar bark. The flood-water passes over the crest of the dam for the entire length. The water is drawn off by several gates, one above the other, placed on the inclined water-face. The dam was built in 1856. Its total cost did not exceed \$40,000. Pine dams owned by this company, constructed on the same plan, have decayed, while cedar cribs are still in perfect order. The Spring Valley and Cherokee Co.'s Concow reservoir, in Butte county, is formed by two earthen dams, each about 55 feet in height; one of these, which is used as a waste, has its lower side built of heavy brush, imbedded in the earth.

The Leaching Process.

Although the process of leaching (or lixiviation) ores has long been known, it is only within the past few years that it has attracted so much general attention. Certain classes of ores from which the precious metal cannot be fully recovered by amalgamation, can be successfully treated by this process. The system has been fully described by Aaron and Kustel in their respective books on the subject, and the important improvements by Russell, described by Stetefeldt, have added to the interest and value of the process.

Metallurgists all over the country are eagerly reading all that pertains to the process of leaching, and we have endeavored to publish as much as possible concerning it. The articles now being printed in the PRESS, and written by Mr. C. A. Schenck, are of great utility, as they are the observations of a skilled metallurgist, made during practical work on a large scale. This week we give a diagram showing how the leaching works are arranged, with a very full description of certain portions of the process. There is still one article to come, and that relates mainly to the cleanup. We employed Mr. Schenck to write this series of articles, knowing that he had made a special study of the subject, and because his opportunities for practical observation were exceptional.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Scripture Misquotations.

EDITORS PRESS:—In your editorial of January 1st, you reply to my note which appeared the previous week. At the close of your article, you say it is your place to correct errors in Holy Writ which relate to mining. If that is the case, you ought to be accurate in your quotations of Scripture. You quote as from Job 8-1, the following passage: "Surely, there is a vein for the silver and a place for the gold where they fine it." Well, you are just 20 chapters below the one containing that verse, and the word *the*, I put in italics, does not occur in the sacred version. The author of the Book of Job is not so specific as to say that all existing gold is in places or placers; he only intimates that gold does exist in such places. The *gravamen* of my charge against you was that in your editorial of December 4th you were booming silver mining at the expense of gold lode mining, as well as truth. Your recent article proves the justice of my charge.

In it you say: "We believe with some biblical commentators that our rendering of the text is the correct one." Your rendering as given on December 4th was this: "Gold is where you find it." We will see what becomes of this utterance under a justifiable analysis. It means "Gold exists where it is, and you find it there." It would be very remarkable indeed if gold did not exist where it was, and equally remarkable if it could be found where it did not exist. The writing of Moses in the Pentateuch, as well as the Book of Job, is always clear and logical. To make such twaddle as the above drivell from his pen, is unfair to a learned and distinguished writer. I supposed that Paul was the creator of the finely sounding but senseless words, not St. Paul, but Safe Deposit Building Paul, whose inspiration, until he blossomed out as a Bible translator, never carried him higher than a quartz mill revolving battery, but now you announce it as your rendering of scripture truth. And who, pray, are the Bible commentators who agree with you as to these words being the proper rendering for the last half of the first verse of Job 28? You cannot name them, simply because they do not exist.

But I am not done yet in presenting proof as to the justice of my charge against you. In your last editorial you go on to say, "The sacred writer is here describing where and under what conditions the precious metals occur; silver in veins, and gold, as 'Prospector' himself remarks, in placers, or in such places as you may happen to find it." In these words you plainly ignore the presence of gold in quartz veins, and you try even to make me a supporter of your opinion, that gold is a most uncertain metal to search for, and is just as likely to be found by a "tenderfoot" prospector, or pistol-ferous "cowboy," as by a person skilled in the "indications" of blind lodes who can find them under a careful system of reasoning as to the spots from which "float" ore may have come. In my note which appeared on December 25th, I protested against making an improper use of Bible language to convey the impression to your readers that gold might be found by blind chance-digging. You did not heed my protest on that point, and you seem to imply now that I had protested against an opinion you held so tenaciously that you would not relinquish it.

I believe the verse in dispute may justify a wider interpretation than that I gave it in my previous letter. If you were writing for the PRESS an account of the Comstock lode, with a consciousness that your words would be read 5000 years hence, it would be made as short and plain as possible. Getting your pattern from Moses, you would probably say "Certainly, there is a silver vein at Virginia City, and a place for gold where they make it fine." That would be intelligible enough to your readers of this year, for they know the Comstock gold is parted in a suitable place. In Job 28-2 are these words: "Iron is taken out of the earth, and brass is molten out of the stone." It is evident that the author is here describing how the products of nature are utilized by the skill and industry of man. Now, may he not, in the previous verse, he following the same line of reasoning? He may be referring to a silver vein carrying gold, and wishing to say that the metallurgist of that day was able to save the higher metal in a fine state, he adds, there is "a place for gold where they fine it." If the word *refine* had been used, there could have been no mistake, but every one knows that words appropriate in one age become obsolete in another, and yet "fine" is intelligible enough, and has nothing about its connection to warrant the substitution of "find."

If, in 5000 years, some mining journalist, a self-appointed conservator of all the mining utterances of the press of our day, should, with the aid of an Almarin B. Paul, then upon the earth, insist upon making you say in your description of the Comstock—"Certainly there is a silver vein at Virginia City, and gold is where you find it." I trust you will have the power to come back to this world and smite them both in the fifth ribs. If not, then I hope some prospector of that age will "go for them" as I am going for you.

I have only one point more to allude to. You say, "'Prospector' appears to have great

confidence in the biblical lore of our local clergy." I expressed no such confidence. I merely quoted Dr. Sprecher as having alleged that San Francisco was the wickdest city in the United States. Your dragging Jonah and the whale into the controversial arena displays a strong sign of conscious weakness on your part. If you have any dim, distant hope of making us the Jonah on this occasion, I hereby give warning that whale though one of you may be, I shall kick so hard at his true inwardness that he will inevitably be glad to throw me out on dry land and "he at sea" again beyond my reach.

A PROSPECTOR.
Dos Cabezas, Arizona, Jan. 7, 1887.

Theory of Earthquakes.

EDITORS PRESS:—In the December number of a magazine called the *Forum*, published in New York, there appears an article entitled "The Cause of Earthquakes," from the pen of Major J. W. Powell. I propose to criticise briefly some vulnerable points of that article. He bases his theory of earthquake cause on the "molten mass" theory of the earth's constitution. We will therefore analyze this feature of his argument first. In compliance with the deductions of astronomers, geologists have added to their original 30-mile limit until they had established 800 miles for the orthodox thickness of the earth's crust; but Major Powell discards all of this, and now brings the limit back to only 20 miles of thickness. He states the only argument ever advanced in support of the molten theory, namely, the increase of temperature as a descent is made from the surface. Geologists seem never to have considered that this argument if pushed to its logical sequence entirely defeats itself. The rate of increase is stated to be one degree for 50 feet. That would amount to 105 3-5 degrees for a mile. The semi-diameter of the earth is 3963 miles; therefore at that ratio of increase the heat at the center of the earth will have attained to 418,512 degrees, a condition of matter of which the human mind is incapable of forming any conception. At a depth not exceeding 100 miles all known substances would become volatilized, and the earth instead of being a mass known in the aggregate to be about five times heavier than water, would become merely an immense halloon as compared with other planets. But Major Powell and other geologists will say we do not suppose that the same ratio of increase in heat observable at the surface continues entirely to the center. You do not assign any cause for its stoppage at the point of fusion, consequently you cannot give any logical reason why it should proceed to that degree, especially when scientific deductions approaching very nearly to demonstrable truth teach that it does not do so. Furthermore, you will say that even if the increase of heat does continue to the point of volatilization, the immense pressure of the superincumbent mass of solid crust will prevent the assumption of the gaseous form. Another feature of your theory relating to earthquakes annuls that idea. You say that all earthquakes are primarily caused by the fracture of the thin, solid crust. If the main body of the earth existed as a liquid mass under such pressure as is alleged, whenever a fracture of so thin a crust occurred, a resulting outflow would continue until a normal state of equilibrium had been attained, as a matter of course leaving the matter volatilized by heat in a gaseous form. You say that earthquakes and volcanoes have an intimate connection, and both result from the same cause, namely, fractures of the earth's crust. You say that the fracture of the crust is caused by the interior cooling faster than the surface, thereby producing an interior shrinkage of the plastic or fluid portion to which the thin rigid crust cannot accommodate itself otherwise than by disjunction. You assume that the molten matter ejected from volcanoes comes directly from the interior fluid mass. You say that earthquakes are a constant phenomena, occurring at some point on the earth's surface every hour in the day, that earthquakes are the result of fracture, that fracture is primarily produced by a vacuum between the solid crust and the soft interior, consequently there must constantly exist such a vacuum. Now it is clear that under such conditions there never could exist a single volcano; for there would not be any force to project through fractures to the surface the molten matter which they exhibit. I shall have more to say on this subject in another letter.

JUSTIN CHENOWETH.

TEST OF A GOOD WORKMAN.—An exchange says that fitting a key constitutes a good test of a working machinist's ability. Set 50 men to fitting 50 keys, or splines to the same keyway. When they are all done, you will not find three keys that will fit alike. A key must fit the hole completely, or it is useless. If it bears a ridge here and lump there, or is full of small places, it is of no use. Make a sliding fit on sides of key, and driving fit on top and bottom for most purposes.

NITER PROSPECTORS.—A party of prospectors who understand making the necessary tests will start next week to prospect the alkali flats of this county for niter. There is one section east of the Gillis range in which they feel confident of finding nitrates in large quantities, and should their expectations be realized, another profitable industry will be added to the resources of this county.—*Walker Lake Bulletin*,

Roasting and Leaching of Silver Ores.

NUMBER 4.

[Written for the PRESS by CARL A. SCHENCK.]

The Work of Charging and Emptying

This vat is done by contract; 30 tons, which is about the charge of a vat, fill it up level to the edge of the walls or staves, and it takes four men from eight to ten hours to do this work. The ore is first washed with water, to dissolve base metals and surplus of salt, for which purpose the first wash water is forced to rise through the column of ore from the bottom, in accordance with Mr. O. Hoffman's plan of precipitating silver chloride dissolved in this strong first brine, on the surfaces and in the charge. Two pipes made of inch board—about six inches square in the clear and six feet high, and closed at the end on which they stand in the vat, being also provided with slits 1 1/2 inches high and as wide as the side of the box, one slit to each of two opposite sides, immediately above the bottom board—are placed in the right position before the filling of a vat begins, one box near one corner, the other diagonally opposite. In the column of ore which fills the tank, two hollow spaces are in this manner left out, into which the water is run as soon as the sample is taken, rising in the ore from bottom to top and decreasing slightly its bulk, so that when the water comes at last to the surface and is uniformly spread over it, the charge has sunk down all over, four to five inches from the edge. One of the two streams is now discontinued and the other one led in directly on the surface of ore with such an increase in volume that the strong brine is quickly diluted. To prevent a digging up of the surface by the water under high pressure, it is first led into a box or over a wide and long piece of board, from which it is distributed gently over the ore. The discharge pipe is now let down and turned into the waste trough until calcium polysulphide proves the presence of metal chlorides, when the discharge is turned into this brine trough and conducted into the brine tanks until the reagent mentioned no longer produces in the brine any precipitate. This proves that the soluble base-metal chlorides, with some of the silver, have been washed out of the ore; but a surplus of salt is still present. The discharge is therefore turned back into the waste trough, and the washing with water continued till it runs from the ore with a fresh taste and shows a density of one-half degree—not more—on being measured with Beaume's hydrometer. In the meantime, the brine tanks have been precipitated by calcium polysulphide, the required amount of this reagent having been previously and approximately determined upon by a test, the last small quantities needed being ascertained by one or more tests during the process of precipitation.

The water having been turned off from the leaching vat after washing out of base metals and salts, which operation takes about 12 hours, the surface of the ore is soon uncovered and gets dry enough to walk upon, when it is once more leveled off for the subsequent introduction of hypo, which is turned on when the gradually decreasing discharge into the waste-trough is not thicker than a common lead-pencil. The hypo, now turned on in a full stream, is also received from the mouth of the pipe in a box for a quiet distribution over the surface. The hypo in working its way through the ore displaces the last portion of water, wherefrom this part of the process is called "the changing from water to hypo."

The Change from Water to Hypo.

Or the determination of the time when the discharge running into the waste-trough has to be turned into the trough leading to the precipitation vats, is of importance, as will appear from the following reasoning:

The thin stream of waste water increases again in thickness after the hypo has been turned on; the hypo displaces the water, and if the first descends uniformly through the column of ore in the vat—the ore not being more packed in one place than in others—that time has now to be ascertained when all the fresh water, mixed with but very little hypo, has run out and is followed by a full discharge of pure hypo. And if this moment is not determined with that precision which the nature of the case permits, too much hypo, already carrying perhaps silver, will be lost; or, the discharge being turned too soon into the precipitating vats, dilutes the hypo solution. Preliminary conditions for fixing the moment are:

1. Equal density of the column of ore in all points of the same level, wherefrom it becomes obvious that all lumps which, moreover, cause losses in other respects, should be separated in charging a vat.

2. The filter should be so constructed that the solution to be filtered does not need too much time in passing through it, and so that the filtrate may freely run out, which is not the case with a rock bottom, where, moreover, small portions of the filtrate may be retained in the nooks and corners, which in being washed out in the progress of the work may cause mistakes and losses. (It has been within the writer's experience that the first wash water running from a new charge and rock bottom had all the taste of a strong silver solution.)

In regard to the means in use for determining the change from water to hypo, or, in other

words, when the discharge is turned from the waste-trough into the hypo-trough, the operator is guided by the taste and a few chemical tests. The discharge must show a peculiar taste, characteristic to the calcium hypsulphite, not sweet, which would be going too far, but quite different from the taste of fresh water; a drop of lead acetate must produce a peculiar and sufficiently copious precipitate quite distinct from that in fresh water. Calcium polysulphide is also used to precipitate such amounts of dissolved silver which are yet too small to be detected by taste, which test then would indicate that dissolving of the silver has started, that pure hypo with little silver has displaced the water, and that it is high time to throw the hose from the waste-trough into the hypo-trough. But

All These Teets

Are only of value in the hands of an experienced and conscientious operator, and they do not, after all, give us that nice precision which we would like to have, but which from the nature of the case we cannot expect, the change in the composition of the discharged stream, from water to hypo, not being so distinct as one might think. Mr. Stetsfeldt comes nearest to a complete solution of the problem involved, making the work, moreover, independent of individual qualities. He determines the volume of water which is held back in the drained but yet saturated charge and then runs in by portions the same volume of hypo; all the water is displaced by hypo when the same volume of the latter has been run in and in its gradual descent just disappeared under the surface. The hose is now thrown into the hypo-trough and a full stream of hypo turned on.

What is said here about changing from water to hypo holds also good in the following

Change from Hypo to Water.

The solution from the discharge pipe, running in the hypo-trough, soon gives a sweet taste—not agreeably sweet, but rather offensive and increasing in strength, until, at last, a maximum of taste is obtained, whereupon it gets weaker and weaker, disappearing with the hypo leaching. It takes from 24 to 30 hours to leach a 30-ton charge. Pure hypo is now continuously run in from the surface, while the hypo containing silver is drawn off from the bottom and conducted through the hypo-trough into the precipitating vat which was drawn off last. The surface of the ore under leaching must now always be well covered with hypo, and the discharge pipe is clamped if from whatever cause the supply on top is not equal to the outflow. Frequent tests with calcium polysulphide should also be made, to watch the gradual increase and decrease in richness, and the stream of hypo must be shut off when all the soluble silver compounds have been washed out of the ore, which again is ascertained by tests. As soon as the surface is now dry enough to walk upon, the thin black layer of silver sulphide on top, which has been deposited during the leaching, is scraped off with care, whereupon the tailings sample is taken. It is necessary to anticipate in order to explain the nature and presence of this thin layer. After the precipitation of the silver, the silver sulphide is given time to settle; the renewed hypo is then drawn off into the sump or settling tank, from which it is pumped up into the storage vat; but the settling is not so perfect that the lightest and most minute particles of the precipitate can go down in time to the bottom; they will remain floating in the liquid for hours, longer than in practice can be allowed to the settling. By the work of stirring, which is required at each precipitation, the accumulated precipitate is also more or less stirred up, so that it will cause by division the formation of more of these floating particles. They flow out with the hypo into the sump, where only a portion can settle; the rest is also pumped up into the storage vat and carried from there with the hypo over the charge under leaching. The ore acts now in respect to them like a filter, so that in the course of the leaching this thin black layer is formed. After scraping it off, whereby it gets unavoidably mixed with some sand, it is wheeled away to a place of storage for further treatment.

After turning off the hypo on top the outflow begins to decrease, and if it has at last dwindled down in size to the thickness of a penholder, fresh water is again turned on to wash out the last portions of hypo. The discharge is led into the waste-trough, and the water turned off on top, when the hypo has been displaced by water. About half an hour later the tailings are dry enough to be shoveled out and wheeled away to the dump. The rock bottom, which consists of smaller stones in its upper part, should not be disturbed in this work, and the cautious care which the shoveler takes, when he thinks he is near the rock bottom, gives rise to

Another Drawback in its Use.

A very thin crust of ore may be thus left in the vat; in the course of time it gets hard, increases in thickness and retards at last more or less the filtering and outflow of the solution.

The troughs for conducting waste water, silver solution and brine are made of lumber and placed parallel to the line of vats at the foot of a long stone wall, which in height reaches from the top plane of the precipitation vats to the level of the car track. Each solution has its separate trough; the one for waste water is of V shape and nearest to the angle of the stone wall; next to it is the narrow brine trough, square in section, upon which follows the wide and deeper hypo-trough, also square,

The latter is made deeper and wider than there may be always ample room in it for the silver solution, for instance, if two or three tanks are running. Square openings of liberal size are left out in the wall to make room for the discharge pipes.

Precipitation.

Four round tanks built of pine staves and well bound with iron, 16 feet deep and 14 feet diameter (these dimensions are given from memory and may not be quite correct), are in use for receiving and precipitating the solution of silver. [See engraving.] They stand in a row parallel to the line of upper vats, but so much lower as need be, to receive the discharge from the latter. The difference of level between these two systems of vats is therefore determined by the outside height of the upper vats plus the depth of the hypo-trough. The hypo-trough is laid over the line of lower vats inside those points of circumference which are nearest to the stone wall, and is provided with holes in its bottom, one for each vat, from which the solution drops into the receiving vat beneath. When out of use, these holes are closed by well-fitting wooden plugs.

The precipitation vats are numbered from 1 to 4; they are only filled to within 1½ feet from the top. When No. 1 is full, the stream of silver solution is turned into 4, which has been drawn off while 1 was filling; the silver of one must now be precipitated; No. 2 is the last one which has been precipitated and is settling;

the hypo. This small amount is not lost, and its presence is a sure proof that the reagent is out in excess. In this manner the operator approaches and gains his point, slowly, perhaps, but surely. If, by mistake, too much of the calcium polysulphide has been used, so much of the silver solution must be run in as is needed to neutralize this excess. This is not only a very tedious operation in causing loss of time, especially when the solution is weak; the precipitate formed in an overprecipitated vat by running in more silver solution is also of such a nature that it only settles after a long while. But this excess must be balanced by all means, as it would, if remaining in the hypo, cause a direct loss in the leaching vats. Vigorous stirring is of the greatest importance to do quick and satisfactory work. The time of precipitating a vat is in the average about half an hour, and the number of piles of this reagent, the density of which is about equal to 12° Beaume, varies with the varying richness of the solutions to be precipitated, from ¼ to 30 and more being needed, the vat into which the cream of the leaching was run requiring the highest amount. The time allowed for settling of this precipitate should never be less than four hours.

Return of the Regenerated Hypo to the Storage Vat.

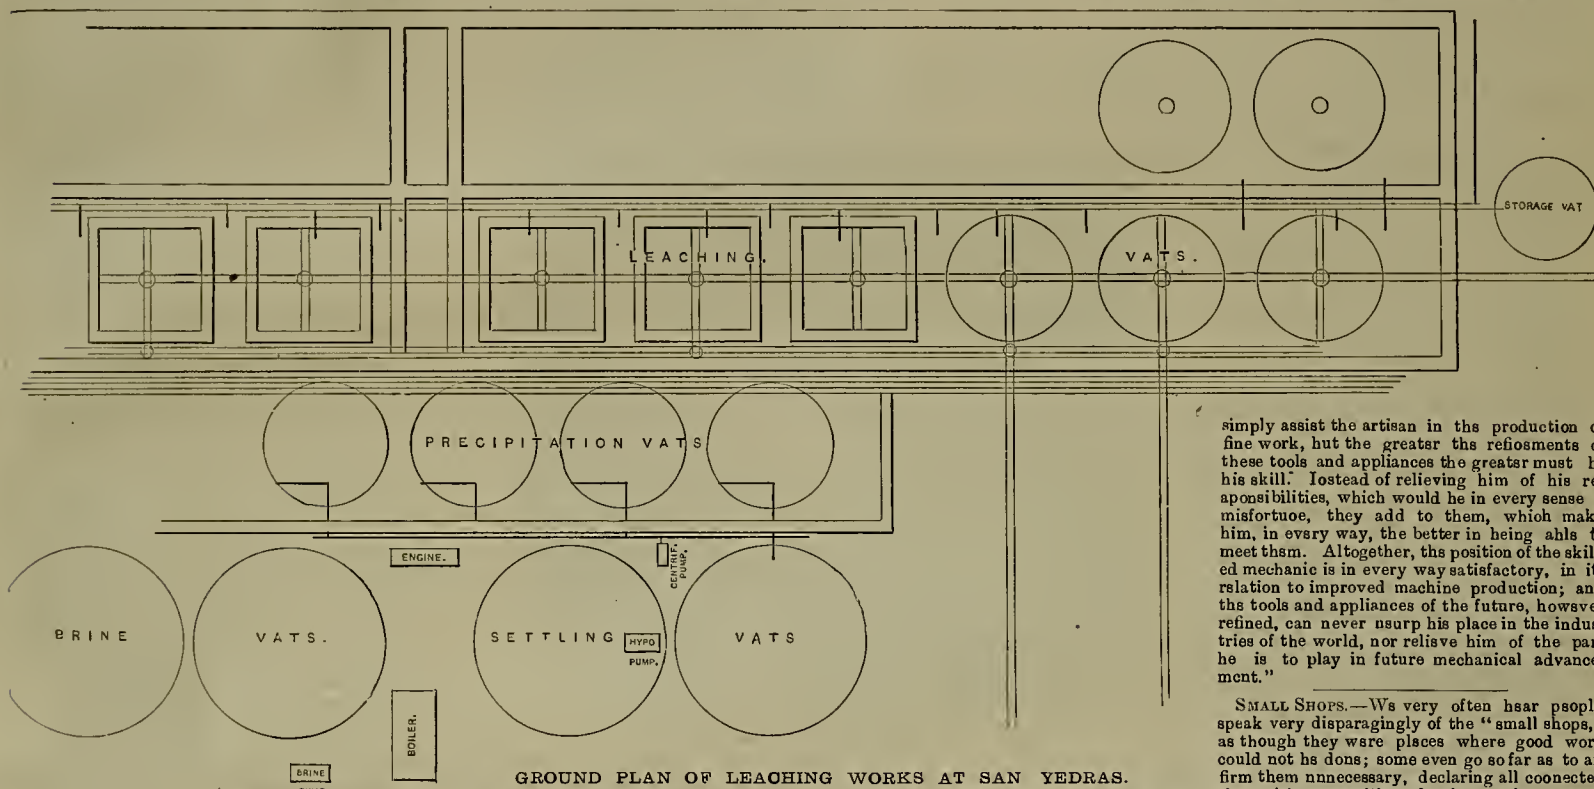

For the purpose of drawing off the hypo after the settling of the precipitate, a hose was first employed with a float attached to its inner end,

after the settling of the precipitate is now quick and easy; to start with, the open end of the pipe is simply lowered a couple inches under the surface of the hypo, to be lowered again when the liquid has sunk correspondingly, and so on until at last the pipe is in a horizontal position three feet above the bottom of vat. The drawing off is now completed and new solution can be run in, not forgetting that the pipe has to be raised before this is done.

The hypo drawn from the precipitation vat in the aforesaid manner flows, before entering the sump, into another horizontal pipe, which extends along the entire length of the vats, so that the four short pieces, one to each vat, which receive the discharge from the swinging pipes, form connections between this long pipe in front and the latter. The renewed and settled hypo does consequently not flow directly into the sump, but is led into this intermediary pipe, which has only one outlet to the settling tanks, namely, another small two-inch pipe, screwed into it at right angles, being an extension of the connection with vat one. In this manner the discharged liquid from precipitation vat No. 4 flows through the entire length of the intermediary pipe before falling into the sump, that from 3 has a shorter distance to run, from 2 still shorter, whereas from 1 it flows right into the sump, this outlet pipe being here the extension of the connection with 1. Valves are placed at each point where a connecting pipe enters the intermediary main, from which, at

Skilled Mechanics.

Speaking of the position and prospects of the skilled workman and mechanic, the *American Machinist* remarks: "No matter to what extent the refinement in machine tools may be carried, it is in the end the careful and painstaking operation of the skilled mechanic that must bring the products of these tools to a perfection that will meet the requirements of modern demands. The latter will not turn so round that, in this respect, its production cannot be improved by the hand work of the skilled machinist, nor will the milling or planing machine produce surfaces so true that he is not called to rectify them with file and scraper. Now, as ever, the beautiful finish on iron and steel is the result of the individual effort of the operator, rather than of the perfection of tools. Years ago, the opinion prevailed to a considerable extent that the services of the highly skilled mechanic would not be so much a matter of necessity in the future as in the past, but those who built such ground built poorly. The man will always be superior to the machine, and must always see better than he can perform. One man may direct the efforts of 50 skilled workmen to the production of good work, but 50 men cannot get good work from one unskilled workman. Improved tools and mechanical appliances will

No. 3 is ready for drawing off and new solution runs into 4.

To ascertain about how much calcium polysulphide is needed,

A Test is Made

Before commencing the precipitation of a filled vat. A glass full of the solution is dipped out for the purpose and the silver in it precipitated with care by adding the reagent in small portions, with good stirring after each addition until the solution is passed, as it is called, or, in other words, till all the silver has been thrown down in the form of insoluble sulphide. With a little practice it is not difficult to ascertain this point; small particles of silver sulphide float on the surface, while the bulk of the black precipitate curdles and sinks quickly down to the bottom of the glass; a drop in excess of the reagent makes the liquid look like diluted milk, and is, moreover, detected by the smell, which is peculiar to sulphuretted hydrogen, but which is not perceptible as long as no excess is present. From the number of drops used in this test and from the mass of precipitate formed, the operator calculates now approximately, and, by the rule of experience, the number of piles which he needs to precipitate the vat in question, avoiding by all means an estimate which should be too high. After pouring in the volume of the calcium polysulphide so determined, the solution is well stirred by two men, and after about 10 minutes a second test is made, to ascertain if enough, or too little, or perhaps too much, of the reagent has been added. For this purpose a glassful is again dipped out and filtered and the filtrate examined as described before. If there is cause of fearing that too much of the reagent has been used (that the solution has been overprecipitated), even the slightest excess that can do harm will be detected by a drop of lead acetate, which produces a lighter or deeper brown color, according to the amount in excess. But if, on the other side, it is shown that more of the precipitant is needed, the second test will also show how much more has to be used, not forgetting in the last estimate the practical rule that a little silver may be left in

so that it could only draw from the surface. But the work of drawing off with this arrangement being too slow, another plan was adopted to solve the problem on hand, which from the nature of the case had to satisfy three distinct conditions:

1. The renewed hypo after settling has to be drawn from the surface, but quicker than this is done with a floating hose.
2. Ample room must be provided in this vat below the point of discharge of hypo, for the accumulating precipitates, which from cleanup to cleanup—about one month time—must have room to settle on the bottom of vat.
3. At the time of the cleanup the precipitate mixed with hypo, having the physical nature of a black slush, has to be pumped to the draining vat.

About three feet above the bottom of each vat and opposite to the inlet in hypo-trough, a 2-inch iron pipe is drawn horizontally through the side, and has a revolving hollow arm attached to its inner end; this horizontal pipe is stationary and cannot turn, but around its inner end the hollow arm can easily be turned in a vertical plane through the volume of the cleared hypo, describing in this movement a quadrant. When this hollow radius is not in use, it is drawn up to a perpendicular position, so that its end stands about six inches above the surface of the filled vat. After precipitation and settling, this arm is let down by degrees, drawing only from the sinking surface and discharging through the horizontal part into the sump or settling tank. By means of an iron rod, which with one end is clamped to the end of the swinging pipe and is provided with a ring at the other, the swinging pipe can be let down and hauled up with ease and held stationary in any required position. For this purpose, and also for walking, a plank is laid across the vat, close to the end of a pipe, when it stands in an upright position and parallel to the place of the circle, which it describes when in use. By slipping the ring of the rod over any one of the line of nails, driven half-way into the side of the plank, the swinging pipe can be held in any required position. The work of drawing off a vat

about the center of its extent, another short pipe starts off to connect with the centrifugal pump. The hypo outlet during the cleanup can be closed by a cap screwed into it. It may not be out of place to point out the practical gains derived from this described arrangement:

1. Hypo as well as precipitate are removed by the same intermediary pipe.
2. Each vat is in independent communication with the clean-up pump, common to all, by opening its valve and closing the others, the aforesaid cap being screwed on.
3. The hypo from all the vats runs into the sump by one outlet common to all.
4. A full vat can be partially drawn off into another one by letting down the swinging pipe of the first a couple inches under the surface and that of the second more, the cap being also screwed on, in which case the hypo from the first will flow into the second. This is of importance in the work of correcting mistakes from overprecipitation, especially if the silver solution on hand, that can be used for rectification, is weak.

The Sump.

Two round settling tanks placed side by side receive the regenerated hypo from the precipitation vats. They communicate by means of a short horizontal pipe so that the liquid stands in both always at the same level, as long as the surface has not sunk below it. Into one of them, the receiver, the hypo runs, first striking a dashboard, which rises and falls with the changing level. Much of the floating precipitate settles on the bottom of these two vats. The hypo-pump, worked by steam as all others, is placed over the second vat and delivered to the storage vat from which the hypo is conducted into the leaching tanks. The bottom of the storage vat is elevated about 10 feet above the top plane of leaching tanks, so that a rapid outflow of the solvent for distribution over the ore is thereby obtained. The hypo-pump works day and night, with very little interruption, to keep up the supply in the storage vat.

A BRANCH of the Topolobampo colony enterprise is being organized at Los Angeles,

simply assist the artisan in the production of fine work, but the greater the refinements of these tools and appliances the greater must be his skill. Instead of relieving him of his responsibilities, which would be in every sense a misfortune, they add to them, which make him, in every way, the better in being able to meet them. Altogether, this position of the skilled mechanic is in every way satisfactory, in its relation to improved machine production; and the tools and appliances of the future, however refined, can never usurp his place in the industries of the world, nor relieve him of the part he is to play in future mechanical advancement."

SMALL SHOPS.—We very often hear people speak very disparagingly of the "small shops," as though they were places where good work could not be done; some even go so far as to affirm them unnecessary, declaring all connected therewith an unmitigated nuisance; but except in those instances, happily extremely rare, where the proprietors of these little foot-power shops, by virtue of low rents and other expenses, take large jobs at a very low price, the small and unpretentious shop or factory is of importance not second to the large ones employing the hundreds of artisans. It is in these little affairs where the most important mechanical and engineering achievements have had their origin. In them the dirty, begreased amateur has worked out some of the most complex problems of the age, though in the great majority of instances the financial results of his toil and skill, money-bags having reaped the reward. Nevertheless, the stubborn facts remain that a great proportion of the most important mechanical discoveries of this marvelous century can trace their origin to this humble and unpretentious source—the cold, damp basement, or the dingy garret containing the little shop. Without the little shop many larger ones would have never been built, and without them very many massive engines would soon have little or nothing to do. All honor to the little shop.

THERE'S NOTHING LIKE LEATHER.—The day will come when the present mode of protecting the foot of the horse will be discovered to be a mistake. Its horny substance was never intended to be pierced by nails. No wonder so many horses fall lame and are perpetually ruined. We were recently shown a horse shod in leather. It struck us as an excellent idea and worthy of adoption. We should not be surprised to learn that leather shoes had superseded shoes of iron. If, however, iron be a necessity, let it be nailed on the leather shoe. Now, shoemakers, please get up a neat set, and show them to all your horse friends. Don't take "no" for an answer; stick to them till you have overcome their prejudices. When you have succeeded, apply to the Society for the Prevention of Cruelty to Animals for a medal, and if they decline to give you one, be content to know that you have done more good than the society in question with all its wealth, Scottish Leather Trader.

SAN FRANCISCO:

Saturday Morning, Jan. 22, 1887.

TABLE OF CONTENTS.

EDITORIALS.—Small Companies in Mining; Jardine's Multiple Punch; Dams in California; The Leaching Process, 49. Passing Events; Time to Look After the Prospects; Experiments with Slimes and Tailings; Annual Mining Review; "Strakes" for Saving Gold, 52. Manufacturing Chemistry; A Remarkable Explosion; The Petrified Forests; New Gre-Crusher; Foundry Notes, 53.

ILLUSTRATIONS.—Jardine's 30-Gang Piano Pump; Dey Stone Dam Used in California, 49. Ground Plan of Leaching Works at San Yedras, 51. A Petrified Tree, near Calistoga, Napa County, 53.

CORRESPONDENCE.—Scripture Misquotations; Theory of Earthquakes; Roasting and Leaching Silver Ores, 50.

MECHANICAL PROGRESS.—American vs. English Chutes; Fuddled Iron Still in Demand; Causes of Broken Rails; Blades of Pocket Knives; Firs from Steam Pipes, 54.

SCIENTIFIC PROGRESS.—Rings as an Index of Tree Age; Effect of the Great Earthquake on the Charleston Railroad; Formation of Fog; The Sun all Right, 54.

ENGINEERING NOTES.—Engineering Advance; To Convey Natural Gas Long Distances, 55.

USEFUL INFORMATION.—Utility of Mineral Wool; Unshed Horses; A Sure Method of Cutting Glass Tubes; Stopping Runaway Horses; A New Railroad Brake; About Putty; Weight of Boiler Iron, 55.

GOOD HEALTH.—How to Resist Cold Weather; Consumption from Cows' Milk; Advice About a Very Bad but Common Practice; A Strange Operation; Cure for a Felon, 55.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 56-57.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 50.

Business Announcements.

Commission Merchants.—H. M. Newhall & Co. Mining Property.—M. C. Moore, Walla Walla, W. T. Information Wanted.—Wm. Glannen, Chicago, Ill. Piano Pump.—J. B. Jardine. Mining Property.—C. F. Blackburn, Howe, Idaho. Clayton Compressor Works.—Brooklyn, N. Y. Amalgamating Plates.—E. G. Denniston.

Passing Events.

The long expected and very welcome rain has come at last in abundance, and has extended all over the State. This has greatly encouraged the miners and farmers who were fearing a "dry year" for California. In the cities, too, it is welcome, for it improves the health of the community by flushing the sewers and generally purifying the atmosphere.

The curious accident to the schooner Parallel, when 40 tons of powder exploded upon her striking the rocks, is referred to elsewhere.

The Legislature this week elected George Hearst, the well-known mining man, U. S. Senator, to represent California for the next six years.

The rain will set the streams and ditches flowing full again in the mining regions, and start work in many localities.

Reports from the quartz mines of the State are very encouraging, for in all directions old mines are being reopened and new ones being developed.

"FATHER" UPCHURCH, the founder of the Ancient Order of United Workmen, now so well known all over the United States, died this week.

The sawing machinery at the Inyo marble quarry is now in operation, and further additions to the plant are being made,

Time to Look After the Prospects.

We have had a good deal to say of late about the gold mines of California—their extent, varied characters, accessibility, richness and the other generally favorable conditions under which they exist. We recur to this subject now with a view to enlarging a little upon a topic heretofore partially considered, viz.: the purchase by investors of undeveloped mines instead of improved and productive properties. We have repeatedly explained how, under the liberal provisions of the laws regulating the disposition of the public mining domain, it becomes possible for the prospector and the miner to take up and hold numerous claims, on which no more work is done than suffices to secure to the locator possessory title to them under the local regulations and general laws. This, as a rule, is all the work these parties do, or ever purpose doing, on these claims, first, because, as a general thing, it is all they are able to do, and secondly, because their object in taking them up was in the first place to simply hold them for sale, and this they do from year to year, performing annually enough work to keep good their possession, and sometimes perhaps a little more.

Now there are in California thousands of vein-mining claims in just this position, and which, having been taken up not for mere speculative purposes, but to sell, may be supposed to possess more or less merit. There is no better judge of mineral indications than the professional prospector or practical miner. So far as surface signs go, his opinion is worth fully as much as that of the schooled mineralogist or the trained expert. When, therefore, he makes and records a location, and afterward thinks it worth while to perform upon it annually \$100 worth of work to keep good his claim to it, we may safely conclude that there is something in it. There is ore there or pretty good evidence of its existence in the neighborhood, to say the least. We never knew a miner to take up a location of a quartz vein and spend \$100 on it without something to warrant it. Such a thing as this, in fact, hardly ever occurs.

Now it is to this class of properties investors should, it seems to us, turn their attention, instead of persisting in their search after productive mines, or "going concerns," as the English term them. A mine well exploited and equipped and earning large net revenues is undoubtedly a good thing to have. But these, wherever we find them, are costly properties, being not always held by parties who wish to sell them at a large sacrifice. They can, in exceptional cases, and sometimes for special reasons, be bought at a bargain, as was explained in these columns not long since. As a rule, however, purchasers must expect to pay for them about all they are worth; our business sense teaches us that this necessarily must be so.

With undeveloped mines, on the other hand, it is quite different. They are on the market. They were located to be sold. The owners are willing to sell them; are, in fact, always on the lookout for buyers. In their present condition they are a source of no income to the owners, nor have the latter the means to bring them into a productive condition. In most cases they are a drain on the slender resources of the miner, and one that he would very often be glad to get rid of. For this and other reasons he is therefore almost always willing to part with his interest in them for a trifling sum—a mere modicum of what a "going concern" would cost.

In buying these prospects there accrue to investors other advantages besides the small amount of purchase-money paid out. Mining is a progressive business. Work can be done cheaper and better this year than it was last. Every year brings with it also other improvements in the shape of perfected machinery, more efficient processes and valuable inventions. Economies of labor and expenditure are all the while being effected, the advantages of which they who have work now to be done or improvements to be made enjoy to the fullest extent. All that has been gained in years past inures to their benefit. A mill put up now is capable of doing more and better work than one put up five years ago. It costs less to sink a shaft or run a tunnel now than it did then. Freight, labor and material are also somewhat cheaper. Hence the investor about to embark in quartz mining may reap a large aggregate of gains if he choose to take a fresh start and do his own

work. Not only so, but being warned he may avoid repeating the mistakes of the past, and which, if made by his predecessors, he will have to pay for. These danger signals, so set for his guidance, will also be worth something to him.

Again, in pursuing the course here suggested, the buyer need not confine himself to the purchase of a single claim, as he would, most likely, have to do were he to buy an already producing mine, but could obtain several prepossessing of this kind, thereby increasing and almost insuring his chances of getting one or more good ones. This is a consideration of moment. As an additional precaution against the occurrence of an ore dearth, it would, in fact, be well for every company to insure an extra claim or two, where this is practicable, and keep exploratory work in progress on the same.

We are fully satisfied that the time has arrived when there should be taken a new departure in the direction here pointed out. Such departure is inevitable, nor can its advent be long delayed. To suppose that these sure sources of wealth, of which we have so many in this State, can continue to be neglected is preposterous, and when they shall be made practically available, as they seem will be, there will ensue such an expansion of quartz mining as we have never dreamed of. When this shall happen there will come an end of hard times in California. New breath will be breathed not only into the business of mining, but also into every other industry in the State. Let it be borne in mind that we have on this coast reached the day of small things, not only in other pursuits, but also in mining. Having gone for the high properties, our capitalists must now go for the little ones as well; we make this point for their especial benefit.

Experiments With Slimes and Tailings.

A series of experiments have recently been made by Dr. J. H. Rae in the direction of an investigation into the influence of electricity as an aid to amalgamation of silver. As a laboratory experiment he has been able to save 95 per cent of the quicksilver in slimes and tailings, and hopes, when working on a large scale, to be able to save 50 to 75 per cent. He tells us, however, that he is not positive yet that his idea will be successful when applied practically. However, the Douglas tailings mill, in Nevada, is putting in a dynamo to furnish an electric current with which to put the matter to a test.

He has thus far made 23 experiments on slimes and tailings from the settlers. Some of the amalgam recovered has been shown to the editors of the PRESS. The slimes carry off a great deal of good silver. The amalgam coming from the slimes he tells us is a finer metal than that recovered from the tailings. A number of millmen have been interested in these experiments. He thinks that by his system the currents of electricity can be applied to any ordinary quartz mill as now constructed. We shall be advised more fully when the experiments at the Douglas mill have been completed. The system is to be applied directly to the mills during the ordinary process. The experiments, so far, have been confined to tailings and slimes taken from the bed of the Carson river, most of it being a gray, dirty, greasy slime.

Annual Mining Review.

We shall publish next week a 24-page edition of the MINING AND SCIENTIFIC PRESS, containing a review of the mining industry for the past year. We publish it late in the month in order to obtain full statistics for the year. We propose not only to give a full account of the mining progress in California, but also the condition of the industry in Nevada, Arizona, New Mexico, Utah, Idaho, Montana, Colorado, Oregon, Washington and Alaska. The review will give, in condensed form, the statistics of production of the mines and some account of the condition of the various camps. We shall publish a larger edition than usual of the PRESS containing this review, intending to send extra copies to the various mining camps all over the coast. A comprehensive review of this great industry, such as we intend to publish, will be useful for reference hereafter, as well as of present interest and value. Those interested in mining should procure copies to mail to those friends who would be likely to appreciate such information.

"Strakes" for Saving Gold.

A few weeks since we gave a description of the old blankst system used in quartz mills in this State for saving gold, before they began to amalgamate in the battery and use silver-plated amalgamating plates. The use of these blankets was probably the development of the old bullock skin for saving gold, much in vogue in South America, and some description of the methods employed there will interest our gold miners. At the famous Merro Velhe mines in Brazil, the slimes and water issuing through the battery screens have added to them a certain amount of clean water, and are then conducted over inclined platforms or sluices about 18 inches wide and from 27 to 35 feet long, with a fall of one inch to the foot. The first 16 feet of these "strakes," as they are called, are covered with bullock skins two feet two inches long, and of the width of the strake, tanned with the hair on them; a series of baize cloths, each two feet ten inches long, are employed below these, which are again followed at the lower end of the arrangement by another series of overlapping skins. A certain quantity of finely divided gold is caught even on the last of these skins, while about 10 per cent of the amount present is carried off in the water.

The skins and strips of baize are removed and washed at intervals during the day and night, and time allowed to intervene between each washing up depending on the nature and richness of the ores treated. In each of the houses erected over the strakes are boxes or tanks in which skins and baize are carefully beaten and washed, and of which these destined for the reception of the most concentrated slimes are divided by partitions into three separate divisions. Into one of them the first three skins from the upper end of the strakes are washed, and into the second is removed the ore collected on skins 4 and 5 of the series, while the third division contains water in which the final washing of skins 1, 2, 3, 4 and 5 is effected after having previously removed the coarser particles in one of the other divisions.

The skins and cloths below No. 5 are washed in the same way, but into separate tanks, from which they are subsequently removed and washed over another series of skins and cloths in order to effect their further concentration. The deposit on the first three skins, known as "head-sand," amounts to about 0.42 of a cubic foot per ten of ore stamped, and contains from 27 to 30 ounces of gold per ton, all of which, with the exception of about one ounce, is in a free state. The sand is sent without further preparation to the amalgamating-house.

This "middle-sand" consists of the deposits collected on the skins Nos. 4 and 5, and contains about 6 ounces of gold to the ton, of which some 16 dwts. only are mechanically combined with particles of pyrites. This sand is further enriched by being washed over another system of strakes.

The deposit taken from the third compartment of the tank in which the upper five skins are finally washed is called "swim-sand," and, being exceedingly fine, could not be safely subjected to concentration, and is consequently sent with the head-sand directly to the amalgamating-house.

All the products caught below the fifth skin are known as "tail-sands," and are, like the middle-sand, concentrated by being washed over a second system of strakes. The apparatus employed for this purpose consists of three strakes, each covered with four skins and seven cloths.

At some of the Brazilian mills the skins and cloths are changed every hour, while at others it is only done once in two hours. Previous to 1854, the strakes above described constituted the only arrangement for the collection of the auriferous materials issuing from the batteries, but in that year some extra strakes were added, as it had long been known that a considerable part of the precious metals passed off in the slimes. These extra strakes are so fixed as to receive the slimes from the lower end of the original ones, after being first diluted by the addition of some clean water, and the sands collected are subjected to amalgamation without further concentration. The saving of gold effected by these additional strakes amounts to about 38 ounces per month.

It may be remarked that straking, on the whole, is considered a cheap and simple process, by which 67 per cent of the gold originally present in the ore is obtained in a highly con-

concentrated state, while the 33 per cent that escapes is in two distinct forms; that is, light, free gold and gold inclosed in the coarser particles of pyrites. The light, free gold generally escapes by floating off, while the pyrites are separated and subjected to another treatment.

Manufacturing Chemistry.

Industrial progress appears in an extraordinary degree in the advance made by applied chemistry during the present century. Scientific research has opened a wide field for the application of many new and valuable compounds, and has also reduced the cost of many chemical products, rendering some hitherto unimportant chemicals convenient and economically available, and enlarging the applications of others already in use. Chemistry has unlocked the treasures of the earth to enrich the soil, to beautify and render complete our homes, to clothe us, to cure or relieve the sick, to preserve health by cleanliness and purification and to supply the means of illumination. The rapidity with which the experimental discoveries of the scientist are adapted to practical purposes is, at times, astonishing to the investigator himself. Beside the utilization of our natural resources, the waste products of manufacture are the constant subject of investigation, and often interesting and valuable products result therefrom. The debt of various branches of art and manufacture to new and improved methods of modern chemistry can hardly be overestimated. Chemical processes and products are, indeed, so intimately associated with nearly all manufactures as to be inseparable, and therefore it becomes a difficult matter to locate accurately the dividing line where manufacturing chemistry ends and purely mechanical operations commence.

If one will look over the ponderous volumes of the Census Reports issued by the Government, he will see much to surprise him in this connection. The advances that have been made of late years in this country are remarkable. Leaving aside the preparations of drugs, pharmaceutical mixtures, etc., there are described the chemical processes connected with manures, soap, candles, glycerine, white lead, colors, products of petroleum, etc. There are chemical processes connected with the manufacture of glucose, soda, phosphates, sulphur and sulphuric acid, potassium bichromate, potash, phosphorus, borax, bromine, nitro-glycerine, and many other things.

New York is, of course, the center of the chemical industry, and San Francisco comes number ten on the list of cities in this country. There are 33 establishments of this class in San Francisco, with a capital of \$2,297,550 employed. Among others may be enumerated the following more prominent substances treated or made in this State: Castor oil, candles, oleic acid soap, hard and soft soap, glycerine, nitro-glycerine, borax, white lead, salts of lead, and sulphuric acid. It is probable that before long soda-salts will be produced in California, as investigations into that subject are being carried on.

A Remarkable Explosion.

The wreck of the schooner *Parallel*, near the Cliff House, last Saturday night, was a remarkable one. The vessel tried three times to get through the Golden Gate and out over the bar, but the heavy sea and light winds compelled her to return and anchor. Finally she got outside, when the incoming tide and heavy sea forced her down on to a lee shore in the night-time. There was no wind, and the crew, fearing disaster, took to the boats and left the vessel. She drifted on to the rocks and began pounding to pieces. While in this condition, 40 tons of giant powder, which formed part of her cargo, exploded, completely destroying the vessel, and shattering the signal station, Cliff House, and other dwellings ashore. Several of the life-saving service men were injured, but none fatally.

Such an occurrence is a remarkable one. Giant powder does not explode by ordinary concussion alone, as has been abundantly proven, by experiment, scores of times. The fact was finally discovered that there was a box of giant powder afloat, too. It must have been that the blows of the vessel on the rocks discharged these caps, which in turn exploded the powder. This is the only theory of the acci-

dent that seems tenable. The only other reason that could well be given would be that repeated blows on a box of the powder had squeezed the nitro-glycerine out of the powder, so that a final blow exploded this, and the whole mass was fired by this explosion of the free nitro-glycerine. Giant powder will stand several heavy blows, but many repeated strokes will force out the nitro-glycerine, which then comes dangerous, as alone it will explode by concussion. When, however, this substance is held by a proper absorbent, as it is in giant powder, the absorbent protects it from explosion, except by special means.

The Petrified Forest.

One of the most interesting natural curiosities in this State is the petrified forest, which is only a few miles from Calistoga, Napa county. The name is somewhat misleading, as the number of trees is not very great and none are standing erect. They are all lying down like that shown in the accompanying engraving, which we take from Major Ben C. Truman's new book describing the Sunset route of the Southern Pacific Company, a beautifully illus-

A PETRIFIED TREE, NEAR CALISTOGA, NAPA COUNTY.

trated volume. The trees in this petrified forest are scattered over an area 500 yards square, and others are found at intervals on the ridge down nearly to the bay, a distance of 25 miles. No branches are found and none of the trunks are long. There are many fragments, and the petrification is complete. The woody fiber has entirely disappeared and has been replaced by a grayish stone that seems to be mainly carbonate of lime, in which the grain of the timber is distinctly preserved. The petrifications split readily with the grain, and numerous splinters lying about resemble wood rather than stone until they are picked up.

All the stone trunks are broken across transversely, some of them in pieces not more than a foot long, on an average, with a squareness of fracture suggesting that after petrification they must have been thrown down. No other explanation will account for the fact that all have numerous transverse breaks, cutting squarely across the trunks, with no appearance of having been crushed. No timber could possibly be broken in such a manner; the breaks must have occurred in the stony condition.

The rock of the ridge is a volcanic sandstone, and was formed by the solidification of wet sand thrown up by a volcano, or washed down from its sides. Such a flood of volcanic sand filled up an ancient forest to a depth of 20 feet or more; the trees rotted away; those parts above the surface of the sand disappeared; those parts below the surface were replaced by stone deposited in water which trickled down; this petrification was harder than the surrounding sandstone, which was washed away; the petrified trunks, left without support, fell down and

were broken into numerous fragments, and there they continue to lie, and to tell of wonderful events that happened thousands of years ago.

The trees were redwood, of the species which still grows in the same vicinity.

Another petrified forest, similar to that near Calistoga, is found in the valley of Cedar Creek, in the northeastern corner of the State.

New Ore-Crusher.

In the ore crusher patented by Frisak A. Huntington, of this city, in August, 1885, he used a loosely rotating cylinder in combination with a stationary jaw, between which and the cylinder the material is crushed. He has improved this construction and has just obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency, and the jaw is now formed with or mounted upon a suitable supporting-base, so as to be either stationary or movable. The face of the jaw is curved, the middle portion being an arc of a circle, described about the center, which forms the fulcrum for the lever or arm, upon the end of which

Foundry Notes.

The Joshua Hendy Machine Works have just finished steel boilers for the fog signal at Point Montara, below Half Moon Bay, to replace those formerly in use. They have also finished steel boilers for the Fog Signal Station at the Point Arena lighthouse, Mendocino county. New boilers and a larger fog signal have been made for the station at Yerba Buena island, in this bay. These contracts were awarded by Capt. A. H. Payson, who is the engineer in charge of the lighthouses and fog signals in this lighthouse district.

Experiments are still being conducted at the North Bloomfield mine in raising gravel by means of a hydraulic elevator. The machine supplied by these works has succeeded in raising gravel 85 feet with a pressure of 425 feet of water. They recently sent a large 20-inch gravel elevator to Elma mills, Siskiyou county, to be ready for the opening of the water season. There are two of them at Golden, Colorado, and for one, new and larger pipe is now being made here, in order to give a larger supply of gravel to the machine, so as to apply its full capacity.

A Cummer engine is being put into the flouring mills at Woodland, Yolo county. Part of its duty will be to run the dynamo for electric lighting. The engine is especially adapted for flour mill and electric-lighting purposes, being steady and uniform as well as economical. These engines have also been supplied to the San Luis Obispo flour mills to run the mill and an electric light dynamo.

We are informed at these works that the business in ore-feeders for quartz mills and in Triumph concentrators has been exceedingly good during the past year and still continues. General business has also been good, and is now even showing some increase.

Extraordinary Copper Production.

Dr. Trippel, superintendent of the Old Dominion Copper Company, at Globe, Arizona, has kindly furnished us the following data in regard to the run of one of their furnaces for the first eight days of the present month, which will be of interest to all copper-producers:

	Tons.
Ore smelted.....	415
Coke consumed.....	53½
Copper produced (running 98 fine).....	81

The above shows an average of 51 tons of ore smelted per day, with a consumption of 12.9 per cent of coke per ton of ore, and the ore averaging 19.5 per cent in copper. The last day's run was 55 tons of ore, producing within a fraction of 12 tons of copper.

The results here given, we may state, are but little above the general average of production from the works mentioned. The above statement is based upon the operation of one 30-ton Pacific water-jacket smelter, made by the Pacific Iron Works of this city, and indicates extraordinary furnace capacity, as well as good management.

With the stimulus of a well-sustained advancing market, many new enterprises of this character are now being inaugurated, as well as many old ones starting up, that under the stress of low prices had been compelled to suspend operations. The many uses to which copper is now applied will undoubtedly insure more remunerative prices to the producers than have prevailed during the past two years and put this great industry upon a more stable footing.

OAKLAND.—This, the second city on the Pacific Coast in size, is now following the example set by lesser places, and intends to let the world know more about it. A special edition of the *Oakland Enquirer*, published under the auspices of the Oakland Board of Trade, will shortly appear. We have been shown advance sheets. When people get this paper the illustrations will give a correct idea of all they see, nothing being exaggerated. The views are made direct from photographs, by the S. F. Photograving Co., of which A. T. Dewey, a resident of Oakland, is manager. There are several dozen engravings which give natural and truthful views, greatly in contrast with the generality of such publications. The paper is fine and heavy and printing well done. Altogether this edition will be creditable in every way, and will soon be completed ready for distribution.

GENERAL WM. B. HAZEN, the Chief Signal Officer of the U. S. Army, is dead.

MECHANICAL PROGRESS.

American vs. English Chains.

Complaints are often made of American-made trace chains, that they break under strains that an English-made chain would safely bear. The *Scientific American*, in allusion to such complaints some time since, said:

The best logging and trace chains are made by hand, each link being formed and welded on the horn of the anvil. They have been made so here for generations, and as the method is the same in foreign countries, and as good iron can be obtained here as there, no sufficient reason exists why American chains are or cannot be as good as others.

A hand-welded chain of tough iron is no better for having come across the ocean. It is possible there is an inferior article of home make which this correspondent purchased; there is little actual value in cheap jewelry. Small, unwelded chains are made by machinery, and some heavy log chains and farm trace chains are called "machine made," the links being bent by machines and the welds being made by belt drops. But these machine-made chains are of less market value than the hand-made chains, being rated at half a cent a pound less than those made by hand.

Some of the largest dealers in logging and farm chains in the Eastern country state that they have few complaints of breakages of American-made chains; they have far more from those of foreign make. The principal fault found with the home-made chain is in the attempt to weld by machine drop instead of by hand, the machine weld showing a good surface from the die but not being reliable. These chains are those which are hand welded. These chains seldom go to the market hurried over with coal tar; but frequently have been "tumbled" and polished so as to show their make. Sometimes too much work is exacted from a chain; when iron is bent and welded, it is not responsible for more tensile strength than one-fourth of that of the rod when tested in a straight line. The fact is, American-made chains are fully equal to those imported; and in many other productions of the hardy metals the American manufacturers lead the foreign producers. In this connection we would give the following description of the new mode of

Casting Chains in Solid Steel.

The description is from a paper read at a recent meeting of the British Iron and Steel Institute by M. Gautier, of France. The process described is that practiced by Messrs. Imbert & Ledger.

In carrying out this process a link which has previously been cast in a vertical position through an iron casting block, which is in two pieces, one of them lying upon the other in a horizontal position. At the end of this block there is a casting hole, used as a head to feed the casting. This part of the mold may be made in sand, in order to keep the steel liquid for a longer period than it would be if cast in iron, should such a course be rendered necessary by the special character of the steel employed. The instantaneous removal from the mold is done through three blocks or taps, which are connected with a shaft having an oscillating movement, depending upon a hand beam. Two of these blocks are so arranged as to act on the two ends of the upper part of the mold, which they can thereby raise, whereas the third block, being connected with the lower part of the mold, can let it down. Thus, by the simple movement of a hand lever the mold may be opened, and the casting is thereby directly liberated so as to cool and shrink. The same result could, of course, be obtained by the use of hydraulic power acting on three cylinders, so arranged as to operate together in two opposite directions.

The finishing of the chain is quite a simple process. Several casting blocks are placed on a revolving turntable, or it may be on a truck rolling on wheels. It is possible to cast several pieces of chain together, each cast adding a link. After the opening of the mold a workman cuts the head off the link, and afterward files the out, if that should be necessary. The links are subsequently placed in a vertical position, and the casting is continued as before. The chain having been completed in this way, it is annealed and hardened in oil, if necessary, after which it is ready to be tested. It appears superfluous to describe the advantages of a process at once so simple and so quickly performed as that which I have just referred to. The process is one that opens up a new field for the successful employment of the highest qualities of steel—such steel as can be trusted to remain solid and without blowholes when cast in chilled molds. Crucible steel generally would be suited to this purpose, and probably also the *mitis* metal, the high manganese steel, and chrome steel. If by this process better chains can be manufactured with a diminished weight of metal, it would manifestly be an important departure, especially for naval purposes.

Puddled Iron Still in Demand.—Notwithstanding the very general use of the modern converters, the puddling furnace is still in use, and its product in demand for many purposes. An Eastern exchange says: We have learned that one prominent concern in Pittsburgh, which has used a large amount of steel, has decided that for some of its products it must return to the use of puddled iron, and they propose erect-

ing in the near future an additional number of puddling furnaces. This by no means indicates that there has been any material check in this movement to substitute steel for iron. It simply indicates what was evident from the first, that experiment was necessary, and an experiment extending over some space of time, to indicate the uses for which steel was especially adapted and the purposes for which it would be wise to continue to use iron. We understand that the railroad companies are not entirely pleased with the success that has been attained in using steel for axles, and a similar statement is true to some extent regarding structural shapes.

Causes of Broken Rails.

A correspondent of a railroad journal in alluding to the frequent occurrence of the breaking of rails says: If railroads were more particular to buy good steel the number of broken rails could be diminished at least one-half. The breaking quality of it could be easily determined by having a few rails of every lot received sent into some yard to be used in switches and on sharp curves. There is nothing that will test the breaking quality like cutting it and snarving it with a big sledge or "Jim Crow." Good steel cuts well and can be curved with a sledge without breaking. Poor steel cuts hard and breaks when the sledge is used in trying to curve it. The sledge should not be used on a rail that is to be put in main track, as the blows weaken the rail; but in a yard, where no bad results come from a broken rail, the sledge is the best and quickest. Another cause of rails breaking is flat wheels under loaded cars. A flat wheel strikes a tremendous blow, one that shakes even the road-bed under the train. It is a traveling sledge-hammer and should not be run in cold weather when frost is in the rails and the road-bed frozen.

Another cause is trying to make a steel rail do service in main track after it is worn out. A steel rail that has given good satisfaction and done service for years under heavy traffic should be taken out when it commences to break at the bolt holes and to furnish an unusual number of broken rails. The rail may have worn smoothly and look good, but the fiber of the rail is gone. It then commences to break at the end where it gets the most jarring. Previous to this stage the splice bar does the breaking at this point.

Another cause for breakage of rails is in using steel rail that is too light under heavy motive power. The higher and heavier a steel rail, the less the breaking.

BLADES OF POCKET-KNIVES.—The blades of very cheap pocket-knives are punched in dies from sheet-steel, but those for first-class pocket cutlery are hand forged, a good workman being able to form 25 to 30 large blades per hour, and about 40 pen blades per hour. There is a pattern and gauge furnished the forger for each sort of blade, but the experienced workman rarely refers to either, his accuracy of eye and skill of hand being sufficient guides to exactness. The blades come from the hand of the smith perfect in form, except the bevel of the back intended to guide engaging blades, this bevel being formed by grinding. The steel used in these fine blades is Wardlaw's (English) or the best American make. As they come from the forges the blades are "choiled" or filled, to make a nick between the blade and the tang, then the blades are tempered, having received the trademark stamp on the tang under a press. The hardening is done in an ordinary coke fire, the operator heating two at a time and plunging them in cold water. The drawing to temper is also done over a coke fire. If the blades are sprung in hardening they are straightened, after tempering, by repeated strokes of a hammer having a thin face like the pene end of the machinist's square hammer, the blows being given on the cave side of the blade, as in the peening of cast iron, and with the same effect, that of stretching the hammered face. The blades are ground on Sheffield and Nova Scotia stones, "glazed" on emery wheels, honed or "set," and finally are polished on wheels of walrus hide fed with rotten-stone.—*Manufacturers' Gazette.*

FIRE FROM STEAM PIPES.—This lurking danger from fire, already quite generally of late alluded to, has been especially brought to the attention of the people of this city by the Fire Underwriters' Inspection Bureau. Attention is called to the danger of fire resulting from steam pipes in contact with wood, and the co-operation of property-owners, architects, builders, and others having such work in charge, is invoked for the purpose of securing a compliance with the order of the supervisors, which provides that "No steam pipes shall be placed closer to wood than three inches, and if such space is objectionable, it shall be protected by a soapstone or earthen ring or tube." The underwriters say, while steam pipes do not directly set fire to wood, that they will reduce wood to charcoal as proved by the finding of several hundred instances in this city, and experiments show that fire results from slow chemical reaction after wood has become charred under conditions liable to be present in any case where steam pipes are in contact with wood. A number of experiments are referred to, showing conclusively that fire results from this chemical reaction, even where the heat to which the wood became charred was subjected was not sufficient to boil water or explode gunpowder.

SCIENTIFIC PROGRESS.

Rings as an Index of Tree Age.

The annual growth or layer is, generally speaking, an index of age in a tree; but this rule has many exceptions, the reason for which is given as follows:

If we place a small section of wood under the microscope, we see cavities with closed walls—cells—everywhere, however they may differ in shape, manner and forms. These, of course, are the units of vegetation and vegetable growth, hence are elements of which every part of the tree consists, and it is this growth and multiplication which makes the growth of the tree; and from the time the embryo sprouts to this last day of its life this continues. The bladder-like cells of which the very embryo consists, multiply in number by the repeated division of each cell into two; when, in all cases, made and provided, the influences which nature provides for this process remain potent and unimpaired. If, on the contrary, these influences are withheld, or from any cause whatever are made impotent, the cell cannot be made to divide itself; hence the formative factor of the tree is maintained and extended, as intended. A tree may keep alive and not grow; all have seen this phenomenon, and many wondered at it.

A maple tree standing near the house of the writer, planted from the seed, was thrifty and vigorous for five years, then became stunted and puny, and in three years afterward was a scrawny, ill-shaped specimen. When it was cut down to make room for the widened street, a section taken from the largest part near the root was placed beneath the microscope, which showed that the tree had four well-defined rings, indicating a healthy, vigorous growth, after which the rings were not clearly defined, but seem to have been composed of a variety of rather number of rings, and such were very plain, giving the precise age of the tree, but if counted in a large tree would easily lead astray.

Digging down to ascertain, if possible, a cause, it was found that each root, rootlet and minutest tendril had stopped short in its growth, and ended in a round, blunt end, indicating that it would have possibly lived a few years longer, these roots and tendrils absorbing barely sufficient to maintain the fabric but not extend it. This establishes the fact conclusively of a non-separation of cells and failure to mark a ring each year. The above is from a correspondent of the *Midland Industrial Gazette*.

Another writer, Mr. R. W. Furras, an agent of the United States Forestry Department, who has given much attention to the age of trees, as indicated by rings, as well as to the period at which trees of different species stop growing and that at which the wood is at its heat, has reached some conclusions of general interest. He says: "Concentric or annual rings, which were once accepted as good, legal evidence, fail except where climate, soil, temperature, humidity and all other surroundings are regular and well balanced. Otherwise they are mere guesswork. The only regions within my knowledge where either rings or measurements were reliable indications are in the secluded, even, and regularly tempered valleys of the Southern Pacific Coast."

Annual measurements of white elm, catalpa, soft maple, sycamore, pig hickory, cottonwood, chestnut, box elder, honey locust, coffee tree, burr and white oak, black walnut, ogee orange, white pine, red cedar, mulberry and yellow willow—19 species—made in South-eastern Nebraska for 25 years, show that "annual growth is very irregular, sometimes scarcely perceptible and again quite large," and this he attributes to the difference in seasons. As trees increase in age, inner rings increase in size, sometimes almost disappearing. Diminished rate of growth after a certain age is the rule. Of four great beeches mentioned by London, there were three, each about 17 feet in girth, whose ages were respectively 60, 102 and 200 years. Mr. Furras found 12 rings in a black locust 6 years old; 21 rings in a shellbark hickory of 12 years, 10 rings in a pig hickory of 6 years, 11 rings in a wild crabapple of 5 years, and only 20 rings in a chestnut oak of 24 years. An American chestnut, only 4 years old, had 9 rings, while a peach of 8 years had only 5 rings.

Dr. A. L. Childs, a resident of Nebraska from 1854 to 1882—27 years—a careful observer for the Smithsonian Institute, who counted the rings on some soft maples 11 years and 2 months old, found on one side of the heart of one of them 40 rings, and not less than 35 anywhere, which were quite distinct when the wood was green, but after it had seasoned only 24 rings could be distinguished. Another expert, Thomas Meehan, editor of the *Gardener's Monthly*, says that all our Northern hardwoods make many rings a year, sometimes as many as 12, but as the last set of cells in a year's growth are very small and the first very large, the annual growth can always be determined except when, from local causes, there is in particular years little or no cell growth. This may give a larger number on one side.

Upon the Pacific Coast of North America, trees do not reach the point where they stop growing nearly as early as those of the Atlantic Coast. About 200 years is the greatest age attained on the eastern side of the continent by trees that retain their vigor, while 500 years is not uncommon in the case of several species of the western coast, and Mr. Meehan is confi-

dent that a *sequoia* which was measured was not less than 2376 years old. At Wrangell, lat. 36° 60', a western hemlock (*abies mertensiana*), six feet in diameter at the stump, was four feet in diameter 132 feet further up the trunk, and its rings showed 432 years. But in the Old Bartram Garden, near Philadelphia, not more than 150 years old, almost all the trees are on the down grade. The *quercus robur*, England's pride, which at home is said to live 1000 years, has grown to full size and died in this garden, and the foreign spruces are following suit. Silver firs planted in 1800 are decaying.

This great difference in the longevity of trees upon the western and eastern coasts of continents in the Northern Hemisphere seems to be due to the warm moist air carried by strong and permanent ocean currents, from the tropics northeasterly, in both the Atlantic and Pacific oceans, which makes the climates both moist and equable even in high latitudes. In Sitka, lat. 57°, as much as 100 inches of rain has fallen in a year, and the harbor is rarely frozen enough to hinder the passage of boats. In some winters, scarcely any ice is seen.

EFFECT OF THE GREAT EARTHQUAKE ON THE CHARLESTON RAILROAD.—Our readers will recollect the derailment of a train of cars on the Charleston railroad during the night of the occurrence of the great earthquake in that region. It was observed the next morning that the rails were bent out of a true line, and that the ties were in some places forced to one side of the track. It was thought and so stated that this bending of the rails in reverse curves was due to the violent oscillation of the ground to the east and west by the earthquake waves. A late correspondent of the *Scientific American*, however, has evidently given the true cause of the bending. He writes: "The true cause, as I believe, is the contraction of the earth crust in settling, to suit inner shrinkage, by reason of radiation and consequent cooling, thus shortening distances and bringing such end thrust on the rails that they are compelled to bend. If lateral oscillations were to bend the rails, they would also bend the roadbed and the sides of the ditches, which, I understand, was not the case. The sliding of the cross-ties to one side of the roadbed shows that the rails moved the ties, and that the cross-ties did not move the rails. Everything goes to show that the end thrust on the rails produced the bends. All agree that the earth does contract, and end thrust is, therefore, a natural consequence." The correspondent further suggests that the space always left between the ends of the rails to allow for expansion in the hot weather of summer may have been so reduced as to lead to other casualties during this coming summer's heat—a timely hint, which should not be suffered to pass unheeded. It has also been noticed that a violent magnetic disturbance followed the earthquake, which was noticed as far north as Rochester, N. Y., where a magnetic needle two feet in length moved over an arc of five degrees.

FORMATION OF FOG.—The experiments of Coulier and Mascart, extended by Aitkin, have demonstrated that in a perfectly moist air no formation of fog is possible, however much the temperature is lowered, so long as the air is absolutely free from dust, and that the more air, sufficient moist, is charged with such foreign particles, the more intense is the formation of fog under a sufficient lowering of the temperature or pressure of the air. Let filtered and completely moist air in a glass ball have its pressure diminished; then will only a few particles of fog reveal themselves to the most careful inspection, even under the powerful light of an electric lamp—particles of fog which, moreover, yield not the slightest colored image. Admit now into this filtered air a few cubic millimeters of ordinary house air, which always contains numerous motes or particles of dust; then will a very fine, silvery, transparent fog at once form itself, of such slight density that, even in the case of considerable area of it, the transparency of the atmosphere would be but very little affected. At the first moment of its formation let a reflected image of the sun, or the reflected light of an electric lamp, be viewed through it; the image will be seen surrounded by an intensely luminous blue or greenish light.

THE SUN ALL RIGHT.—The heat of the sun is not increasing. The researches of the botanist and geologist show that the solar radiation of heat cannot have varied but in a very trifling degree since the most remote geological ages—that is, for millions of years. It is estimated that the measure of the heat of the sun at its surface is 18,000° F., which is five times the highest temperature man can produce artificially—equal, in fact, to what would result from burning a mass of coal (of the best quality) 200 miles broad, 200 miles long and 200 miles high—that is, 8,000,000 cubic miles of coal. This would be about 12,000,000 of millions of tons per second. It will help us to imagine what this means if we consider that the whole output of our exceptionally coal-producing country is but about 150,000,000 of tons per annum. It is calculated that only one 2,331,000,000 part of the sun's heat reaches us, and therefore the whole amount really passes either comprehension or calculation, and it is a vexed question with astronomers as to what becomes of the heat that goes off into space.

ENGINEERING NOTES.

Engineering Advance.

No class of men better than the engineers recognize the fact that all they have done, step by step in the past, has been but "stepping-stones of their dead selves to higher things." What-aver they have designed, projected or builded has been but new platforms upon which to successively mount to finer results, nobler efforts and grander designs.

Of all other pursuits, that of the engineer is the advance of improvement in all which pertains to systematic, perfect work, to beauty of combination, and practical usefulness.

In this we may include the civil engineer, the architect and landscape gardener, as well as the mechanical, the hydraulic and the mining; and there should be a new term to designate a wide departure from all these in mere practice, the designer of grand achievements in bridge, tunnel, grade, curve, or other stupendous work like the ship canal and railways, the immense bridge structures and the mountain railways and hydraulic operations.

The inventor, the worker in metals, in fine material and for fine purposes, is also a designer and an engineer, to whom we owe very much of the grand advance in all industrial, mechanical engineering, and art work of the past few years. America has very little of military engineering. She has a great deal of vigorous, practical application of material to emergencies, but the fine arts of military affairs, fortifications, ships, armament, etc., are still wanting, largely, because circumstances and government regard have not called out to development this wealth of resource and material waiting.

In fact in the fine art of engineering achievement in all directions, we have rather the practical, substantial, useful results, instead of the superlatively fine finish of artistic design which seem to be suggested.

From all the exhibitions in practical industries in Europe and of our own Centennial, America is plainly immensely in advance of the other nations in practical working and in complete results; but there is much naturally suggested when a survey is made of the wide field so prolific in resources.

There is still a want of completeness, a feeling that when capital shall be led to demand it, our inventors, architects and engineers will astonish themselves in the facility with which they outdo all previous efforts in a finer, more perfect, more complete adaptability of design to practical results.

In architectural and structural design of adapting structure to character and purpose, as well as in the clear, fine boldness which gives character to the builder and the object, there seems great room for the invention of the true engineering mind.

In the steam engine in its later habiliments, and in the dynamos and motors, there is suggestion for an immense step in advance in locomotive engineering. The railway has been curbed and restricted by the fear of unappreciated legal enactments and want of dividends, but now that surpluses of \$25,000,000, \$50,000,000 and \$100,000,000 of assets and reserves are at hand to back the engineering skill, there should be a grand advance in the character of our permanent ways, by which the credit and worth of the nation's character are to be judged.

There is the need of the railway, the demand for and the guarantee of its permanence, and there should be the pride, confidence and purpose to make it one of the nation's crowning glories. In sanitary engineering a complete system is yet to be prepared.

Finer effects, more perfect, more complete results are suggested all along the line of inventive and engineering endeavor, and Goethe said long ago that "the desires are but presentiments of dormant powers."—*Chicago Jour.*

TO CONVEY NATURAL GAS LONG DISTANCES.—It has been found a very difficult matter to convey natural gas long distances through pipes. The methods heretofore have been on the principle of forcing the movement by the aid of force-pumps; but it has been found that, as is the case with some animals, there seems to be some inherent principle which renders forcing an extremely difficult matter, and for very long distances absolutely ineffective. In view of this, Col. Roberts, of Pittsburgh, Pa., after some experimenting in this direction, has resorted to the expedient of *coating*. He proposes, instead of forcing the gas, to draw it at low pressure through large conduits by means of exhaust fans at distances varying from 10 to 40 miles, according to the character of the ground to be traversed. These fans, which would be hoxed in the conduit, would be about 16 feet in diameter, and would be driven by engines of about 20-horse power. They would only revolve at the rate of from 30 to 50 times a minute. The patent provides for an alternative method. This is to lay a second pipe under the other one when ascending a hill. This pipe is to be perforated with burners, the heat from which will rarify the gas. At the top of the hill a tank of water will be placed, from which a pipe would be laid over the gas pipe on the descent of the hill. This pipe also will be perforated to discharge a spray over the gas pipe, thus causing a condensation of the gas. This system will cause the main to act as a siphon, and will maintain an even flow over the bill.

USEFUL INFORMATION.

Utility of Mineral Wool.

The use of this peculiar product is rapidly increasing. The special reason of its value for certain purposes—the philosophy of its action in conveying or retarding heat is given as follows: Mineral wool is an excellent non-conductor of heat because it contains a great quantity of air. Air is so subtle and rapid in movement when unconfined, and so slow to convey heat, except by its own motion, that it is at once the very best distributor of heat, and also the greatest barrier to its transmission, according as it has, or has not, freedom to circulate. It is not a matter of surprise that this apparently anomalous state of things is misleading and constantly giving rise to popular errors. That the dimensions of what is called an air-space are entirely arbitrary, no one will deny. It may have a volume of one cubic foot, or it may be the smallest unit of volume into which air is divisible. We are disposed to classify the first class under *climatology*, and the second under *insulation*, for so long as air may circulate at all, it is conveying heat from one place to another; while if it is held in position by any medium, the heat must be conducted—not conveyed. Now, if the air-confining material is not very loose and porous, it will be found to *transmit* heat, and furthermore, the reduction of the percentage of volume of air by making the material more compact, develops its capacity for *conducting* heat. Therefore, so far as theory goes, the poorest conductor of heat is the material which contains the largest percentage of volume of air, and any other view of it is at variance with science and nature.

We find that 192 pounds, or 1 cubic foot, of slag makes 192 pounds, or 11 cubic feet, of ordinary mineral wool, so that the resulting fibers encase 11 times the quantity of air that the slag did; in other words, the cubic foot before conversion contained 100 per cent of material, and after conversion only 9 per cent, therefore the product must contain 91 per cent of its volume of air. In the same way the extra grade is found to have 95 per cent of its volume of air in it, and consequently it is a better non-conductor than the ordinary. It is certain that this proportion of air is not encased by any other product, natural or artificial, which is at the same time indestructible.

The transmission of sound is prevented by a filling of mineral wool, because of its inelasticity or want of solidity. This is a very important feature, because no other material in general use for heat-proofing and fire-proofing possesses also the property of sound-proofing. A fourth advantage, which is of equal value with the others, is the irritation which the glass fibers cause both to insects and vermin. There is nothing in its composition which can help to breed or harbor insects, and no animal life will remain in it.

UNSHOD HORSES.—Mr. P. H. Fagin, a furniture and piano mover at Malden, Mass., gives his experience with barefooted horses. He has driven three horses (two weighing 1100 pounds each and one 1300 pounds) since January, 1885, without shoes. The large horse has always been lame since he bought him 14 years ago, until he took his shoes off. The animal has not gone lame since. He has driven on hard, flint roads, and, of course, on pavements in Boston. The horses travel better than before their shoes were taken off. They are not afraid on slippery pavement as they were with shoes on, and there is no trouble in getting round on any kind of going in the city. Mr. Fagin drove to Shrewsbury, 35 miles from Malden, after two days' rain, in February, 1885, when it was so icy that a boy could skate all the way, and had no trouble. He left home at 7 A. M., arrived at Shrewsbury at 3:40 P. M., and the horses did not slip. The hoof is hard and broad, and the frog is full and plump and on a level. They have driven two winters on ice and snow altogether better than when they were shod. Their feet are better for all purposes, they can trot faster, pull as much and go more miles in the same time than they could when shod.—*Boston Herald.*

A SURE METHOD OF CUTTING GLASS TUBES.—Ernest Beckmann states that glass tubes of any thickness and diameter, as well as funnels, bell-jars, etc., may be safely cut by making a file mark and then building up rings of wet filter paper, 1-2 mm. high, and 2-4 mm. wide on each side of the mark, at a distance of 1-2 mm. The intervening space is then heated in a Bunsen burner flame, or better, by the pointed flame of a blast lamp, while the tube is rotated on its axis. The tube then separates at once in the line between the walls of filter paper. The paper must be saturated with water, must be easily laid on, so that it builds up straight walls, and the thickness to which it is wrapped will depend upon the diameter and thickness of the tube.

STOPPING RUNAWAY HORSES.—The following method of stopping runaway horses would seem to be good, but few horse-owners would care to advertise the vicious character of their animals by such a conspicuous device; neither would the owner of a horse ordinarily safe wish to adopt such a cumbersome contrivance as a regular part of his harness: "Place a cord with a running knot around the horse's neck near the

neck strap. To this slip-noose attach a pair of reins which may be thrown over the dash-board ready to be seized at once. When the horse starts, take up this cord and tighten the horse's throat. The most furious horse thus choked stops instantly and will not fall or kick. This is a Russian discovery."

A NEW RAILROAD BRAKE.—A new railroad brake, called an anchor brake, has been proposed by the *Railroad Gazette*, to be used in cases of emergency. The proposition is to have an anchor to drop from the rear end of train and engage with the ties. Provision for preventing the bending of the ties "under the strain brought upon them" might probably be devised as simply as for the axles; and by having a good long spring to ease the shock when the anchor came to a bearing, in addition to the relief which would come from the draw-springs of the entire train without any expense at all, a train might easily be brought to a stop within 15 or 20 feet from an ordinary passenger speed, if something did not give way.

ABOUT PUTTY.—The best is made of linseed oil and whiting, the latter being simply chalk, ground fine. It comes from the mill with a fine, flinty grit. The adulteration of putty consists generally in mixing soft marble dust with the ground chalk. A superior article of putty for filling cracks, as in carriage and wagon bodies, is made by adding white lead in oil, Japan varnish and a small quantity of turpentine, which makes a hard cement that will not shrink, and which, when dry, can be battered down like pumice-stone or dusted like sand-paper, so smoothly will it cut. Even in the common sorts of putty, it is well to use white lead if a hard putty is wanted.

WEIGHT OF BOILER IRON.—A cubic foot of wrought iron weighs 480 pounds, consequently a piece one foot square and one inch thick weighs one-twelfth of 480 pounds, or 40 pounds, and a plate one foot square and one-sixteenth of an inch thick weighs 2½ pounds. Now, from this, the rule to find the weight per square foot of boiler or sheet iron is to multiply the thickness in sixteenths of an inch by 2½, the result being the weight in pounds per square foot. Example: The iron in a boiler is five-sixteenths inch thick. What is the weight per square foot? $5 \times 2\frac{1}{2} = 12\frac{1}{2}$ pounds, the weight required.

GOOD HEALTH.

How to Resist Cold Weather.

A physician gives the following sensible directions for avoiding colds. Now that the winter is upon us, they will be worth bearing in mind: "To be able to stand cold, one must eat such kinds of food as will give plenty of heat, and must also accustom the system as much as possible to cold. Heat-forming foods are rice, sago, tapioca, potatoes, the grains of wheat, oats, barley, and especially maize. I do not recommend fat, because it is difficult of digestion, but in moderation it is useful. Oatmeal porridge eaten with butter and sugar forms a good cold-resisting breakfast. Then rice, with peas, barley and a little oil or fat, makes a good dinner; while for tea some brown bread, with butter and preserves, will not do. To accustom the body to cold, one must not wrap up too much, but make the body adapt itself as much as possible to the cold. The human system possesses in the brain a center for the government of the heat of the body, by which it is always kept at one uniform height. If we heat our bodies by hot drinks, heaps of clothes, hot rooms, etc., we give this center little to do. But if we expose the body to cold air, take our food nearly cold, and do not clothe too heavily, we keep this in good condition, and it will keep the body warm if we give it the necessary food, and is ready for sudden exposures. The body can be used to cold by means of air baths, or exposing the nude body to the air. This can be done by taking exercise at the same time, and so no cold will be felt. In connection with heaps of clothes, I may say that I have cured two or three weak chests by making the persons throw aside the chest protectors (which are a snare) and sponge the chest daily. When cold do not rush to the fire, but take a sharp run, stamp the feet, and throw the arms across the chest, making the fingers hit the back, like catmen do. Avoid hot fluids, of tea and soups, which give a fleeting feeling of warmth. They are very good if you want to restore a numb person. But if you are not much in the open air, take your food nearly cold, and the system will then supply the required heat, and you will find you can stand the cold much better than if you took hot drinks."—*Ex.*

CONSUMPTION FROM COWS' MILK.—Dr. Hopkins, of this city, a microscopic specialist, by appointment of the Board of Health, claims to have found in the milk of consumptive cows the germs of the disease. He says that the bacillus is long and tube like, and made up of infinitesimal spores, only visible under the most powerful microscope. By his experiments the doctor believes he has shown that, in the case of a cow suffering from consumption, the germs of the disease are to be found in the milk. He believes that the injury done by these germs when taken into the human body depends on the health and delicacy of the organs of the person who drinks the milk. This discovery

having been reported at the late meeting of the San Francisco Microscopical Society, that body appointed a committee consisting of Drs. J. H. Stullard, H. Ferris and the president, Dr. S. M. Mouser, to visit Dr. Hopkins and examine the slides which he has prepared exhibiting these bacilli. The discovery opens a new and important field for investigation, and presents the question whether consumption may not be contracted from the use in diet of milk from cows suffering from pulmonary complaints. The committee will report the result of their visit and inspection at the next meeting of the society.

Advice About a Very Bad but Common Practice.

"Few habits are more prevalent, and none more disgusting, than biting the finger-nails," said a prominent physician the other day. "Cleansing the nails with a penknife and picking the teeth in public are practices vulgar enough, but biting the nails is far worse. It is disgusting in more ways than one. It renders the finger-tips soft, pulpy and shapeless, and destroys the beauty of the nails. Properly cared for, they are an important item in personal adornment. Next to pearly, regular teeth, pink, shapely nails are, perhaps, the most striking indication of neatness and cleanliness. A person with no regard for these little things is pretty sure to be slovenly in other respects; one who munches at his finger-nails as he talks to you may be set down at once, and with slight danger of injustice, as an all-round slattern. Besides, think of the nastiness of it. Dust and dirt of all kinds lodge under the finger-nails. Every article the hand touches contributes its share to the rapidly accumulating deposit of filth. There is no shoe mending matters. The nail deposits are filth of the most offensive and miscellaneous sort. The dirt lodged under the nail soon becomes soft and pasty from the excretion of perspiration. In this form it is bitten off with fragments of the nail, moistened by the saliva, turned over in the mouth, and not infrequently swallowed.

"Did you ever observe a doctor at his ablutions? Invariably he washes his hands first. Then he carefully wipes them and empties and rinses out the bowl before he washes his face. He knows that the bands attract dirt, just as a sponge absorbs moisture, and he has too much respect for his face to bathe it in the same water that has cleansed them. His professional experience has taught him also that poison in the shape of virus from wounds and contagious diseases is often contributed by so simple a process as hand-shaking. He doesn't propose to have his eyes or nose or lips contaminated by his hands in that way. The person who bites his nails is infinitely more liable to that risk, for he takes the concentrated filth from under the nails into his mouth.

"But, worst of all, the nail-biter is a self-devouring cannibal. I wonder how many sentimental school-girls, who keep their fingers in their mouths half the time, and dukes, who nip at their nails as industriously as they suck their cane heads, have ever thought of that. Probably not many of either class. But it is the fact, all the same. When the nails are bitten off, chewed up and revolved in the mouth, as though they were succulent tidbits, it necessarily happens that small particles of the quick are also removed. These particles are human flesh—the nail-biter's own flesh—and they are masticated, frequently swallowed, with the other revolting morsels. Any one who can bite his nails, after that thought, will never suffer from nausea."

A STRANGE OPERATION.—The *Philadelphia Press* gives the following account of the restoration of speech by removing a clot of blood from the brain: Young Gustave Rinsold, who was recently shot in the head, on Nineteenth street, by a comrade, was made the subject of a brilliant operation by Dr. John B. Deaver, demonstrator of anatomy at the University of Pennsylvania, in the presence of his class of students. Rinsold's wound was not looked upon as serious at first. He walked to the hospital, being conscious, and suffering from no paralysis. Yesterday morning his speech was slightly embarrassed. Dr. Deaver was summoned, and pronounced the case to be hemorrhage of that part of the brain which presides over the sense of speech—a clot of blood compressing it. The professor performed the operation by trepanning the wall of the skull and removing the clot of blood, after which the patient could talk as well as before the accident happened. It was considered a wonderful operation.

CURE FOR A FELON.—An exchange gives the following: That woolen smoke is a cure for a felon, is certainly one of the medical discoveries of the age. Could we give the name of the correspondent who sends us the following, it would be at once recognized as of authority sufficient to guarantee the truthfulness of any assertion to which it might be appended: "If you ever endured the agony of a felon, you will appreciate the fact that it can be cured by woolen smoke. Place the woolen rags under an inverted flower-pot, and put coals upon them, or set them on fire in some other way; then hold the felon over the smoke and it will extract all the pain. This has been done by a friend of mine within a week. I assure you that in my circle we consider it as great a discovery as that ether will temporarily deaden pain."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ORIGINAL AMADOR.—*Ledger*, Jan. 15: This old mine of Amador City, which has been abandoned by the formerly English owners for five or six years, has lately fallen into the hands of O. C. Hewitt and T. L. Culbert, who have recently started work upon it. Toward the top of the hill they have struck a ledge of very good quartz, which it is claimed will yield \$8 to \$10 per ton. The ore body is said to be four feet wide. They intend to put up a five-stamp mill at once. W. A. Nevills left Wednesday afternoon to proceed to San Francisco, and from there to New York, en route for England. His business is to dispose of the Moore and other mines in this section to a powerful English syndicate. The Amador Queen M. Co. have offered to compromise the claims of the lien-holders for 25 cents on the dollar. The creditors generally refuse the offer. It is reported that a list of all the mines along the mother lode has recently been forwarded to capitalists in England, who are thinking of investing here. The Downs mine at Volcano has been abandoned, it is believed finally, so far as the present company is concerned. They encountered plenty of quartz, but of too low a grade to pay. The pumping machinery has been taken out.

SUTTER CREEK.—John Tregloan arrived last Thursday night, and at once set to work calculating what was best to be done in starting the Wildman mine. Knight & Co. have secured the contract to put up hoisting works forthwith, also to put in one of their patent hydraulic pumps. Teams are on the road hauling timbers for the hoisting works, and everything will be pushed ahead to get in supplies before the heavy storms set in, if possible. Twenty stamps of the Lincoln mill are running steadily, and will probably be kept going another month. The Mahoney managers give every assurance that the water will be taken out in the spring, and the mine started in full blast.

Calaveras.

SPECIMENS.—*Mountain Echo*, Jan. 15: We were shown some exceedingly rich specimens of quartz the other day. There were three or four pounds of them, and we think they contained at least \$150. Our informant said he had nearly a candle-box full of the same kind of specimens, and several hundred dollars of free gold taken out at the same time. The mine is situated a short distance from this town.

GASTON HILL.—*Calaveras Prospect*, Jan. 14: At the Gaston Hill mine, located between El Dorado and Cave City, three men have been employed, who have sunk a shaft 100 feet. At 70 feet from surface they drifted 75 feet on lead with good results, finding several pockets with very rich ore. Have crushed 75 tons of ore at Rose Hill mine. Have discontinued work on mine until a cleanup is made at the mill.

Contra Costa.

GOLD ON MOUNT DIABLO.—*Martinez Item*, Jan. 18: D. S. Carpenter informs us that parties who have been prospecting on the side of Mount Diablo for the past three months have discovered a well-defined lead of argentiferous quartz, in paying quantities. He accompanied two other gentlemen to the spot a day or two since and collected some specimens that are really fine and assay \$500 to the ton.

El Dorado.

GEORGETOWN.—*Cor. El Dorado Republican*, Jan. 16: The Alpine mine near this place closed down this week. The supposition is that some freeze-out game is being played, as the mine has been prospecting well for several months. The miners in this vicinity held a meeting in Georgetown to-day for the purpose of defeating the C. P. R. Co., who are trying to get a patent for mineral lands in this vicinity. The miners seem confident of success in the coming contest. The several quartz mines in the vicinity of Garden Valley are running full blast. H. A. Wagner and Gilbert Cook, of Bear creek, have struck a fine prospect in quartz near the Bear creek schoolhouse. The ledge is about three feet wide and prospects well in free gold, besides a fine prospect in all the quartz. The Slate Mountain mine is booming along at the usual rate, and it is said that they are getting out some very fine rock from the lower level.

Fresno.

HILDRETH.—*Cor. Fresno Republican*, Jan. 12: "Off to the mines!" is the cry in San Francisco and cities in Fresno county by "suckers" and others in general, who hear of the gold production monthly, thinking that they will stumble over a gold-bearing ledge that will be exposed to the naked eye. But don't come with such expectations as some have, and, above all, don't come broke. Mining men are arriving in numbers, and private conversations are being held with hardy prospectors at every corner of the town, while some very important mining properties are changing hands, and everything in the shape of a gold-bearing ledge is being bargained for at favorable prices. One-half of the James & Francis mine has been sold to some San Francisco mining men for \$30,000, with the agreement that the new owners erect a plant immediately and sink 300 feet, drifting at each 100-foot level. Machinery has already been shipped from San Francisco. This is the mine of the district, the amount of rich ore being enormous. The shaft is down 125 feet, and a crosscut of 40 feet is in high-grade ore. The McNally mine is developing wonderfully. On the 600-foot level there is a four-foot ledge that goes \$50 to the ton of good-mining quartz. The company is sinking to the 1000-foot level, and will run levels at each 100 feet. The company made a big bullion shipment on yesterday's stage which heats all previous ones. The Mountain View mine is about to be sold for \$100,000 to an English company of San Francisco. A number of parties have been trying to get possession of this property, but Pete Donahoo knows when he has a good thing. McNally reports the White Rock mine as looking fine, and the indications are that it will continue so. Twenty-three new ledges were recorded last week in the Hildreth mining records, and still they keep coming in. The Hanover prospectors are jubilant over the size of ore bodies discovered of late. The hills are covered with prospectors, and, judging from the

change of ownership in various claims, quite a boom will be at hand in 30 days. Experts are common, as well as the mine-hunter, and from the work that is being done at all points of the compass upon prospects, the hullion production will surprise the natives next month. Wm. Dunphy will begin sinking upon the Hildreth mine in a few days—as soon as the new pump arrives—with Mr. Wallace as manager.

Mariposa.

BUENA VISTA.—*Gazette*, Jan. 15: Outside of the Buena Vista mine, which has been leased or bonded from Dr. Turner by San Pedro, we have heard of no new developments. We learn that the force of men employed about the mine has been increased, and, to all appearances, things upon the surface about the hoisting works and mill are moving systematically along with a view to having a permanent business. It is greatly to be hoped that Mr. Pedro will meet with success in this new enterprise of developing the Buena Vista mine, as it will not only be a boon to the owner of the mine, who has invested largely, but likewise to a neighborhood of miners and families who have been waiting, and are in a great measure dependent upon the success of this mine. We are informed that Mr. Pedro has been making some inquiry regarding the Cannon or Mexican mine, which is but a short distance from the Buena Vista, and belongs to Capt. Diltz. This has always been looked upon as a valuable mine. Prior owners have made a living from float rock and dirt about the croppings of this vein for years. There is an old shaft some 60 or 70 feet deep, which we are told shows a good vein the entire depth. If Mr. Pedro has any idea of examining this mine the sooner he does so the better, as Capt. Diltz is negotiating with parties for all of his mines. The situation of the Mexican mine is extremely favorable to the Buena Vista mill and mine, and in our opinion would materially strengthen and add great value to the whole property. Then, again, the chances are favorable to the Mexican being as valuable as any mine in that neighborhood. During the past week Capt. Diltz has visited the head of the Malone water ditch for the purpose of ascertaining the quantity of water at this season. He reports that there is plenty of water, if conveyed by pipe, to run 50 stamps successively arranged with an overshot wheel and five stamps at a battery, if constructed according to his plans, of which he has prepared a draft illustrating a most feasible plan for crushing quartz at a cost not exceeding one dollar per ton. The captain says that if water-power cannot be obtained, the crushing of quartz rock by any other process will never be made profitable. There are now visible at the Whitlock and Diltz mines hundreds of thousands of tons of quartz rock, which would yield a handsome profit to a water-power mill. If Capt. Diltz plans for crushing the quartz rock from these mines could be carried out, it would open up a lifetime mining enterprise, one that would be largely remunerative to its owners and increase annually in value. The line which has been surveyed with the view to laying down pipe is something less than 12 miles from its source to the head of Whitlock's creek. The water then can be utilized for a compressor of 50 stamps, besides as many five-stamp batteries as might be thought proper to construct.

Napa.

QUARTZ MILL.—*Independent Callistogian*, Jan. 12: Grishy & Johnson are making preparations to erect a quartz mill on their mining property, and in each of such preparations is the laying of inch-and-a-quarter pipe to supply the stamps. The water will be brought from the vicinity of the "Pallades," and the fall from the source of supply to the mill will be over a thousand feet. The pressure on the lower section when the pipe is closed will be over 400 pounds to the square inch. When necessary this power will be utilized in pumping and keeping the mine free from water, the supply from the pipe, after thus used, being conducted to the mill, where only the water, without the power, is required.

Nevada.

QUARTZ CLAIMS BOUGHT.—*Transcript*, Jan. 14: M. W. Connelly, of Santa Rosa, has purchased at administrator's sale for \$450 the Mt. Hope and Golden Gate quartz claims on a tributary of the south fork of Poorman's creek, Eureka township, which belonged to the estate of Patrick Mulligan, deceased. It was in a quarrel over a water right in the same neighborhood that Mulligan was killed last summer. Mr. Connelly proposes to develop the ledges. He used to be engaged in mining there a good many years ago.

SUITS.—*North San Juan Times*, Jan. 15: Two new suits have been brought against the Milton Mining Company for contempt. Neither of them can be made to stick, because the company was not playing the water against a bank of gravel through a nozzle. They were washing away bedrock which had been gathered and wheeled in a barrow to a point near the sluices. These suits are brought to harass the company, and for nothing else.

WASHINGTON ITEMS.—*Nevada Transcript*, Jan. 15: Last Tuesday a 14-foot ledge of the richest large body of ore ever found in that mine was struck in the 400-level of the Yuba. The quartz had been yielding well for some time, but this discovery is remarkable for its size and character. Superintendent Hare felt so well over the find that he stood the treat for everybody around the mine. There is on the Yuba a 25-stamp mill, but the water-wheel in use gives only sufficient power to run 15. In the spring a new wheel will be put in, so all the stamps can be used. B. J. Watson & Co. are erecting horse-power hoisting works at their quartz claim on Deadhorse Flat, at the head of Canyon creek. They propose to thoroughly prospect the ground, and if the present good indications hold out they will extend the Mayhew road to their property.

THE COE MINE.—*Foothill Tidings*, Jan. 18: This mine closed down a few weeks ago because of the fact that the shaft is of too small dimensions for expeditious working and the machinery not being of sufficient power to handle the water. Since the closing down, surveys have been made to ascertain the feasibility of obtaining sufficient water-power to run machinery that will answer all purposes, including that of a mill. One survey gave 217 feet fall of water, and still another gave 254 feet. It is quite likely that new machinery and a mill will be erected on this property at some future time. The stockholders have great faith in their mine, as the last ore taken out yielded \$20 a load, and the ledge is a large one. A previous crushing yielded \$14 a load,

and with a big ledge and a mine and mill run by water-power, even rock yielding less than \$14 is a pretty good thing.

San Bernardino.

NOTES.—*Calico Print*, Jan. 16: The leaching works and all the mills are running at full capacity. H. G. Tohler has a lease on the Mountain Brow and is taking out some good ore. Last Monday an injunction was served on the chlorides on the Jennie Lind, by Barber, Cook & Co., and work on the property was immediately discontinued. The Harwoods are still at work on Bonanza Hill, as Barber, Cook & Co. do not claim that portion of the hill as a part of the Jennie Lind, but Col. Harwood claims not only the ground he is working so profitably, but also the entire property called by Barber, Cook & Co. the Jennie Lind. John Anderson, a prominent and enterprising business man of San Bernardino, and the principal owner of the Pinto mine, arrived in town last Monday to look after his mining interests. The fine showing of his mine is quite gratifying to him, and he believes that the mine contains ore enough to keep a five-stamp mill running for years, which would yield a handsome profit. It is also his opinion that the establishment of large leaching works would open up a new and prosperous era for Calico. Mr. Anderson's mining interests in the Lava Beds are also increasing in value every year. Last Friday, Soule & Stacy went out to take a look at their mines, the Cleveland and the Midnight, near Fish Ponds, on which Andy Laswell, one of the owners, is now working. They were pleased with the appearance of the property and surprised at the immense body of ore in sight, which has been uncovered at intervals for a distance of 2000 feet. A tunnel has been run into the ledge, uncovering a body of ore 60 feet wide, and there is still ore in the face of the tunnel. The ore consists principally of lead, with a fair percentage of silver. It is a splendid proposition for a smelter. These lead mines and a number of others a short distance from Daggett, would keep a smelter in operation indefinitely. It will not be many months before a smelter will be put up at that station. Last Friday, Perkins, Clark & Settler sent out five men to sink a combination shaft on the Jim Blaine mine, in Five Points district. Last Tuesday, Marcus Pluth and J. Madison left Daggett for Five Points district with 7 men, to sink and drift on the Vienna and London lode. The De Soto mine in the Lava Beds, owned by Eckles, Jordan & Gray, is turning out some very rich ore. Messrs. Eckles and Jordan leave to-day to visit the property, which is under the management of Mr. Gray. Jesse Umbs was in town the other day and stated that the Coffman Bros. are taking out, at a depth of about 100 feet, some good gold rock from the Tip Top mine at Kramer on the Atlantic & Pacific railroad, half-way between Daggett and Mojave. Col. J. S. Loveland left San Francisco last Wednesday, with five men, for Holcomb Valley for the purpose of cleaning out the deep incline in J. B. Osborne's gold mine, in that district, preparatory to the visit of experts, whose report will probably complete the negotiation for the sale of the mine.

San Diego.

AN OLD MINE.—*Santa Ana Standard*, Jan. 16: For years there have been traditional accounts of an old mine in the range of mountains in San Diego county, bordering on the desert, and many prospectors have looked in vain for this mine supposed to be very rich in free gold quartz. In June last a party consisting of C. F. Stamps, Jr., Theo. Staley and T. A. Darling, while in the aforesaid country hunting and recreating found an old shaft about 30 feet deep, together with further evidence of considerable work having been done in that vicinity a great many years ago both in quartz and gulch mining. Samples of the rock were brought in proving to be richer than expected, some specimens assaying over \$400 in gold, and an average test of the rock on the ancient dump showed about \$30 per ton. The ore is free milling, and the ledge well and clearly defined and was traced for nearly a mile on the surface. The parties have taken steps to work the mines in conjunction with the Chilson Brothers, of Anaheim, who have visited the property and pronounced it a very encouraging prospect. Several capitalists of Los Angeles and Pasadena are also interesting themselves, and no doubt the development of these mines will pay to all interested good returns. Wood and water are near by and good roads for wagoning to a point where it would be necessary to locate a millsite. From all accounts we can gather in regard to the matter, this discovery of perhaps a mine that has been worked a hundred years ago by the old Spaniards who first came to California, is likely to create one of the liveliest mining camps on the coast.

Santa Cruz.

GOING FOR GOLD.—*Santa Cruz Courier-Item*, Jan. 16: Gold Gulch, near Felton, is the scene of quite a mining excitement at the present time. About a dozen men were busy last week in different places on the Gulch mining for gold, and we learn that they are making very good wages. During the fall months Mr. E. Foster has been doing some mining work near Gold Gulch. He has had a couple of men employed drifting into the hill, following an eight-inch seam of quartz that gives a good prospect in gold. The tunnel has reached a distance of 115 feet. There has been a gradual widening out of the vein as the work progressed. Mr. Foster informs us that work will be resumed early in the spring and the ledge followed up. In this connection we might say that a number of years ago, in this neighborhood, a detached quartz howler some 18 feet in diameter was found that yielded a large amount of gold. The hole from which the howler was taken is still to be seen and is about 25 feet in diameter and 20 feet deep. A tunnel 1300 feet in length was run into the hill at the time in the hopes of finding a ledge, but with no result.

Shasta.

BULLYCHOOP DISTRICT.—*Cor. Shasta Democrat*, Jan. 12: The Cumberland mill is running day and night on very good ore, crushing about 60 tons per week. Their new ten-stamp mill and hoiler is on the road up here. They expect to throw out the old machinery the last of this month and put in stamps. Superintendent Hart is getting out the timbers and excavating, so by the time the new machinery gets here he can put it in and have it running in about two weeks. He says he will be able then to crush 20 tons a day. A sawmill man was up here this week, selected and located a millsite, and says he will have a sawmill running by the first

of next February. The company has about 30 men employed driving three tunnels and sinking two shafts. The ore runs very even, from \$9 to \$12 a ton, and there is an unlimited amount of it. I candidly think that next summer we will have the liveliest camp there is in Northern California. Davis Bros. & Co. have bonded the Pound Cake mine for \$40,000 to an English company. They have been taking out high-grade ore lately; have tapped at a depth of 174 feet, and found the vein growing wider as it goes down.

IRON MOUNTAIN.—*Shasta Democrat*, Jan. 12: The Iron Mountain Reduction Works will be started up in a few days. Peter Scheerer has bonded his tellurium mine to Mr. A. F. Blood, of Chico, who, it is reported, has interested ex-Governor Geo. C. Perkins with him. Development work on the mine will commence in a few days. The Calumet Mining Company is crushing 20 tons of ore a day. After a 10 days' run, last Saturday, they cleaned up \$1300 without cleaning up the battery. The ore milled is from the mine adjoining the Florida on the west. Assayer De Forrest is acting as receiver in charge of the Texas & Georgia mine in Old Diggings. Since he assumed management the mill was put in running order and the mine worked in a systematic manner. The mill is now turning out bullion.

NEW METHOD.—*Trinity Journal*, Jan. 15: We learn from Mr. W. L. Jackson, now home on a visit, that the Lower Springs Mining and Milling Co., of Shasta county (of which company Captain Atkins is superintendent), have just put up reduction works with a furnace capable of roasting ten tons a day. The ore is first crushed in a Frisbie mill, then run through the reduction works and finally passed through an Americanized arastra. The company owns ten ledges ranging from two to four feet in width and prospecting well.

Sonoma.

MARK WEST COAL MINE.—*Sonoma Democrat*, Jan. 12: Work at King & Hill's coal mine, on Mark West creek, is being diligently prosecuted. The shaft has been opened into the hill for a distance of over 125 feet, and from every indication the prospect for striking the main ledge soon is good. One ledge of about eight inches in thickness has already been passed, and the quality of coal taken from it is far superior to that taken from the surface. It is thought by the engineer of the mine that the main ledge will be struck in a day or two.

Trinity.

HAY FORK QUARTZ.—*Trinity Journal*, Jan. 15: From Mr. C. C. Shattuck, who was in town the first of this week, we learn the following particulars in regard to recent quartz developments in Hay Fork valley: Mr. Shattuck will be remembered as the gentleman who recently purchased the Horsehoe mine from Mr. Farmer; he is also the owner of the Magdaline and is a partner in the Cyclone. A tunnel has been run in on the Horsehoe for a distance of 125 feet, and about 250 tons of ore are on the dump. The outlook for the future of the mine is very favorable. The Magdaline is situated on Kingsbury gulch and the ledge, when first found, was only one-half of an inch in width; however, a tunnel was run in on it about 80 feet and the ledge has widened to a foot. The rock carries free gold and bids fair to develop into a valuable property. A specimen shown us was very rich. The Cyclone, situated on Morgan gulch and owned by Messrs. Carter, Shattuck & Vodge, has a 6-foot ledge, which shows no free gold but prospects well. At the junction of Hay Fork and Carr creeks, Mr. Shattuck has put up a Huntington mill, and quite a little village of 13 houses (needed for the accommodation of the men and the requirements of the work) has sprung up in its vicinity. The mill has a capacity of 15 tons a day and is now running.

NEVADA.

Washoe District.

SAVAGE.—*Virginia Enterprise*, Jan. 15: 500 level—The south drift has been advanced 30 feet. For the last 20 feet of this distance have left the ore on the east side of the drift. 600 level—Shows 12 feet of ore. Now drifting north and south on it. Commenced hoisting ore through the surface last Wednesday through the Bonner shaft. 1640, or Suro tunnel level—The north drift has been advanced and timbered 65 feet; south drift, 40 feet. Both of these drifts are fine bodies of quartz and show good ore. Have extracted about 200 tons of ore from these drifts and delivered the same at the mouth of the Suro tunnel. The new gallow frame at the old Curtis shaft is about completed. Started the machinery yesterday and found the compartments of the shaft in good condition.

HALE AND NORCROSS.—1300 level—The south drift has been extended and timbered 35 feet; total distance, 230 feet. From this drift near the southern boundary two crosscuts have been started, one east, the other west. Each has been advanced about seven feet. 1200 level—The south drift has been extended 34 feet and the north drift 35 feet. East crosscut No. 1 from south drift has been advanced 15 feet; the face is in ore. 600 level—The west drift is now in 260 feet, a distance of 30 feet having been extended during the week.

POTOSI.—Are sinking the south winze on the 250 level. Passed through the ore at a depth of 50 feet and are now in clay. The upraise, same level, has been extended 58 feet. The entire distance is in good ore. Work has been stopped on account of having no room to board the ore. A crosscut has been run through a new ore body on the 250 level, 93 feet south of the Linsley drift, a distance of 48 feet, and not through the ore yet.

BEST AND BELCHER.—600 level—West crosscut No. 1 extended 12 feet; total length, 154 feet. The west crosscut No. 2 that was started at a point in the northwest drift 330 feet from the main north lateral drift has been advanced 32 feet. 800 level—West crosscut No. 4 has been extended 27 feet; total length, 202 feet; porphyry formation in the face. 1500 level—Northwest drift has been extended 27 feet; total, 202 feet; porphyry formation.

SCORPION.—Have finished repairing the machinery and shaft and started opening the new level on the east side of the shaft above the level of the water 300 feet from the surface. The miners are now engaged opening a station at this point.

YELLOW JACKET.—Everything going along smoothly, and the usual quantities of ore are being

shipped from the 1300 and 1400 levels. The old ore breasts and stopes in this mine are seemingly inexhaustible and good, effective exploration work is all the time being done toward the further development of the mine, above and below.

OCCIDENTAL.—Upper tunnel.—The south drift from the north incline winze has been extended 10 feet; total length, 71 feet. East crosscut, same level, has been extended 12 feet; total, 15 feet. North drift, same level, extended 14 feet; total, 31 feet. Extracted 15 tons of low-grade ore. Lower tunnel.—Upraise No. 2 has been extended 17 feet; total length 72 feet.

IOWA.—Both tunnels have made good progress during the week, without any change of importance to report. The upper tunnel is still passing through stringers and bunches of good gold ore.

GOULD AND CURRY.—The south drift from the main west drift, on the 425 level, has been extended 27 feet; total, 476 feet. The east drift has been extended 31 feet; total, 81 feet. The face is in vein matter.

BULLION.—The west drift, 300 level, is in about 50 feet, cut the hanging wall about 45 feet, and the face is now in quartz. The east station is finished, and a drift is being extended that way.

CROWN POINT AND BELCHER.—Extracting daily about 120 tons of ore from the former and 140 tons from the latter. Prospecting work in the upper and lower level of these mines continues.

ALPHEA AND EXCHEQUER.—Prospecting work is being actively prosecuted on the 122 level. A large body of quartz has been cut into. Everything at the new shaft working successfully.

UTAH.—472 level.—The south drift from the main west drift has been extended 36 feet; total length, 152 feet.

CHOLLAR.—The old shaft has been repaired to a depth of 335 feet. Prospecting work has not been commenced yet.

NORTH GOULD AND CURRY.—The work of repairing the shaft continues, excellent progress being made.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, Jan. 16: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Adelphi mine, 3 tons; Dunderberg, 81 tons; Schenck, 6 tons; White Pine, 2 tons; Hoosac, 2 tons; Gen. Lee, 4 tons; Bullwhacker, 5 tons; Hanburg, 24 tons. Eureka Con. Co.—Reveille mine, 3½ tons.

Jefferson District.

CHLORIDERS.—*Belmont Courier*, Jan. 15: The chloriders of Jefferson are taking out very fine ore.

Hawthorne District.

FORKED STICK.—*Esmeralda News*, Jan. 15: The Lapanta Mining Co. sent out from Carson Alex. Hamilton with his forked stick to prospect for water. From the investigation made this expert declares that within a few hundred feet of the famous Lapanta mine, below it on the flat, water can be obtained at a depth of 80 or 100 feet. He also predicts that there are several streams of water in close proximity to town which may be obtained at a depth varying from 75 to 150 feet. From all his investigations he foretells that the largest volume of subterranean water is that which he finds on the flat below the Lapanta mine. If the company, upon his research, take any stock in his seemingly miraculous operations, it will doubtless locate a millsite at the point named and proceed to sink to ascertain the truth of his prophecy.

Manhattan District.

PROMISING.—*Belmont Courier*, Jan. 15: J. H. Sanders and Eli Baker are working a mine in this district that is looking very promising. The ledge is large and carries ore that assays 40 per cent lead and 90 silver per ton. The owners are sanguine that they have a big mine, as it shows better and better as they continue to open it. There are numerous valuable locations in this district unworked at present.

Mount Ross District.

THE CLIFF MINE.—*Silver State*, Jan. 16: Nick Frayer returned yesterday from Spring City and states that 8 miners have been put at work on the Cliff mine, which is situated across the canyon from the Paradise valley, and is supposed to be an extension of the same. The formation at the Cliff mine is similar to that in which the Paradise Valley, Wild Goose and Bullion mines exist, and the ore, too, is said to be of the same character. Nick Frayer ships a lot of ore from the Cliff mine to the Reno Reduction Works to-day.

Silver Star District.

THE MINES.—*Esmeralda News*, Jan. 15: It appears to be the determined purpose of the pioneers of this district to avoid newspaper notoriety. The district is in this county, bounded on the west by Garfield, east by Gillis and Santa Fe districts, and the railroad runs through it. Its principal mines are owned by a corporation organized under the laws of the State of New York, known and called the Western Nevada Copper Co. Its mines are chiefly copper, carrying both gold and silver. The ledges are very large and well defined, upon which in time past considerable work has been done, and, while the property now remains idle, the assessment work for last year having been performed, the company is contemplating starting work this summer, and intend erecting a furnace to reduce its ores. The mines are situated some five miles south of Luning.

Tuscarora District.

TORNADO CONSOLIDATED.—*Times-Review*, Jan. 10: Tunnel extended during the week, 8 feet; quartz hard and flinty. Have started drifts on west lateral vein. This vein has a free quartz giving fair assays in gold (sulphurets).

BELLE ISLE.—During the week, the Belle Isle and Navajo joint crosscut west, 150-foot level, has been extended 22 feet. East crosscut, same level, has been extended 4 feet. Rock continues very hard.

NAVAJO.—No. 2 winze on east lateral, 350-foot level, has been sunk 8 feet. North drift on new vein, 150-foot level, has been extended 16 feet; south drift on west vein No. 2 has been advanced 11 feet.

NEVADA QUEEN.—Slow progress has been made sinking the shaft on account of breaking link on the

engine, causing a loss of three days. Shaft has been sunk 11 feet, total depth 204 feet, and will be pushed on down to the 350-foot level. Water has increased very materially, not so great but what it can be handled easily. West crosscut No. 1 has been advanced 35 feet, all requiring to be timbered.

NORTH BELLE ISLE.—A crosscut has been started on 150-foot level, opposite the shaft; drove 6 feet. South drift from No. 3 crosscut, same level, has been advanced 4 feet. North gangway, 400-foot level, has been driven 39 feet. Rock looks favorable for making good progress.

Union District.

CHANGED HANDS.—*Belmont Courier*, Jan. 15: George W. Veach's series of mines have changed hands and work has been commenced on them. They are considered valuable, and when they were last worked were good bullion producers.

HOPEFUL.—*Belmont Courier*, Jan. 15: Lively times are expected in Union mining district this coming spring and summer. The Alexander mill, Grantsville, is expected to drop stamps about the middle of this month on tailings.

ARIZONA.

PECK.—*Prescott Courier*, Jan. 10: Mr. W. C. Dawes has engaged teams to haul wood to the Peck mill, and hopes soon to have the mine dry and to keep the mill running night and day. He says he is certain to make a fortune out of the mine, and we believe he will. Col. H. A. Bigelow, of Hassayampa district, gives good reports of mining in his section. A letter from Tip Top says that the mill is running; company shipping plenty of silver. Pack trains, with rich ore, arrive in Prescott almost every day from the mines. Banks and assay offices handled \$20,000 in gold and \$37,000 in silver last week.

GOLD ORE.—*Mohave Co. Miner*, Jan. 16: Messrs. Merrill and Flynn are taking out some fine gold ore from the Silver King mine, at Music Mountain, on which they have a lease. H. W. Hitchcock is also taking out ore from another place in the same mine. Messrs. Sample and Shrope had half a carload of Juno ore worked on Tuesday, which netted them a nice little amount. Geo. Mendes also had a half carload, and Bruno Seidel a small lot from the same mine, on which all parties are working on leases. Chas. Cunningham left for the East last night with five tons of ore from the Ellen Jane and Tummanotta mines, Music Mountain district, which he intends to exhibit to the stockholders of the company in Washington. He expects to return with a mill and machinery to work the mines. Messrs. Monaghan and Murphy had a carload of ore from the Black Metal mine worked yesterday, which went away up. This mine is in the Black Metal district, near Aubrey Landing.

NEW CLAIM.—*Thomas Stone Democrat*, Jan. 17: J. P. Cooper and Thomas L. McCracken located a mine near the Emerald on the first of the year, and have been working since that time and are meeting with the greatest of encouragement. They have struck a vein that assays very highly, while the quantity is inexhaustible, being twelve-inch vein. McAllister and McCone are engaged in the construction of a complete hoisting apparatus for Gage and Leach, to be used in working one of their leased mines. A large Worthington compound mine pump has been built for the Copper Queen Con. M. Co., of Bisbee.

COLORADO.

COAL.—*Elk Mountain Pilot*, Jan. 15: The Denver papers have lately been telling the public about the wonderful coal fields around Canyon City, and what wonderful strides is being made in the mining and shipment of the same. In the excitement we wish our Denver contemporaries would not lose sight of the fact that the very best coal in quality not only in the State, but west of Pennsylvania, is mined and shipped right from Crested Butte. It is a well-known fact that three years ago when the C. C. and L. mine was closed down temporarily on account of the explosion there was great difficulty in making schedule time on the fourth division of the Rio Grande railroad. There is no coal in the country to compare with this coal for steam and heating purposes, and the time will come when the great coal supply point of the West will be here or in this vicinity.

MINING AND MILLING.—*Idaho Springs News*, Jan. 16: Robert Turner has taken a lease and bond on the Patten lode, Virginia canyon, and will proceed to open it up. The big pump in the Freeland, which supplanted the smaller ones, is doing satisfactory work. Now that the holidays are over and the miners returned to work, good reports are coming in of new strikes. The sampling works are doing a large business. We learn from good authority that the parties working the Eclipse lode have made a strike of rich mineral. Mr. James Sandidge went to Denver Tuesday, to look up a plant of machinery for the Squirrel gulch properties lately taken hold of by Eastern parties. Fatty Keiffer has been up at the Alice mill, on Fall river, putting in a double tramway from the mine down to the mill, which works splendidly. Capt. Jim Daily, of the famous Joe Reynolds mine on Silver creek, was in town last week ordering timbers for the Red Elephant mines, which have lately been acquired by Mr. Joe Reynolds, of Chicago. The shaft will be timbered from top to bottom, nearly 600 feet, and will be one of the best in the State. Mr. Reynolds always knows a good thing when he sees it, and generally gathers it in. We look for a big output this coming summer.

IDAHO.

WOOD RIVER NOTES.—*News-Miner*, Jan. 12: Camas No. 2 shipped 114 ounces of gold, Tuesday. All the stamps are dropping and mine looking splendid. Capt. Gunn will have stamps dropping on ore from Wolcott about the 20th. Plates are on the way from Chicago, and machinery will be set in motion as soon as they arrive. Minnie Moore resumed shipments on Monday. Mine was shut down to make some repairs on machinery. A full crew is now at work, and two cars per day will be sent out. It is reported that the Noy Aug is under bond for \$50,000. The mine is one of the best on Wood river and has been worked in a systematic manner. There is a good showing of ore and the purchasers will certainly get a good piece of property. Steve

James has ore in the Montana. Snow Fly is producing some nice ore. E. V. Hall and partners have ore in the Comstock mine, near Broadford. Montezuma shows 15 inches of \$150 ore. All the Smoky mines are looking well. King of the West reports six feet of ore. Idaho Democrat has a streak of nice pay ore, but will not ship until spring.

TREASURE-BOX.—*Coeur d'Alene Record*, Jan. 11: On Sunday the Bank of Murray received the product of another week's work at the Treasure-Box, being about 110 ounces and worth \$1600, which the owners assure us was taken out of less than 300 pounds of quartz, all the crushing being done in a single-hand mortar. In this way they have taken out about \$5000 within the last three weeks. Another specimen of quartz, or rather almost solid gold, weighing 22 ounces, may be seen at the Bank of Murray. It is a beautiful piece, worth about \$250. One reads of these marvelous things somewhat suspiciously. Until recently we have felt extremely anxious that capital should come in to develop our mines. This anxiety has entirely ceased. It is coming, and will hasten forward, and cannot be impeded. It is here already in the strong right hands of the prospectors themselves. Now that a single man can pound out from \$1500 to \$2000 in six days, he need be in no greater hurry to get his money out of this mine than he would be from the best banking-house in the world. The Treasure-Box does not stand alone in its marvelous richness. Equally rich specimens have been taken out of the Buckeye Boy and other locations which we are forbidden to mention. Prospectors have more than ever to encourage them to work. So far, every vein or strata which has been followed has shown rapid improvement, and good pay if not great fortune is almost certain to be the reward of well-directed development work.

THE EMMA MINE BONDED.—*I. B. Ferguson*, who owns seven-eighths of the Emma mine, and C. C. Nason, owner of the other one-eighth, have bonded it to John Hackett for \$15,000. Development work is already begun and will be pushed as rapidly as it can be economically. A. R. Thompson has charge of the work. From the date of the discovery of the Emma, it has been considered a valuable prospect, and while the price agreed upon is a nice little raise for Messrs. Ferguson & Nason, it will be unlike all the other prospects which have been proven if it does not turn out ten-fold to the purchaser. The working of this mine is a most encouraging feature to Murray, as its mills will be at farthest, almost within the limits of the town. The mine is located on the divide between Gold Run and Alder gulches, a distance of not more than three-quarters of a mile from the center of town. It will be worked from the Gold Run side, and the mill must, from necessity, come very near.

LITTLE ORE IS SHIPPED.—*Wood River Times*, Jan. 12: All ore shipments are about suspended on Wood River at present, owing to the expiration of the contracts made with the Omaha and Denver Smelting Works. The Philadelphia Co., of Ketchum, is at present the only buyer in this market. This fact has caused heavy producers like the Queen of the Hills to cease shipping until a new understanding can be reached. This will be some time during the present month, doubtless, and shipments will then be resumed.

A FOURTH MILL FOR THE GOLD BELT.—*Ole Rorem* will leave Hailey for the Eastern States, to order a first-class mill for the Donovan group of mines, on the Gold Belt. Mr. Rorem will probably be gone about six weeks. This will make the fourth mill on the Gold Belt before the end of next summer, and as the Tip Top and Deadwood people will doubtless also build a mill before next fall, the Gold Belt will, by that time, be well started.

MONTANA.

RED BLUFFS.—*Inter-Mountain*, Jan. 15: Red Bluffs feels sure of the erection of a quartz mill and perhaps smelting works early in the spring. Some New York capitalists have recently bought two mines there, and will, it is expected, buy others. They state their intention of working the ore in their own works to be built in the vicinity. The ores from the mining districts of the Belt mountains—Neihart, Barker, Wolf creek and Yogo—are described as follows: Neihart, high-grade milling silver; Barker, smelting silver-bearing ores, some being heavy in lead, also large carbonate deposits; Wolf creek, smelting, milling, and free-milling ores of gold, silver, copper and lead; Yogo, free-milling gold-bearing ores. A correspondent says that the Neihart camp is lively and nobody is idle. The Hudson concentrator is about completed. The building is 40x150 feet, capacity 100 tons per 24 hours. It is not stated when it will start up. There is a large gang at work on the flume. The small concentrator is running finely. Some of the ore works to perfection, but some cannot be worked to very good advantage, but the trouble will soon be remedied. Wilson & Wisley have just completed their contract of sawing for the Hudson Company 250,000 feet of lumber. The mines are improving as they are worked.

A PLACER COMPANY.—*Salt Lake Tribune*, Jan. 15: Fifteen years ago, John Snell, the builder, was up in Montana engaged in placer mining, which he left for the purpose of coming here to build the Walker house. While engaged in building in this city during the years since then, he often thought of those placers, but it was not until a short time ago that he went back to prospect. He is now in the city for the purpose of organizing a company, and steps have been taken which will soon bring this about. The placers are on Quartz creek, which empties into the Missoula river, about 50 miles below the town of Missoula, and he describes the gravel to be from 30 to 40 feet thick, with one place about 600 feet long that is three or four times that deep. The gold is described as being in large pieces and nuggets. Messrs. Snell, Lynch, Sprague and Thomas are the promoters of the company soon to be organized, and what was too big a mining operation to undertake 15 years ago will be made now through a strong company.

OTHER PROPERTIES.—A letter received from Montana makes the following reference to mining operations about Bannock: Dr. J. S. Meade & Sons are working a force of 11 men on the Polaris, and have a fine showing of mineral in sight. Since August, 1885, there has been shipped from this mine ore to the value of upward of \$40,000, and there is now on the dump between 1500 and 1600 tons of

ore that will average over 20 ounces of silver per ton. The Kent Mining Co. are working a number of men in the Blue Wing district, with encouraging results. Wm. E. Galigher is there looking after the interests of the company. The Eclipse mine, in Elk Horn district, owned by S. D. Mills, has a showing of high-grade silver and lead ore. Mr. Bemis has good pay in the old Dakota mine, one-half mile below Bannock. The Bannock Consolidated Mining Co. is working a small force on the Shenon group of mines.

THE CHAMBERS SYNDICATE MINES.—*Butte Inter-Mountain*, Jan. 13: Right of way has been secured by the Montana Railway Company for a branch line deflecting from the present Walkerville road a short distance west of Main street and running directly to the Chambers syndicate mines—the Mountain Consolidated, Wake-up-jim, Green Mountain, High Ore, and Modoc. The syndicate is soon to start work on these properties, and the purpose is to ship the ore to Anaconda for treatment. The *Review* says, referring to the matter: In this connection it may be well to state that the Chambers syndicate has acquired control of the new concentrator and stamp mill recently erected by the Anaconda company at this place, or have secured a lease. The new works will be operated separately from the Anaconda smelter. It is generally understood that the recent improvements made by the Anaconda management in the old concentrator, and the addition of a steam stamp, will enable the upper concentrator to furnish all the concentrates that the smelting furnaces can treat. This belief is founded on the increased daily shipments of ore, and on the fact that since the smelter has been started up all the furnaces have been busy all the time except when closed down for necessary repairs.

NEW MEXICO.

KINGSTON AND HERMOSA.—*Socorro Bulletin*, Jan. 15: To Dr. Wm. Driscoll and A. D. Coon, of this city, who have returned from the southern camps, we are indebted for the following data: Hermosa is a live, prosperous and progressive camp. The Palomas Chief is showing up remarkably well, and Richard Mansfield White is dumping pay mineral in a lively way. He is now preparing a shipment for Socorro. The Antelope, Big Tree, Ocean Wave, Eagle, Pelican, Atlantic Cable and Humming Bird, among other properties, are sacking ore for shipment to this city. Most of the boys in camp, however, are confining themselves to development work. The owners of the American Flag and Flagstaff will at once invest \$20,000 in the development of their ten well-known properties. The camp is growing rapidly and is in a fair way of soon taking its place among the standard mineral producers of the Southwest. Tom Dwyer is running the gold mill at Hillsboro successfully.

OREGON.

NUGGET.—*Jacksonville Times*, Jan. 14: Ingram & Baker, of Willow Springs, picked up a nice nugget of gold worth nearly \$30 a few days since. Klippel, Baume & Co. will soon commence crushing quartz from their own ledge. There is already considerable of it on the dump. A. W. Sturges, of Forest creek, has recently bought 2000 feet of hydraulic pipe, manufactured at K. Kubli's establishment, which is now being put in position. At a meeting of the Jacksonville Mining and Milling Co., held at the office of S. J. Day, in this place, yesterday, the following officers were elected: Directors, T. F. McKenzie; J. G. Birdsey, J. T. Roloson, D. L. Curtis and David Cronenmiller; secretary, S. J. Day; treasurer, T. J. Kenney. It was decided to continue work on their tunnel.

UTAH.

PARK NOTES.—*Record*, Jan. 15: Since the last heavy snowstorm mining operations have been seriously retarded. The roads are blocked so that ore shipments have been limited the past week. In a few weeks the large, new shops of the Ontario and Daly companies, next to the Marsac mill, will start up and begin to do all sorts of mechanical work. The motive power will be generated by means of the large turbine water-wheel, and ample surplus power will be at hand to operate the electric light dynamo. Arthur Brown, owner of the Plutus mining claim, near the Crescent dam, has brought suit against the Crescent Co. for \$1000 rental per annum, since October 1, 1885, and for an injunction forbidding the defendants using his ground for a dump and ore-house. The Crescent Co. has brought suit in the Third District Court against the Wasatch Mining Co. to settle some doubts about the purchase of the latter's property by the former company last September, and to adjust the alleged irregularities in the description of the property as named in the deed.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped about 168,000 pounds of first-class ore. For the week just ended the Mackintosh sampler received 351,150 pounds of Ontario and 133,650 pounds of Daly ore; total, 487,800 pounds. On Wednesday there was turned out of the Marsac mill seven bars of Daly bullion, containing 7863 fine ounces of silver. The Ontario shipped 38 bars of bullion, on the 8th inst., containing 22,501.99 fine ounces, and on the 13th the product was 25 bars, containing 14,849.83 fine silver ounces.

REVIEW.—*Salt Lake Tribune*, Jan. 15: The week has been stormy, with quiet business in all mining matters. The receipts for the week aggregated \$194,747.05 in value, of which \$148,596.55 was bullion and \$46,150.50 was ore. The receipts of the previous week were \$125,001.34 in bullion and \$90,780.11 in ore, a total of \$215,781.45. The Ontario product for the week was 25,068 ounces of fine bullion, and \$983.45 of ore sales; a total of \$35,921.25. The Daly produced during the week 15 bars of bullion, 21,446.42 fine ounces, and sold \$6916.27 worth of ore, a total of \$28,362.69. Fine bar receipts of the week were \$46,431.70; base bullion, \$19,700; fine silver bars, \$6500; Dore bars, \$14,389. The Hanauer smelter for the week turned out \$10,095 in bullion. The Stormont sent up, on the 6th, silver bars to the value of \$7755. The Bannock sent down during the week \$8360 in bullion bars. Selected lead to the value of \$5934.65 was received. Ore receipts here during the week were \$23,675.50 by Wells, Fargo & Co.; \$19,160 by McCormick & Co.; \$3315 by T. R. Jones & Co.

WELLS, RUSSELL & CO.,

Mechanics' Mills San Francisco.

Aluminium, "the Metal of the Future."
The Only Treatise in the English Language.

JUST READY.

Aluminium: Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, A. C., Chemist and Practical Metallurgist, Member of the Deutsche Chemische Gesellschaft. Illustrated by 16 engravings. 12mo. 346 pages. Price \$2.50, free of postage to any address in the world. CONTENTS: Part I. History of Aluminium. II. Occurrence of Aluminium in Nature. III. Physical Properties of Aluminium. IV. Chemical Properties of Aluminium. V. Metallurgy of Aluminium. VI. The Manufacture of Sodium. VII. Manufacture of Alumina. VIII. Manufacture of Double Chloride of Aluminium and Sodium. IX. Manufacture of Aluminium at Salindres (Gard). X. Reduction of Aluminium by other Reducing Agents than Sodium. XI. Working of Aluminium. XII. Alloys of Aluminium. Appendix. Addenda. Index.

A circular showing the full table of contents of this volume will be sent free of postage to any one in any part of the world who will furnish us with his address.

HENRY CAREY BAIRD & CO.,

Industrial Publishers, Booksellers and Importers, 310 Walnut St., Philadelphia, Pa., U. S. A.

Applegarth's Ore-Roasting Oven.

Our new ore-oven is the best in the world for separating the base from the precious metals. The furnace is intended to be worked right at the mine itself, where the ore is produced. It uses very little fuel indeed, and is perfectly economical and practical. Royalty for sale

JOHN APPLGARTH,

East Oakland, Alameda Co., Cal.

THE CONSUMERS' COMPANY.

VULCAN B B AND AJAX.

The Best LOW GRADE EXPLOSIVES in the Market.

SUPERIOR TO BLACK OR JUDSON POWDER.

Vulcan Nos. 1, 2 and 3,

The Best NITRO-GLYCERINE POWDERS Manufactured.

SPECIAL INDUCEMENTS IN PRICES.

AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.

218 California Street, San Francisco, Cal.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

- FOR WEEK ENDING JANUARY 4, 1887.
- 355,371.—PATTERN FOR HORSESHOES—J. E. Bingham, Walla Walla, W. T.
 - 355,586.—VENTILATING CARS—Buckley & Koeft, S. F.
 - 355,587.—VENTILATING CARS—Buckley & Koeft, S. F.
 - 355,436.—WIRE CLOTH STRETCHER—P. A. Buell, Stockton, Cal.
 - 355,602.—GOPHER GUN—F. L. Emerson, Brentwood, Cal.
 - 355,493.—CAR AXLE—W. J. Murray, Jolon, Cal.
 - 355,472.—ELECTROLYTE—W. Y. Quinby, S. F.
 - 355,655.—STEAM BOILER—G. H. Sutherland, Walla Walla, W. T.
 - 355,556.—SELF-OILING PULLEY—E. S. Sutton, Snohomish, W. T.

- FOR WEEK ENDING JANUARY 11, 1887.
- 355,904.—WINDOW VENTILATOR—P. Abrahamson, S. F.
 - 355,905.—REVERSIBLE WINDOW SASH—Adelson & Frell, S. F.
 - 355,857.—ANIMAL TRAP—N. C. Boynton, Los Angeles, Cal.
 - 355,679.—DRILLING OR SLOTTING MACHINE—A. F. Brewer, S. F.
 - 355,680.—LATCH—W. B. Cantrell, Portland, Ogn.
 - 355,869.—WINDMILL—S. M. Fulton, Galt, Cal.
 - 355,925.—MACARONI MACHINE—P. Giovannini, S. F.
 - 356,044.—ORE CRUSHER—F. A. Huntington, S. F.
 - 355,937.—LAYING-OUT MACHINE—E. A. Jerome, East Portland, Ogn.
 - 356,045.—FURNACE—H. S. Jory, Salem, Ogn.
 - 355,940.—TRACTION ENGINE—W. L. Leland, Oroville, Cal.
 - 355,791.—ELECTRIC ANNUNCIATOR—Paul Seiler, S. F.
 - 356,014.—ROD PACKING—Small & Warner, Tacoma, W. T.
 - 355,726.—WINDMILL—J. B. Sohn, Visalia, Cal.
 - 355,932.—TELEPHONE TRANSMITTER—J. C. H. Stul, S. F.
 - 355,848.—ROLL FOR ROLLING NAIL PLATES—Geo. T. Walker, Napa, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dawey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACARONI MACHINES.—Philip Giovannini, S. F. No. 325,926. Dated Jan. 11, 1887. This is an apparatus for the manufacture of macaroni and similar pastes. It is a combination of pressure cylinders with pistons, and paste cylinders suspended on trunnions. The machine is operated by water power.

WINDOW OR DOOR VENTILATOR.—Peter Abrahamson, S. F. No. 355,904. Dated Jan. 11, 1887. This invention relates to the class of ventilators for window sashes, transoms, doors, and other similar communications between apartments and the outer air. The object is to provide for the perfect and easy ventilation of apartments through the usual avenues of communication with the exterior and without interfering with the devices, such as windows, transoms, doors, etc., usually controlling said avenues.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday last, President Harkness in the chair. Dr. C. M. Richter, Chas. H. Hinton, N. W. Spaulding and W. T. Biggett were elected to membership, and Walter E. Bryant, the young ornithologist of this city, was proposed.

Dr. H. W. Harkness, the newly elected president, read an inaugural address.

Dr. E. L. Greene read an account of a botanical exploration of Santa Cruz island, off the coast of California.

Dr. H. Bahr read a paper "On Certain Changes in the Flora and Fauna of California Since 1850."

A vote of thanks was passed to the retiring treasurer, E. Ish Brooks, who had filled the office satisfactorily for 19 years. A hearty and unanimous vote of thanks was also passed to the retiring officers and trustees for their faithful and gratuitous services during the past 16 years.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., Jan. 11, \$11,593; Con. Virginia and California, 17, \$97,276; Sierra Buttes (for December) \$35,000; Young America (for December) \$21,000; Moulton, 14, \$14,400; Hanauer, 11, \$890; Bannock, 12, \$3580; Hanauer, 13, \$2090; 14, \$4260; 15, \$4600; Bannock, 16, \$2850; Hanauer, 16, \$7009. The bullion and ore shipments from Salt Lake City for the week ending Jan. 16th, were: 17 cars bullion, 435,572 lbs.; 8 cars lead, 127,070 lbs.; 19 cars silver ore, 576,950 lbs.; 10 cars copper ore, 250,330 lbs.; total, 52 cars, 1,369,822 lbs.

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

There has been no unusual excitement in stocks for the past week, though the transactions are still rather large. Con. California and Virginia is shipping bullion, and a dividend of \$1 is expected shortly. The situation at the middle mines is very encouraging. The prospecting work being done on the 1200 level of the Hale and Norcross shows a decided improvement in the character of the formation, and it looks well.

The old Savage, or, as it is generally termed, the Curtis shaft, is again in successful working condition after a cessation of operations for over four years. Good ore is being extracted from several levels of the mine. In the Potosi, a crosscut that is being run through a new ore body on the 250 level is reported. On the Divide, prospecting work is being actively prosecuted in mines there. A large body of quartz has been cut into the 122 level of the Alpha, and in Gold Hill the usual quantities of ore are being extracted from the Crown Point, Belcher, Yellow Jacket and Kentuck mines.

New York Metal Market.

Telegraphic advices dated Jan. 20th give the following New York prices:

BAR SILVER—\$1.02 3/4 per oz.	
BORAX—5 1/2 @ 6 1/4 c.	
COPPER—LAKE—\$11 1/2.	
IRON—No. 1, \$19.00 @ \$19.50.	
LEAD—\$4.50.	
QUICKSILVER—\$4 @ \$5.00.	
The following is the latest by mail from the "New York Metal Exchange Market Report":	
COPPER—Steady, spot closing at 11.50 @ 11.70.	
Transferable Notices (Lake) issued at 11.55.	
Transferable Notices (Chili Bars) issued at 13.10.	
LEAD—Firm at \$4.39 @ 4.50 spot. Transferable Notices issued at \$4.40.	
TIN—Quiet at \$22.40 @ 22.55. Transferable Notices issued at \$22.75.	
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.60 @ 22.70; Billiton Tin, \$22.75 @ 23.10; Banca Tin, \$22.75 @ 23.50; Baltimore Copper, \$10.75 @ 10.95; Orford Copper, \$10.75 @ 11.00; P. S. C. Copper, \$10.50 @ 11.00; Foreign Lead, \$4.40 @ 4.80; Foreign Spelter, \$4.35 @ 4.75.	
MAKER'S PRICES—At tidewater. 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.00 @ 21.50; No. 2, \$18.50 @ 19.00; Grey Forge, \$17.00 @ 18.00. Hudson River, Grade No. 1, \$20.00 @ 21.00; No. 2, \$18.50 @ 19.00; Grey Forge, \$16.00 @ 16.25. Southern, Grade No. 1, \$19.00 @ 20.50; No. 2, \$18.00 @ 18.50; Grey Forge, \$17.50 @ 17.50.	

HARTSFELD SMELTER.—People at a distance need not get excited over the Hartsfeld smelter being erected here. One would judge, from the reports seen in outside papers, that it was going to revolutionize things. Wait until it runs for some time successfully, then a representative of this paper will look into it and say what merit, if any, there is in the process. Outside papers are reminded that we do not print every letter sent us by the inventor to hoon imaginary schemes.—Idaho Springs (Colo.) News.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requesting to send it, we will demand prompt payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

REMOVAL.—The California Paint Company and O. S. Orrick, manufacturers of the Averill mixed paint, colors in oil, putty, marine paints, etc., have removed to the new brick building No. 22 Jessie St., near First. They are also agents for the Santa Cruz glues and dealers in California and Eastern glues.

The new flint glass works at West Berkeley were destroyed by fire last week, but will be rebuilt at once.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

GUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGLE—Arizona.

Dewey & Co.'s Scientific Press Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in a GREAT NUMBER of INSTANCES, and the smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED AS VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machine EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

\$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), London, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1883; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

Weather Lore.

Owing to the division of the California climate into a wet and a dry season, our people are much given to studying the signs of the weather during one-half of the year to their manifest neglect the other half. During the dry season, which may be said to extend from May to November, there is so little change in the climatic conditions that neither observation nor speculation is much called for, recourse to either being a work of supererogation. During all this season the sun makes his rounds through a cloudless sky, being obscured only by a narrow belt of mist that at a few points along the coast sometimes drifts in from the sea.

In exchanging salutations old Californians do not at this season of the year indulge in remarks on the weather. To do this would by them be considered absurd. Neither do they when going out in the summer carry umbrellas. The people who do this are strangers, and by the same ye may know them.

But as the dry season approaches its close the old resident feels it incumbent upon him to renew his meteorological inquiries and observations. He begins now to note the signs that tend to show the character of the coming winter, such as the increment of water in the creeks and springs, the flight of the wild geese and the movements of the hibernating animals. Has the mast been abundant or otherwise? Is the fur on the rabbit uncommonly thick? Has the squirrel laid in an extra store of nuts, or has the provident woodpecker bored more holes than usual for the reception of the toothsome acorn? Have the migrating birds made early departure for the south, or they that go north come prematurely back to their winter haunts? All this must be inquired into, and that before the advent of the wet season or there has ever as yet fallen a drop of rain. And yet this is only preliminary work; this class of facts when ascertained bearing only on the general character of the winter, as promising to be a wet or a dry one.

Further on, this business of prognosticating the vicissitudes of the weather taxes the resources of the old-time resident more severely. He is now required to foretell what is likely to happen in the immediate future. If the fall and early winter prove drouthy, as they have done this year, then does our ancient weather-sharp, having in mind the exceptionally dry year of 1850-51, assure us that the case is hopeless—we shall have no more rain, save only perhaps a few aggravating showers, until next autumn. If, on the other hand, the humidity is excessive, then does this man of precedents, reverting to "the fall of '49 and the spring of '50," tell us that we shall see an uninterrupted pluvial downpour extending over two or three months at least. All the meteorological phenomena point to it.

But, beside the early resident who reasons from precedent, there is another class of weather-wise folk. There is the man who sees unmistakable signs of drouth in the position of the new moon, which, if it lie on its back with both horns erect, must necessarily catch and retain the rain that otherwise would have fallen to the earth. This appearing to be a reasonable theory, old Timothy Hayseed, also Titus the younger, conclude to hold their crape for the

rise in price bound to come of a satellite situation like that. The theory of a wet moon rests on the above position of the lunar orb being reversed, or at least so far changed that the rain can run out. Then we have the man whose

member and so unsightly object, serves in this a useful purpose.

There he yet other people possessing in greater or less degree these special gifts. The several classes mentioned comprise, how-

THE RELIANCE IRON FRAME PORTABLE BATTERY

limbs are racked with rheumatism and gout, the pains of which, responding to every change of atmosphere, foretell with fearful accuracy the impending storm; and finally, the club-footed wretch, who, crucifying his pedal extremities to fashion, has covered them with corns and bunions, which excrescences act as a perfect barometer, indicating with unerring precision every approaching change of weather; and so the hoop of such person, albeit a troublesome

ever, such of the craft as seem most richly endowed with these occult powers as well as those most deeply versed in weather lore. In conclusion, it may be observed, that it remains for the members of this meteorological school to advise the honest Granger just how much rain he may expect before the present wet season is over. For such information, provided it were correct, they would entitle themselves to the thanks of the entire community.

The Reliance Iron Frame Portable Battery.

From time immemorial the stamp battery has been the recognized standard appliance for crushing quartz ores. From the crude and clumsy device of earlier times, it has been so improved and perfected that it still holds its own against pulverizers and other modern methods. The principal objection urged against the stamp battery is the expense incurred in erection, on account of the millwright work necessary in framing and construction, requiring skilled mechanics, who in many instances have to be sent long distances, involving much time and large expense, even where timber is available for this purpose. In localities where suitable timber cannot be obtained, and it has to be transported long distances, this, in connection with the cost of framing and setting up, makes a very expensive mill. It is little wonder, therefore, under the circumstances, that a substitute for the ordinary wood frame battery has been so eagerly sought for.

The "Reliance Iron Frame Battery," made by the Pacific Iron Works, of this city, and herewith illustrated, is intended to obviate such objections. In general construction it is precisely the same as the most improved form of battery ordinarily set up with woodwork, only that the frame is made of iron, which is practically indestructible in any climate, and has the great advantage of being complete in itself, as also of being transported and set up at far less cost than the wooden frame referred to.

The framework being made in sections is easily transported on mules if necessary, and a mill can be put up ready for operation in a couple of days' time, after foundations have been prepared. Where desired, the mortar can also be made in sections for such conveyance. The mortar block, as will be observed from the cut, is the same as that of an ordinary battery.

As an evidence [of the appreciation of the merits of this mill, it may be stated that more than 100 of them have already been sent out by the firm named, some five or six additional ones having been ordered frequently by parties after using them. They have come more especially into use in Mexico, Central and South America, and other foreign countries where the facilities for procuring suitable timber and having it properly framed are so meager. The many advantages of this mill for such localities as mentioned are apparent. Iron work is much more durable than wood, while the expense of transportation and setting up is greatly reduced. Beside, a timber-frame battery in warm countries is subject to such shrinkage as to materially impair its durability and efficiency. In localities where timber is abundant and facilities for working it ample, this style of battery is often preferred.

Another important feature of this mill is its large crushing capacity, it having a discharge on both ends as well as on both sides; the capacity is thus greatly increased. It is equally effective on gold or silver ores with either wet or dry crushing. The ordinary battery is of 750-pound stamps. A lighter size is made for prospecting purposes with 500-pound stamps.

An Indian died recently at San Diego who was positively known to be 110 years old.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Blackburn District Mines.

Little Lost River Region, Idaho—A New Mining Section of Great Promise.

EDITORS PRESS:—The Blackburn mining district is situated along the east side of Little Lost river, Altnrae county, Idaho. The mountains in the district reach an elevation of about 12,000 feet above sea level.

Geology.

The rocks exposed consist of devonian and silurian limestones, more or less metamorphosed, and primordial quartzites and cambrian schists, with a little porphyry and gneiss.

All of these formations show perfect evidence of having been extensively tilted and dislocated in a most complicated manner, during the repeated upheavals, which has left them greatly disturbed as regards their original horizontal position. Such a condition of things makes good mines possible. The veins were thus fractured by faults and upheavals, and in which we find the present ore bodies and mineral lodes. In the mountain chain or range, included in the Blackburn district, there are three great faults; each of these great faults may be satisfactorily observed near the end of the range, as viewed from the standpoint of Mr. Hawley's ranch, near the sink of Little Lost river. In each of the three faults there are ore veins, and the ore bodies, like the faults, are continuous for miles. The greatest of these great faults is the one on the west; this fault seems to be the "center of upheaval," as may be seen by its exposition of the deepest and oldest rocks, which are here thrown to the surface. In this fault, also, are located the chief mines of the region, viz.: "The Tyndall lode," on which are the following full-size claim extensions: Tyndall, Ingersoll, Silver Queen, Dixie, Daisy Black, Great Northern, Alice, Governor Murray, Combination and others. All of these claims show galena carbonate ores, while some show immense bodies, prominent among which may be mentioned the Ingersoll and Daisy Black.

The Ingersoll Mine.

The outcrop shows ore for 1500 feet, or the entire length. The ore consists of galena, carbonate of lead, both rich in silver; black copper with ruby and native silver. Assays range from a few ounces up to nearly 6000 ounces silver per ton, with a little gold. Ore has been shipped from the Ingersoll to Salt Lake City and to the Viola Smelter, Nicholia, and thence sampled (carload lots) in Salt Lake—"78 oz. silver, 37 per cent lead (surface ore), and later shipment to Viola sampled 107 oz. silver, 41 per cent lead, second class; and 587 oz. silver, 12 per cent lead and 15 per cent copper, first class." The ore varies in width from a few feet to 30 feet the widest, and varies in character, also, from the rich black copper to low grade (but good concentrating) sand carbonates. The vein strikes north and south, (same as the trend of the mountain range) and dips slightly east directly into the mountain. Both walls quartzite—the east or hanging-wall a very light colored, almost white quartzite, more than 95 per cent silica, while the west or footwall is a brown, ferruginous quartzite, about 75 per cent silica. This footwall or brown quartzite carries also a few ounces silver per ton. The Ingersoll mine, according to general indications, is going to prove a great bonanza—the ore being of good grade and a big showing for the amount of work or development.

The Tyndall Mine.

This claim is in exactly the same formation as the Ingersoll, and contains galena carbonate ore assaying as high as 65 per cent lead and from 50 to 250 ounces silver per ton.

The Silver Queen

Shows the same, being an adjoining extension and south of the Ingersoll.

The Dixie Mine

Is of a similar nature and adjoins the Ingersoll on the north, the Dixie ore being a coarser-grained galena than the latter, and not so rich in silver, but a first-class prospect, as there has been very little work done on the Dixie at the point where the ore comes to the surface. It is the same contact as the Ingersoll, and evidently all that is necessary to get plenty of ore is simply "a shaft" to reach it.

The Daisy Black

Has just been patented. The Daisy is an immense galena mine—ore bodies of vast extent. It is to be worked soon, and the several thousand tons of galena now in sight will be shipped to market this season. The Daisy, if properly managed, can be easily made to produce a thousand dollars' worth of ore daily, or with only 25 good miners should turn out \$30,000 a month. The mine is a bonanza to commence with. Some places the ore is 40 feet in width. It has all evidence of proving one of the big mines—ore everywhere, between walls and outside of walls; a mountain of ore! So much galena that the very ground gives off mineral fumes—"smells of mineral!" Mineral on top the ground, all through the ground, the mountain full of it, and float for a half mile down a canyon! Such is the Daisy Black.

The Great Northern and Alice

Claims show also to be a continuation of the

same ore vein; for hundreds of feet there is a galena and carbonate ore cropping out, and the lode stands up strong, wide, and of great promise in these claims. All that is needed is work to make them pay.

The Gov. Murray Mine

Is on the same great contact, and evidently only a question of depth about reaching a good ore body. It is a promising claim. Some carbonates ore shows at places and it all comes from below. Go down on it, Jake, and eventually you will "catch on!"

The Combination Mine

Is the boss "iron racket" of the camp. At 100 feet there is over 40 feet of oxidized iron. This iron looks like a mass of "burnt-up" and melted slag; porous and scoriaceous, spongy and corrugated like unto the hinges of hades. This great body of iron means something else down "thar!" It shows, too, some nice steel galena in the solid parts, and on down you will cut through the "iron cap" into lead and silver by the million!

The Sage Hen Mine

Is evidently a good lead "off the main contact;" it is just below the Daisy Black in the same mountain and evidently has a subterranean connection with the Daisy. The ore is of the same character—steel galena and gray carbonates. A shipment of two carloads from the Sage Hen was recently sent to Omaha. The ore pays a fair dividend.

The Golden Copper Mine

Is another claim off the above contact (Tyndall) and is situated in the cambrian gneiss above mentioned. It is a gold-silver-copper-lead ore, assaying \$15 gold, 60 ounces silver, 40 per cent copper, and 10 per cent lead. Iron silicious gangue; well-defined vein. There are several other good claims in this district which should be mentioned, but for the present the list is concluded. I have to say to the capitalist that, "bargains of great profit may be had in this section—mines that will pay from the very surface—and at prices seldom so low." To the prospector I have to say: "this region is not half examined to date, and it is a promising field in which to find mines, especially silver-lead mines." We have a bountiful supply of timber-wood and water. The climate, the best in Idaho, outside of Boise and Lewiston. We are 60 miles to rail, but a smooth road over a level country, across the lava-fields, Camas or Blackfoot. Freight to railroad only \$10 per ton. Mining information of a personal nature may be had of Chas. F. Blackburn, mining geologist, Howe, Idaho. Mr. Blackburn discovered the first mines on Little Lost river, owns several of the above claims and is well acquainted with the country. The mines above mentioned vary in altitude from 6000 to 7500 feet above the ocean. Very conveniently situated for economic development. Can be worked the year round. Winters usually mild. Very light snows compared with the country both east and west. Taken altogether, we have an exceedingly promising mining region hereabouts, and during the following summer considerable heavy ore will be sent out. I may conclude by saying that a good custom smelter would make lots of money by reducing our lead-silver ore to bullion right here at the mines. It would be a big paying institution. Plenty ore. No facilities lacking except railroad, and that even would not prevent good pay for the smelter.

PICK AND DRILL.

Howe, Idaho, Jan. 19, 1887.

The Starlight Mine, El Dorado County.

EDITORS PRESS:—On Saturday last we set out with a view to visiting some of the principal quartz mines in the vicinity of El Dorado; but, on arriving at the Starlight, a heavy rain began to fall and we concluded to retrace our steps, not, however, before gaining some information respecting this valuable mine. Mr. Geo. E. Black, the efficient superintendent, greeted us cordially, and very kindly furnished us with the following statistics:

The Starlight, owned and operated by the Starlight Mining Co. (Incorporated), is situated in Mud Spring township, on the summit of one of the loftiest peaks in the vicinity, and is about 3½ miles in a southerly direction from the town of El Dorado and one mile west from Log Town. The hoisting works are run by steam-power, and are a model of perfection. The boiler is of 30-horse power capacity, and is laid in cut granite, presenting a very neat and attractive appearance.

The incline, which is on an angle of 37°, is 280 feet deep, from which drifts are run as follows: On the 160-foot level, north 355 feet, and south 200 feet, and on the 270-foot level, 35 feet. The vein has a uniform thickness of about three feet, and is of high-grade ore. The company has another incline about 550 feet north from its present working shaft which is 175 feet deep, from which drifts are run as follows: On the 80-foot level, running south, 100 feet; on the 100-foot level, south, 140 feet; and on the 150-foot level, south, 110 feet. There is about 3000 tons of ore on the several dumps, which, judging from the character and appearance of the ore, must yield its owners a handsome profit. We were also shown some very fine specimens which were rich in free gold. The company contemplates the erection of a mill in the near future.

Green Valley, El Dorado Co., Jan. 17, 1887.

Portable Quartz Mills.

The Need of Small Stamp Batteries.

EDITORS PRESS:—Since you published my communication of general inquiry for the reason that stamp mill manufacturers would not make a portable outfit as well as sawmill manufacturers, I find that my inquiry was misunderstood. I did not mean merely the battery, nor of one of new and untried machines—the small operator cannot afford them, no matter what the price—but the old, reliable lifting stamp. With the stamps must be plates and concentrator, and small pans and settler. All of which can be made portable, as well as dozens of other kinds of machinery.

Given an ore, of which there is a reasonable plenty in this camp, that will assay \$25 to \$40, with sometimes pockets that will multiply those figures 10 to 100 times, but the one that I specially refer to can be relied upon for an average of \$25 per ton. But six tons per day is as much as can be reasonably expected from it without more expense than can be afforded now. Ten to fifteen dollars of that assay is silver, balance gold; the silver lays in carbonates of lead and copper, some as brittle silver in limy quartz; the gold is free and in sulphurets. The mineral comes from the mine in a mixture of quartz, clay and lumps of carbonates and galena. Now without a concentrator, and pans and settler, what are you going to do with it? It can't be shipped, for the freight to the nearest railroad station would cost \$25 per ton. You can't smelt here, because there is not galena enough as yet found in the camp. With \$40,000 a man could build a first-class mill to work it, but the mine wouldn't support such a mill without an expenditure not to be thought of now, and even then it would perhaps raise the cost of mining beyond the limits allowed by present assays.

Now rolls won't work it without drying for the clay in it, and the clay carries fine carbonates as well as free gold. If you work a heavy stamp on it, it pounds the carbonates and brittle silver too fine, and you can't stop them from going out with the tailings. If you run your stamps with a low drop, you won't do any work, only with more battery; more battery costs more money, and if the miner had more money he would quit the business.

What he wants is a small battery of five stamps, say of 450 pounds each; an automatic feeder, a small breaker, battery and apron plates, a concentrator, a couple of small pans, say 36 inch, and a settler, a well-made portable engine and small pump. But all that machinery must be made so that it stands on low foundations to save expensive framing, grades being overcome by bucket elevators. Then the small millman catches his free gold on his plates, his concentrator saves his carbonates and sulphurets, and his pans and settler a goodly percentage of his mineral that he doesn't get, nor can't get, elsewhere.

With such a mill a prospector or two could combine their capital, and their "prospects" would keep it running and running every day, and a very small crew could operate it. It would be, in fact, a bank on which they could draw for capital to open their mines. If they didn't hold out in depth, it could be easily moved to some other locality. In such an event, one would miss those huge monuments to somebody's had judgment that stud our mining camps like ghosts and give had names to good districts.

But write to our best manufacturers, those who have a reputation in their machinery, and they will reply, "We have no patterns for such a mill, but should you desire," etc.; which means when you are rich enough to quit mining come to us and we will sell you a mill that seven times out of ten will be too big for your mine and put you where you will have to commence over again. Now, the road is a long and hard one; what we want is a mill that will make it less "rocky," and not compel us to fly to that refuge, an "Eastern syndicate," which only means a nest of swindlers, pirates and magnified dead beats.

Surely such a little mill can be built, but who will do it?

EUGENE SMITH.

Fort Maginnis, Montana.

Mountain House District, Montana.

EDITORS PRESS:—Noticing a request in the PRESS for items in regard to mining camps, I send you a few brief notes about this and others in the vicinity. This Mountain House district, 15 miles from Thompson, on the road to the Cœur d'Alene mines, was discovered two years ago. The first mines located were found to be antimony, a large amount of the ore in some of the mines being a very pure sulphide of antimony. The antimony mines have been developed but little. The past summer, a Minneapolis company has been erecting a smelter to work those ores, but through mismanagement has not started up, though they expect to next spring. The mines could probably be bought reasonably.

The next discovery was a galena ledge, the Lucky Boh. A shaft was sunk 60 feet and crosscut run which was 14 feet in galena ore. A tunnel started at foot of the hill to drain the shaft 60 feet deeper is in 110 feet, and crosscuts being run both ways, are in now 12 feet each side, of tunnel, and some galena is

found the whole width, with considerable white quartz, in a slate formation.

This fall a new discovery has been made which promises well. It is white quartz, carrying chloride of silver and gold. On the surface it assays as high as 37 ounces silver and \$18 gold per ton. No development as yet; about three feet crevice.

The camp on the south fork of the Cœur d'Alene river, known as the Hunter district, in which is located the town of Mullen, was started two years ago last spring. This Hunter mine was the first located. Then the Evening and Morning, and the Just What and You Like; after which, hundreds of others. The Hunter has been bonded over a year, and last month was sold for \$90,000. The Evening is now under bond for \$45,000, and work is being vigorously prosecuted; the Morning is bonded for \$12,000. These leads are all galena, carrying some high-grade ore, as gray copper and brittle silver. The Just What and You Like have rich chloride ores running from \$200 to \$800 per ton silver, and probably will develop galena, as they are in the belt. There is already considerable inquiry about them. The prospectors in that region are very much excited, and without doubt, next summer, will see a big boom in that district similar to the one the past year in Wardner.

W. J. CLARK.

Mountain House, Thompson Falls, M. T.

Alhambra Mining Camp.

EDITORS PRESS:—Some of the great problems in this particular mineral portion of California are being solved. For 3750 feet along the line of croppings on this belt, from north to south, there is gold. The deepest point so far reached on the vein is 64½ feet, where the ore is charged with free gold, iron, galena and ruby sulphurets. The vein widens from surface from 2 to 6 feet at a depth of 64½ feet on the vein in solid quartz. The walls are slate. This pay chute has been crossed at intervals for a distance of 3750 feet; its dip is to the eastward. This chute of ore is a wonderful discovery and prospects all along its line, never giving out. It is, of course, richer in some places than others. At the south end and middle of the explored part it is immensely rich. On the Alhambra and Atlanta mines, which run parallel, and from every indication extend through the entire mining district, are large, bold croppings, in one place over 100 feet wide. The Atlanta and Alhambra mines have produced bullion in all (to the original owners) \$507,000. This may be considered the greatest chute of free gold ever discovered in El Dorado county. The present anxiety of the original locators to see 100 feet deeper on this chute of ore can better be imagined than described.

The middle mine (the Alhambra) is equipped with a plant of a new five-stamp mill, etc., and is making a profitable showing. It has produced over \$30,000 free gold. The sulphurets contained in the quartz are not saved. On the south of Alhambra mine is the Atlanta G. and S. M. Co., better known as the Big Blue ledge. In the years of 1866-7 upward of \$488,000 was taken out of shafts Nos. 1, 2, 3, 4 and 5, at a depth of 30 to 40 feet, and from drift running south 200 feet and drift running north 40 feet from No. 5 shaft.

The Alhambra mine was located in 1883, the middle location on the pay chute. A shaft was sunk 29 feet. A block of ground 23 feet in width was mined out. The ore was milled and assayed, and the richest quartz shipped to Professor Price, of San Francisco, which yielded—the block of ground—\$27,600. From September to December, 1886, new parties commenced operations by sinking one of the old shafts down to 64½ feet and have struck rich ore six feet in width, the richest part of the vein lying next to the hanging-wall, and the gold spattered in the slatewall.

This portion of the ledge assays high. The average of the entire body of ore has not yet been determined. There are some 60 tons of quartz on the dump. The present owner is at a loss to know how to treat this particular ore, as sulphurets predominate.

The latest improvements and facilities for saving the most profitable part of the vein are not on the property. This new find is a "paralyzer" to the new party. All the mines are covered with pines, said to be the finest belt of timber land in El Dorado county.

Recently the people of Placerville have made a request to the Southern Pacific Company to extend its line from Shingle Springs to their town. Negotiations are now in progress for the construction of the line. This new camp is situated 8½ miles northeast of Placerville, 4½ miles south of Georgetown, 1½ miles east of the Gopher mine, purchased recently by an English syndicate, and which is being worked on a large scale. It is 2 miles northeast of the Saint Lawrence mine, 2½ miles northeast of Kelsey diggings, originally discovered and owned by J. W. Marshall. It is 7½ miles northeast of the Church Union mine. This shows conclusively that it is the same continuous rich belt of mineral.

James Wilson Marshall, the discoverer of gold in California, was one of the discoverers of this gold belt in the year 1866, and it was wrongly wrested from him by a corporation, assessing him on his stock to the tune of \$20 per share. The story is that these quartz mines are some of the rich finds disclosed by Mr. Marshall to a

lot of sharpers in the early days of the quartz boom in El Dorado county.

The company incorporated on the Big Blue ledge, now known as the Atlanta, and floated the stock at \$10 and \$20 per share. Then the mine was abandoned by the manipulators. This group of mines lies the farthest east on the belt in El Dorado county. The first mine to commence operations has been self-supporting, and paid the cost of mill, etc., and over \$20,000 in profits to discoverers. With the prospect of a railroad passing in sight of mines in the near future, this new camp should have some consideration.

Kelsey District, El Dorado Co., Cal.

Theory of Earthquakes.

EDITORS PRESS:—I concluded a former article in review of Major Powell's essay on the theory of earthquakes, showing by a conclusive argument that if his theory of the cause of earthquakes were correct there could not by any possibility ever be any volcanoes. I now propose to show that his theory concerning the structural condition of the earth is contradictory and fallacious. To make this clearly appear, it is necessary for me to quote verbatim a section of his essay, as follows: "It is a well-known fact that cooling is a shrinking process. The earth is therefore shrinking, by reason of the great cooling which it is undergoing. The interior of the earth globe does not cool at the same rate as the exterior. The temperature at the surface of the earth remains practically constant, being regulated and controlled by the heat received from the sun, by the heat radiated into space and by the conservative influence of the atmosphere. The influence of this control is not confined to the surface, but extends downward with gradual diminution, and the exterior shell is thus prevented from cooling and contracting at the same rate as the interior. As the interior diminishes in volume it shrinks away from the exterior shell, which must then support itself as a hollow sphere if it continues to retain its size. This it cannot do, as the strength of the materials of which it is composed is insufficient to resist the enormous gravity of its own rocks. The shell by its own weight is forced to yield. In this manner displacement originates. The weight of the crust breaks it down, so the interior heated mass contracts with cooling." In the foregoing passage Major Powell begins with a misstatement. It is not a universal fact that "cooling is a shrinking process," as, for instance, water is considerably enlarged in volume when cooled to a degree sufficient to form ice. In order to hold the ground of his reasoning he must specify when, and how cause why, there occurred such change as to make the interior of the earth cool faster than the surface; for by his theory there should at some time have been such change. Otherwise the condensation by cooling would have begun in the interior, and proceeded thence to the surface, leaving it the last portion to become solidified. In another place he says: "Faults are very common in geologic formations. Sometimes a district of country is broken into irregular blocks by them." The area of such a block may be 1 square mile, 10 square miles, 100 square miles, 1000 square miles, or 10,000 square miles.

He gives an instance. He says: "The Sierra Nevada is a great block, 50 to 70 miles in width, and more than 500 miles in length, which relatively to the adjacent country on every hand has been uplifted." On the eastern side it has been uplifted from 12,000 to 20,000 feet for a distance of more than 500 miles. Along the line of uplift the rocks have been severed from the adjacent rocks on the east by faulting and by flexure." Major Powell assumes in his theory that a constant vacuum, or, at least, a constant vacuous tendency, exists between the soft interior and solid shell of the earth. Under such conditions there could not occur an uplifting of any portion of the shell except such as might result from a cramping process. It is utterly impossible of conception how a rocky sheet or plate (for such it must be regarded, as he limits the thickness of the earth's crust to about 20 miles) of such size as the Sierra should become entirely severed from the surrounding portions of the crust, and be bodily uplifted by a contractile elevation produced in that manner must of necessity appear in a pyramidal or ridged form. Every known fact of natural science tends to corroborate the idea that the main body of the earth, from center to circumference, is, at this time, composed of solid substance. The primary cause of earthquakes must ever remain a speculative question, impossible of positive solution; and the existing configuration of the earth's surface has been produced mainly by the action of wind and water during the occurrence of a universal deluge; changed and modified somewhat by the action of the same forces during and since the recession of the waters. All the visible effects of convulsive or disruptive action are, comparatively, insignificant.

JUSTIN CHENOWETH.

SOME enthusiastic but ignorant prospectors have been jumping patented mines up in Montana. That is no worse, however, than has been done in California, where people have "relocated" hoisting works and mills on mines they thought had neglected assessment work.

Lower Springs Mining District.

EDITORS PRESS:—Since capital has taken hold of the mines here, more particularly the Muchmore mine, considerable excitement prevails. Every miner that has a ledge or claim within 10 miles of the Gem, of course has the continuation of the Gem lode. Parties left here last summer disgusted with the camp, but since capital has taken hold of the Muchmore property, they imagine all ledges are equal to the Gem! But such is not the case, as there are but few good ledges in any mining belt. The Gem is supposed to be the true fissure vein of this country. Some mine-holders here are valuing their property too high. In some there is very little in sight to indicate a mine, and

GUTENBERGER'S ROLLER ORE CRUSHER AND GRINDER.

they never will have a mine; but others have splendid prospects.

The Eureka Mine

Being the west extension of the Gem, is advancing its tunnel rapidly toward the old shaft which was sunk many years ago. Some very fine ore has been taken out in the tunnel which runs along on the ledge. The company has about 150 feet to run yet before getting directly under the shaft. Here at this particular place they expect to find still better ore than yet encountered—a pay chute that will be second to the Gem. Every indication is favorable for this. There is little doubt that this will make a mine. The hanging-wall is porphyry, and footwall more of a serpentine rock. Plenty of clay on each wall.

The Little Winnie Mine

Is located on the west end of the Eureka. It is supposed to be the same ledge as the Eureka and the Gem. The Gem lode can be traced distinctly for over two miles in an easterly and westerly direction. This Winnie mine produces some very fine ore, and promises to be of considerable importance. This lode has a direct course to the town of Shasta, and may be found still further on.

The White Oak and Eastern Star

Are showing good prospects. These mines will be valuable some of these days, as they prospect well in so many different places. The ledge are strong and in the same belt as the Gem lode.

Lower Springs, Shasta Co., Cal., Jan. 16, 1887.

Timbering Stopes With Square Sets.

EDITORS PRESS:—Until recently the general public, and also the writer of this, supposed that Mr. Philip Deidesheimer was the originator or inventor of timbering stopes in mines with "square sets." I am not aware that Mr. Deidesheimer ever disclaimed the credit given him surreptitiously, and it is but justice to place the credit where it actually belongs.

In the fall of 1861, Messrs. Thomee Reeder and A. E. Smith, then working in the carpenter department of the Ophir mine, originated and perfected the system now in vogue. Mr. Deidesheimer was manager, and Captain Wm. Dall mine and mill superintendent of the Ophir at the time.

F. STETCHEL.

San Francisco, Jan. 14, 1887.

MEXICAN MINES.—From the year 1537 to 1821, while Mexico was a Spanish colony, the total value of her gold, silver and copper coinage was \$2,151,581,960. During her independence, say 1822 to 1872, \$809,655,921. From 1872 to June 30th last, \$326,639,693, or a total coinage since her mints were established of \$3,287,876,904, all produced in that country. These exhibits of production and mintage indicate a steady development of the mining interests of the United States of America, and also of Mexico, and with the increasing facilities of railway communication fostering every department of industry, the outlook for a continued growth in the product of precious metals is flattering.

Gutenberg's Roller Ore-Crusher.

We give on this page an illustration of Gutenberg's roller ore-crusher and grinder, several of which are now in operation in this State. Upon a suitable base is a pan having near its edge a deep annular groove, the inner wall of which is vertical and the outer wall inclined from below outward.

A central vertical shaft has its lower bearing at the center of the circles described by the concentric walls of the groove, and its upper bearing at the intersection of crosshairs or frames. Upon this shaft is placed a loose hub having radially projecting arms, upon the ends of which are spindles on which the crushing or grinding rollers turn. These rollers are of the same diameter, and their perimeters are

tally arranged driving pulley, acting upon the crushing rollers by frictional contact to cause them to turn on their spindles and revolve around the shaft. This driving pulley is keyed on the shaft by a spline or feather, and readily rises when the rollers pass over a lump of ore which they are incapable of crushing. It is provided on its upper side with an annular vertical flange, concentric with the master wheel and separated therefrom by an annular collar which holds the endless belt actuating said wheel off therefrom.

It will be observed that as the driving or master wheel rests solely upon the crushing and grinding wheels, the effect of the latter upon ore is greatly increased, and the efficiency of the machine correspondingly increased. Should the crushing power in working certain very hard ores prove inefficient, owing to a deficiency of the weight of the machine, this defect may be remedied by loading down the master wheel within the pulley flange, when there will be no interference from the belt.

In these machines the crushing wheels end driving wheel may be of various weights according to circumstances. By means of the weight receptacle the pressure on the rollers can be varied. The inventor, Wm. Gutenberg, is proprietor of the Sacramento foundry and machine shop, and his address will be found in our advertising column.

FIRST FINDING GOLD.—The story is going the rounds that Mrs. John Murphy, of San Jose, has been telling a reporter that gold was first found in California at Donner lake in 1846-47. Mrs. Murphy was one of a party snowed in at Donner lake that winter, and she says that John Denton, a gunsmith who was there, saw something shining in some rocks which had been used to build a fire upon, and Denton broke off the shining stuff and said it was gold, and he put it in a purse and put it in his pocket. Denton died and the gold was buried with him. This is a brief relation of a very long story. We think Mr. Denton did not find gold in any of the rocks at Donner lake, but that he saw some micaeone substance and pocketed it. The rocks around Donner lake, which were used for fire supports by the Donner party, are as bare of gold as the pocket this minute of the scribbler who scribbles this and who wonders while he scribbles why people will allow their imagination to run away with them on the gold-finding question. Marshall, at Coloma, El Dorado county, first found gold in California. The monument the Native Sons of the Golden West are going to erect to his memory will say so, and monuments always tell the truth.—*Foothill Tidings*.

RECAPITULATION.

2,407,550 lbs. Copper, at 6 cents per lb.....	\$ 144,453.00
208,800 lbs. Refined Lead, at 4 1/2-100 cents per lb.....	9,067.44
48,466,200 lbs. Unrefined Lead at \$38 per ton.....	1,405,231.54
5,919,842 ozs. Fine Silver at \$20.00 per oz.....	5,800,837.34
10,577 ozs. Fine Gold at \$20 per oz.....	211,540.00

Total Export Value.....\$7,631,729.32

Computing the Gold and Silver at its mint valuation and other metals at their value at the seaboard, it would increase the value of the product to \$10,365,044.67.

Comparative Statement, showing the quantity of the Silver and Gold contained in base bullion produced in Utah:

YEAR.	Total Ounces of Silver Produced.	Total Ounces of Gold Produced.	Ounces of Silver in Ores and Base Bullion.	Ounces of Gold in Ores and Base Bullion.	Pcr Cent of Total Silver Product.	Pcr Cent of Total Gold Product.
1877	4,359,703	17,325	2,102,098	11,035	48.2-10	63.6-10
1878	4,357,328	15,040	2,108,339	10,165	48.3-10	67.5-10
1879	3,835,047	15,932	1,797,589	5,693	46.8-10	35.7-10
1880	3,783,506	8,020	1,403,819	2,878	37.1-10	35.8-10
1881	5,400,111	7,958	2,643,896	2,622	48.9-10	32.9-10
1882	5,435,444	9,039	2,581,789	5,016	47.3-10	55.5-10
1883	4,581,768	6,991	2,351,190	5,597	51.8-10	80.
1884	5,660,488	5,530	3,253,084	3,806	57.4-10	68.8-10
1885	5,072,689	8,003	8,180,576	7,289	53.4-10	81.3-10
1886	5,918,842	10,577	2,888,263	8,369	47.0-10	79.1-10

Comparative Statement of the value of lead bullion, including silver and gold necessarily produced in its manufacture west of the Missouri River, compiled from the annual reports issued by John J. Valentine, Vice-President and General Manager, Wells, Fargo & Co., San Francisco.

YEAR.	Total Value of Precious Metals, including Lead.	Total Value of Lead Bullion, including Gold and Silver Contents.	Pcr Cent of Entire Product.
1878	\$81,154,623	\$14,740,581	18.1-10
1879	75,340,501	10,234,394	13.5-10
1880	80,167,936	28,114,564	35.
1881	84,504,417	30,255,430	35.8-10
1882	92,411,835	35,798,750	38.7-10
1883	90,313,612	34,810,022	38.5-10
1884	81,476,954	31,191,250	38.7-10
1885	90,151,200	35,731,711	39.6-10

The above statement shows a marked annual increase in the percentage of precious metals produced in the manufacture of base bullion. It demonstrates conclusively that the process of smelting is in the ascendant for the reduction of ores, and that any causes tending to decrease or discourage the production of lead will produce a corresponding decrease in the gold and silver production west of the Missouri River.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WILDMAN.—*Ledger*, Jan. 22: The resumption of work on this mine is expected, and not without good reasons, to restore the town of Sutter Creek to its old-time prosperity. It has been idle for about 20 years. A shaft was sunk 500 feet and two drifts run north and south about 50 feet, disclosing a ledge of fair dimensions, which paid all the way from \$3 to \$18 per ton in free gold. The rock was worked in a 10-stamp mill, and the fact that it was closed down as unprofitable is no argument that it would not be a first-class paying property with the improved gold-saving apparatus of the present time. If the ore averages \$6 per ton, and it certainly ought to do better than that including sulphurets, it can be made to pay. John Tregloan, Sen., who is a first-class miner, and who in fact was the original locator of the South Spring Hill—one of the best mines in the State—about six months in the East, succeeded in disposing of the mine to heavy capitalists in Boston, who are starting in to work it on a scale that promises success. A large portion of the lumber for the hoisting works is already on the ground. Knight & Co. are making a hydraulic pump—one of Knight's invention—for this mine. There is one of these pumps in operation at the Plumas Eureka mine in Plumas county—one of the biggest mines in the State—and it has been found economical and satisfactory in every respect. The pump for the Wildman is to be 10 inches in diameter, and is calculated to discharge 200 gallons per minute, equal to a steady stream of 17 miners' inches. It will take about two months to get it in working order. We understand that it was the heavy flow of water, and the difficulty encountered in controlling it, that was the principal cause of the mine being abandoned in former days. There is no doubt that the water can easily be controlled now, and we expect that in the course of a year the Wildman will take its place among the permanent and paying mines of Amador county.

MISCELLANEOUS.—At the big tunnel at Middle Bar, another body of rich metal was encountered a few days ago, in extending the tunnel northward. The extent of the strike we have been unable to ascertain. Geo. Durban has been placed in charge of the works during Mr. Nevill's absence. Some fine specimens of black metal, containing a large percentage of gold, were taken from the Valparaiso ground last week. This mine joins the Mammoth at Middle Bar on the north.

Calaveras.

GLENCOE.—*Calaveras Chronicle*, Jan. 22: Mining, the foundation of our sustenance, has a healthy appearance, with every prospect of improving as the season opens. The Banner mine, under the management of J. T. Davis, has been placed in good working order, there being an eight-inch Cornish lift pump at present in operation, taking out the water. As soon as the water is out, the parties intend putting on a force of 30 men taking out rock. A mill for grinding will be placed in the gulch adjoining the mine. Jones & Co. have erected substantial hoisting machinery on the Conrad mine, and intend to commence about the 25th inst. to take out rock, having at present a vein over four feet in width in the shaft that will mill \$25 per ton. T. J. Posey has a full force of men to work preparing for a 10-stamp mill which is en route from San Francisco for his mine. Thos. Woodcock has had a force of men for the past month extracting ore from the Stonewall Jackson, which shows up finely for the amount of development. A splendid arastra mill has been erected on Wet Gulch by Maston & Son, which is kept busy and is even unable to do the work of its patrons. It has been a long-felt want and is appreciated by the mining fraternity. Reed & Co., of Mokelumne Hill, have had some rock tested from the McNoble Brothers' mines which prospect upward of \$40 per ton, mill process in San Francisco.

GOOD RUN.—*Calaveras Prospect*, Jan. 22: The first 26 days' run of the new mill just completed in this vicinity by the Union Gold Co. resulted in a cleanup of \$9132.79 with 30 stamps. A sample of the rock taken from the two-foot vein tapped at the 200-foot level, assayed in San Francisco the first of the week, showed \$602 per ton result.

El Dorado.

A NEW MILL.—*El Dorado Republican*, Jan. 20: E. Ball was in town last Saturday, from the El Dorado mine, adjoining the Church-Union, on which he will superintend the construction of a ten-stamp mill that is to be immediately put up. The owners—ex-Governor Perkins, W. H. Brown and Jacob Neff, of Placer county—are men of means, and they will have the capital to develop the mine if the prospects continue to be encouraging. The adjoining Church-Union has now a very large body of paying ore in the 1400-foot level, so that the theory that mines on the great mineral belt will be as good in this county as in Amador, when a sufficient depth is reached, may be perfectly correct.

AN OLD CLAIM.—*Georgetown Gazette*, Jan. 22: H. A. Wagner is still working his mine between Dry Creek and Bear creek. He has been working the claim since 1872, and has now made application for a patent. If all our miners who are holding mining ground, and desire to have the mineral land held for the use of the miners, would persist in working their claims, as does Mr. Wagner and others we could mention, there would be more paying mines discovered and more mineral patents applied for, which would do much toward deciding the controversy between the miners and R. R. Company.

Fresno.

QUARTZ.—*Foothill Tidings*, Jan. 22: Mr. James Bennallack, well and favorably known as a mining expert, during his recent absence from town, visited some quartz mines in Fresno county, acting in the interests of London capitalists. The gentleman has brought to town some specimens of ore taken from one of the mines visited, and exhibited the same to the reporter. The ore presents a lively appearance, shows gold freely, and would be taken as coming from one of our local mines. Mr. Bennallack asserted that the general characteristics of the quartz

vein from which the samples were taken more closely resembled that of the Grass Valley district than any he has ever seen.

KING'S RIVER.—*Cor. Fresno Examiner*, Jan. 22: I had occasion to visit a part of the mines on the north side of King's river—that is to say, Big and Sycamore creeks. On Sycamore creek there are several persons actively engaged in placer mining along the creek. Among the most noted claims is one owned by Ed. Rape and George Shannon. They are diligently "ground-sluicing," and are making considerable money. They are also the owners of the Black Cut quartz mine, which is five feet wide and prospects well in flour gold and sulphurets, and lies in talc formation. The Trove lode, owned by Rape & Slocum Brothers, prospects well in fine gold. A shaft sunk 25 feet shows a well-defined ledge four feet wide. On Big creek I visited the Jack Watts mine, now owned by Dr. Barnes. He has a one-stamp mill running on very rich quartz. Recently a strike was made in this mine of fabulous richness, and its extent is unknown. It is thought by those who pretend to know that the "pocket" is worth at least \$50,000. There are several other good mines in this locality, and before another year has elapsed it will be one of the best districts in the State on account of its great facilities for water-power. The best of timber is abundant, and nothing is wanting except a small amount of capital.

Nevada.

LATE DOINGS IN MINING CIRCLES.—*Foothill Tidings*, Jan. 22: The Grass Valley air is thick with mining talk. Rumors of mines sold, to be sold, bonded, leased, being examined by capitalists, and so on, are prevalent everywhere. It is a fact, however, that there is great activity in Grass Valley mining circles. Many capitalists or their agents are in and around town, and much quiet business is transpiring. In the near future we hope to announce facts, in the way of mining enterprises, that will convince our people that all the rumors afloat are not without foundation, and that the palmy days of this district are yet to come. The Gold Leaf mine, situated near the North Star and adjoining the latter on the south, has been bonded by San Francisco parties in the sum of \$10,000. The parties bonding the Gold Leaf have agreed to place machinery on the mine and to do a certain stated amount of work, and the work will commence immediately. This claim is owned by B. Johnson, S. H. Dille, Jos. Griffiths, Charles Whiting and Robert Kemp. Although situated in a favorite mining locality, but little work has been done on the claim, only prospect shafts having been sunk, the deepest of which is but 40 feet. From these shafts rock ranging from \$30 to \$100 per load has been taken. A crushing, recently completed, of 24 loads of rock from the Slate ledge, or Perrin mine, yielded \$34 per load. Francis & Co. are the lessees of this mine. The new 30-stamp mill being erected for the North Star Mining Co. is nearing completion. If nothing unforeseen happens the mill will be pounding out gold by the middle of February, or, at the latest, the first of March. About 100 tons of ore is now on the dump and large quantities being taken out daily. When completed, the North Star Co. can boast of the finest quartz mill in the State, if not in the world. The Metropolitan mine, situated near Moore's flat, has a ledge which is from four to six feet thick and pays \$5 per ton, and the ore can be extracted and crushed for \$2 a ton. The ledge is worked through tunnels, and is strongly developed, having been prospected for a distance of 2900 feet. The Metropolitan has been worked so as to give from 2000 to 3000 feet of backs. The mine could not be better located as regards water-power for running a mill, but the owners have not the capital to erect one. John G. Jones, a well-known prospector, was in town last night, and he told several of our citizens that he has sold his Diamond quartz ledge, adjoining Leaman's vineyard, to New York men for the sum of \$50,000. It is said that the French Co. who are negotiating for the Pennsylvania mine, and who have a deed in escrow for the same, hold a similar deed for the Boston mine, situated on Wolf Creek. The Boston is regarded as a good prospect. The lessees of the Horseshoe mine are sending out some good rock.

THE IXL MINE OF WASHINGTON.—*Nevada Transcript*, Jan. 21: Work is progressing favorably at Geo. J. Binder's IXL mine on Poorman's creek, 24 miles northeast of this city, and 6 miles from the town of Washington. A mill will be erected in the spring, and in the meantime the preparations for the systematic working of the ledge are going on. This claim has quite a history. It was worked 15 years ago with an arastra. After a good cleanup one of the partners took the bullion and went to town to convert it into coin and pay what bills were owing. Instead of attending to business, he had "a run with the boys," and squandered the money. After the next cleanup, the other partner said he would show partner No. 1 how to do up business in shape, but he, too, fell into the hands of the Philistines. Trouble with creditors resulted in the mine being shut down. A tunnel had been run in 75 feet showing a ledge 15 feet thick and giving 852 feet of backs. Recently 10 tons of ore were worked at the California mill. The result was five per cent of sulphurets worth \$2.50 per ton, and \$4 a ton in free gold. It is estimated the ore will mill \$14 a ton, including sulphurets, and that there are 600,000 tons of such ore in the claim. Mr. Binder, who came out last May from Rochester, New York, is obtaining a patent to the ground. He has ample capital to properly develop its riches.

ALLISON RANCH MINE.—*Grass Valley Union*, Jan. 20: Advice just received from London leave but little doubt that the Allison Ranch mine of this district will soon pass into the hands of a company that is being organized in that city. The purchase-money for the property has been guaranteed, and it is believed that sufficient of the stock will soon be placed to raise an ample working fund. The parties in interest are not the same who were negotiating in France last season to organize a company to take the same property. The Allison Ranch mine is highly regarded by mining men who are familiar with its history. During the days of its successful operation, it produced in gold bullion over \$3,200,000, and was not worked below 500 feet on the incline of the vein, and work was stopped because of reduced product and the inability of the machinery for deep working. At that time miners were of the opinion that the riches of the quartz veins of the district were confined principally to superficial depths, 300 or 400 feet, and that deep working would not

pay. Later experience has proven the fallacy of this theory, as shown in the case of the Idaho, which is worked 2200 feet on the incline, and the Empire and North Star, respectively 1500 and 1600 feet, all of which have found rich and profitable quartz at that depth. There is every reason to believe that the Allison Ranch mine yet contains a great store of wealth, as there is a large extent of ground that has not yet been opened, and the last working of the mine left good pay ore in sight.

RICH QUARTZ BOULDER.—*Nevada Transcript*, Jan. 20: It has always been the opinion of well-informed miners that there are many valuable quartz ledges in and around North Bloomfield. While but little prospecting has been done for quartz, yet a number of ledges have been seen in the gravel mines of that section, and in fact no notice has been taken of them, it being considered that the gravel would pay better than the quartz. Every once and awhile a valuable piece of quartz rock has been found in the gravel claims, all going to show that there must be rich ledges there. Only a few days ago a beautiful quartz specimen was found in the Derbec drift gravel mine. It was almost round, measured about four inches in diameter, and was literally covered with gold. The weight of it was six pounds and one ounce, and according to the assayer's returns it contains 33.03 ounces of gold, 90 fine, making it worth, in 20-dollar pieces, \$707.53. A great many smaller specimens have been found there, but this is the largest one. The mine generally is looking splendidly, and bids fair to continue paying dividends for years to come. It would not be surprising to hear at any time of an immense strike of richer gravel than any yet encountered, as they are now working in a place where rich deposits are usually found.

NORTH STAR.—The rainy weather is interfering with the laying of the North Star water-pipe line, and appearances are now that the mill will be finished before the water is ready to be turned on.

Placer.

A MINING PURCHASE.—*Placer Herald*, Jan. 22: We learn from Mr. Benj. Hawkins, of Ophir, who was in Auburn last Wednesday, that Charlie Reed and a company of Grass Valleyans have purchased the St. Patrick quartz mill and the old Spanish lead, near the mill, and will run these properties in connection with the St. Lawrence mine, heretofore owned by Reed. They are opening up the old Spanish lead, working eight-hour shifts, and are developing some pretty good ore. The St. Patrick mill is one of the best in this part of the country, and the two mines will probably furnish ore enough to keep its 10 stamps pretty busy.

FOREST HILL.—*Herald*, Jan. 22: The Mountain Tunnel closed last week, as the men refused to work until they received their back pay. Some of the stockholders came up from San Francisco last Sunday afternoon to examine the work. It is thought that their demands will be granted and work will soon be resumed.

EXCELSIOR.—*Placer Argus*, Jan. 22: Work has been suspended in the Excelsior shaft owing to the amount of water in the mine, and the machinery has been removed. It is probable that a tunnel will have to be run to drain the mine before operations can be resumed. As the mine has been promising extremely well and the owner, Mr. Chas. Harley, is wealthy and moreover has every reason to be well satisfied with his prospects, there can hardly be any doubt of the work being undertaken ere long. The Live Oak is doing finely, the mill being kept running as constantly as the limited supply of water will permit. About 20 men are employed there. The May Flower tunnel is progressing satisfactorily. The shaft will be completed this week, after which, work on the tunnel will be done from three faces. It will take six or seven months more to complete the work.

Plumas.

TUNNEL.—*Greenville Bulletin*, Jan. 20: The Plumas Con. Mill & Mining Co. will soon begin running a tunnel to tap what is known as the Magna Charta chimney. The large "air compressor" now in position will enable the company to make rapid progress. This is one of the finest pieces of machinery of the kind ever brought to Plumas.

San Bernardino.

PROVIDENCE MINES.—*Calico Print*, Jan. 23: Some time ago D. Bahten & Co., of your town, agreed with Kerr & Patton to put a five-stamp mill on their mine at this place. The Perseverance group almost joins the Bonanza King mines on the north. The mill has been erected under the supervision of Godfrey Bahten, and is now in complete running order. A run of four days was made, and from the first stroke of the engine it was clear that everything was in place. The mine is full of ore in the various stopes, and only awaits hoisting works to get it out cheaply. The ore bodies are large and the ground easily worked, so that it only requires a few men to keep the mill running. It is rumored that the Bahtens have already sold the property to an English company for a good figure and that the new company intends adding largely to the reduction works. The ore shipped to Kingman from the new find on the west side of Providence mountain, called the Grey Hound group, made a good showing, yielding nearly 100 ounces to the ton. The owners have struck a body of water at the depth of 40 feet. The Bonanza Company so far does not appear to be making any move in the direction of putting up new works, although their property never had more ore in sight. The owners are all rich men and they are likely waiting until silver becomes a fixed standard.

MESCAL MINING DISTRICT.—The Cambria Mining and Milling Co. has already shipped 13 bars of bullion, making about 15,000 ounces from the work of their five-stamp mill. The ore is a hard quartz, and Mr. Carr, the superintendent, has just made arrangements with the Baker works of Los Angeles to put in five stamps more, which will double the bullion output. They made a large, rich strike lately in the lower levels and only require a few men to keep their mill running to their full capacity. It is rumored that the old Ivanpah works have been sold to Messrs Carr & Hodgins, and that they will shortly start up the works. Ivanpah has always paid its way, never having had any capital invested.

NEW YORK DISTRICT comes once more to the front. It is understood that parties with means have offered to put in some reduction works for an interest in the mines, and that at an early day we

will hear from New York in the way of bullion, there being a large quantity of ore on the dumps. Messrs. McBride & Miller deserve success after so many years of hard labor.

THE GOLD MINES of Arrow Mining district are again attracting some attention. Some few men are at work, the last assays from the Golden Queen at the depth of 40 feet going up into the hundreds. The La Præta is down 60 feet, showing a fine vein. This is a property that capital could soon have returns from.

Shasta.

BONANZA.—*Courier*, Jan. 14: The Old Diggings mining district is Bonanza. In early times of gold mining the surface diggings there paid immensely, from grassroots to bedrock. Years after the placers were worked out, quartz ledges were discovered containing gold, but they were only worked on the decomposed surface. Tom Harrison and a few more standbys got the "quartz fever" during the Copper City excitement, and while some fell away, Tom stuck to the true business, and to-day has a fortune in his grasp in the shape of the "Old Spanish claim" at Old Diggings. The ledge shows four feet in width, and the rock is so rich in both free and sulphureted gold that it hangs together as though woven and interlaced with copper wire. This ore is too rich to be trusted to treatment in any mill in this county, and will be sent to San Francisco for manipulation before being run into \$20 pieces at the mint. The Big Central, owned by Hopping, Bell, Garrecht, Young, Panther and Hearst, is an immense ledge carrying free and sulphureted gold in quantities that send the ore booming up into thousands of dollars per ton. The mine is named the Big Central for the reason that it is the center of a group of mines all of which are rich and "bonanza." There are other great ledges in the Old Diggings, in fact a network of them, the gold yield of which shows that the district is entitled to the cognomen of Bonanza district.

Santa Clara.

OIL DEVELOPMENT.—*New Alma Cor. San Jose Herald*, Jan. 22: Mr. R. C. McPherson shows that he means business in going ahead boring new wells for oil in the vicinity of the old ones on Mr. Moody's land; one well is already down 400 or 500 feet, and another one about ready to begin boring. Mr. McPherson is confident that there is plenty of oil in the mountains, but of course it is expensive feeling around, as every step costs thousands of dollars. Some years ago the former oil company sunk a big sum of money hunting for oil east of the Moody gulch, toward the tunnel of the S. P. R. R., on account of the big amount of gas which gathered in the tunnel while excavating it, and it will be remembered, killed 40 Chinamen in exploding; but they did not find a drop of oil for all their outlay. Mr. McPherson, should he be successful, is therefore likely to follow Horace Greeley's advice and go West, and is doing so. If he still adheres to his old imaginary line taken from the tunnel to the old wells, he will cross the Logan, Hebart, Rankin, Koppitz and Kenowden properties. On the Koppitz land is located the old Gould well, bored some 20 years ago to a depth of 300 feet, and then abandoned for lack of funds. That well is "gassing" yet, it is said.

NEVADA.

Washoe District.

SAVAGE.—*Virginia Enterprise*, Jan. 22: Hoisting ore from the 500 and 600 levels, and have about 350 tons on the surface. On the 800 level the swelling character of the ground has necessitated the re-tiling of the several drifts and easing many of the timbers. The machinery at the old shaft is in successful operation and works well, the cages running through the shaft to the 600 level, where a working station has been finished. On the 1640 level the north and south drifts continue in the favorable quartz body, mention of which has been made in previous reports.

OCCIDENTAL.—Upper tunnel—The south drift from the north incline winze has been extended 10 feet; total length, 80 feet. East crosscut from the same has been extended 11 feet; total length, 26 feet. Have retimbered a portion of the north incline winze from the 100 station to the lower tunnel. Extracted 10 tons of low-grade ore.

GOLDSTONE.—This mine is situated on the main range of mountains running north from Virginia, and is now being worked by a good substantial tunnel, which will cut the vein 150 feet below the surface. Now are in a blue clay wall, about five feet from which four or five inches of running water is coming. The tunnel is in about 150 feet. This mine is owned in London and San Francisco, and the company will drive the tunnel west completely across the Comstock mineral belt.

BEST AND BELCHER.—600 level—West crosscut No. 2 has been extended 38 feet; total length, 70 feet. The face of the drift is in a porphyry formation, showing quartz. 800 level—No. 4 west crosscut extended 30 feet; total length, 132 feet; porphyry formation.

GOULD AND CURRY.—425 level—East drift has been extended 24 feet; total length, 105 feet; porphyry and quartz mineralized, giving low assays. A vertical two-compartment upraise has been started in the south drift at a point 425 feet from the main west drift and advanced a distance of 28 feet. The top of the raise is in quartz and porphyry, showing some value.

HALE AND NORCROSS.—Work progresses favorably in the north drift on the 1200 level. The face of the last crosscut from this drift is in ore that gives good assays. The last few feet run in the south drift in this level is also in ore, which gives some good assays. The east crosscut 60 feet north from the face of this drift discloses some good ore.

UTAH.—472 level—The south drift from main west drift has been extended 40 feet; total length 192 feet. This drift has connected with the Sierra Nevada north lateral drift No. 2. At a point in the main west drift 400 feet from the shaft are preparing to start a north lateral drift.

CROWN POINT AND BELCHER.—The work of extracting ore continues about the same as a week ago. It comes from the 1500, 1600 and 1400 levels; also from the 200, 300 and 400 levels. The water in the 1700 station has not risen during the week.

POTOSI.—The crosscut on the 250 level south of the Linsley drift has passed through the ore a dip,

lance of 70 feet, and is now in clay. The south winze is down 70 feet, and the ore encountered is not quite as good as it has been.

SIERRA NEVADA.—\$20 level.—West crosscut No. 6 has been started from north lateral drift No. 2 at a point 60 feet north of west crosscut No. 2 and advanced 51 feet; porphyry formation.

BULLION.—Good progress is being made in the west drift on the 300 level. The formation is quartz of a lively character. The drift started last week from the east station has been advanced 20 feet.

KENTUCK.—The number of tons of ore hoisted to the surface during the past 10 days has decreased, owing to the quantity of water used in running the hurdy-gurdy wheel diminishing.

ALPHA AND EXCHEQUER.—The drift on the 122 level is being pushed ahead in the body of quartz encountered last week.

SCORMION.—Have commenced drifting east from the 300 level station. Everything working smoothly.

NORTH GOULD AND CURRY.—Repairing and re-opening the shaft continues, good progress being made.

CHOLLAR.—The shaft is cleaned out to a depth of 70 feet.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, Jan. 22: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Dandergberg mine, 91 tons; Prospect Mountain tunnel, 4½ tons; Silver Lick, 9 tons; Jackson, 48 tons; Bullwhacker, 2½ tons; Silver Connor, 5 tons; Eureka tunnel, 4 tons. Eureka Con. Co., Gilmore mine, 3½ tons; Dimick, 8 tons; Geddes & Bertrand, 18½ tons; A. R. Watson, 1½ tons; Eureka tunnel, 2 tons.

Garfield District.

A DIVIDEND.—Dayton *News-Reporter*, Jan. 21: The trustees of the Hinley mine, located in Garfield district, have declared another dividend of \$1.50 per share. This makes a total of \$18,750 which the stockholders have received during the last six months. It is giving better returns for the capital invested than any other mine in Nevada.

Hawthorne District.

THE LAPANTA.—Cor. Walker Lake *Bulletin*, Jan. 21: On 1st shaft level in crosscut, north, a winze has been sunk nine feet in the large ore body cut by this drift—bottom of winze is in same kind of ore. In main drift parallel to 1st shaft level, the winze is down 16 feet, carrying a heavy body of brown ore. The crosscut at west end of 1st shaft level running north has been extended 23 feet, total length 50 feet. The ground is still somewhat broken, but carries the ledge with it and looks extremely favorable. The stopes above the 1st shaft level on the west end are looking extremely well, and the ore is very rich (\$175 per ton in gold). In the west drift from foot of "No. 6" incline, the winze has been sunk 12 feet, encountering the footwall which at that point dips to the northeast and extends northwest and southeast; the heavy body of ore cut by this winze extends down to the footwall. The upper tunnel at the top of the main incline has been extended into the hill (north) 25 feet, showing a fine ledge of good ore (\$40 in gold) all the way along, and the same is very strong in the face—total length of tunnel 60 feet. The ground being prospected by this tunnel is all virgin ground, and the indications are extremely favorable for finding a large body of very rich ore. The usual amount of ore is being extracted, everything working smoothly in and about the mine.

Jefferson District.

GOOD ORE.—Belmont *Courier*, Jan. 22: The Jefferson chloriders are taking out good ore.

Madry District.

RICH ORE.—Belmont *Courier*, Jan. 22: Rich ore is being shipped from Morey.

Mount Ross District.

CONCENTRATED ORE.—Silver *State*, Jan. 22: E. Reinhart & Co. shipped yesterday to Argo, Colorado, 31,770 pounds of concentrated ore, valued at \$450 per ton, from the Paradise Valley mine.

Northumberland District.

CHLORIDERS.—Belmont *Courier*, Jan. 22: The chloriders of Northumberland district are taking out good ore.

Ressie River District.

MANHATTAN.—Reese River *Reveille*, Jan. 22: L. J. Hanchett, of Austin, is the general manager of the Manhattan property for the new company. It is the intention of the new management to begin work soon in adding improvements and increase the capacity in the reduction of ore. Four Huntington mills will be set up in the old Boston mill, after it has been thoroughly overhauled, and 12 concentrators, some of them Frue's and one or two of the Richmond patent will be tried. The company will discontinue the lease system, and put on day's pay men to develop the mines. The old furnace at the mill will be replaced by a Howard & White furnace, with dryers attached. The mill will be repaired from top to bottom. The new company intend to get things started as soon as possible.

Taylor District.

ARGUS MILL.—White Pine *News*, Jan. 22: The Argus mill was shut down Thursday for repairs, which will take seven or eight days to complete.

Tuscarora District.

NEVADA QUEEN.—During the week, No. 1 crosscut west, 200-foot level, has been extended 38 feet; total distance from north gangway, 198 feet. Shaft has been sunk 12 feet. North gangway, 350-foot level, has been advanced 11 feet. Rock continues hard.

NORTH BELLE ISLE.—North gangway, 400-foot level, has been driven 27 feet. Rock is hard, but breaks well.

NAVAJO.—No. 2 winze from east lateral, 350-foot level, has been sunk 7 feet. North drift on new vein, 150-foot level, has been advanced 11½ feet.

TORNADO CON.—Spent a good deal of time during the week in extending drain to face and in laying 300 feet of track. Also started a crosscut 150 feet in tunnel, westerly from footwall of ledge, to crosscut the entire lode, which is about 50 feet wide at this point.

BELLE ISLE.—*Times-Review*, Jan. 21: Belle

Isle and Navajo joint crosscut west, 150-foot level, has been extended 20 feet. East crosscut, same level, has been extended 4½ feet.

Union District.

SOLD.—Esmeralda *News*, Jan. 22: The series of mines formerly owned by Geo. W. Veach and located in Union mining district, in the vicinity of Lone and Grantsville, have been sold, and Mr. Peck, the manager for the company, is now in charge of the property and is repairing the mill at Knickerbocker canyon, which the company will have running in 60 days. The mines of this district have, in times past, yielded considerable bullion, the ore being chiefly gold and silver bearing. That country is in a fair way to have a boom and one which will be lasting. The mines are rich and the ledges well defined, and have facilities for cheap and economical reduction of the ore, there being an abundance of the finest pine timber and water. To George W. Veach is due the praise of resurrecting that camp from its Rtp Van Winkle slumber. Cincinnati capitalists now own this property, who will work it for what it contains and not as a stock gamble.

WORK PROGRESSING.—Belmont *Courier*, Jan. 22: Very little news comes from Western Nye, but we understand that work is progressing satisfactorily in the mill at Grantsville, and also in the Knickerbocker mill, which is being put in thorough repair under the direction of Thomas Mitchell. When complete, it will be started up on ore from the mines of the new Cincinnati company, and a long and prosperous run is confidently expected. Union Mining district has lively times in store for it this summer. Other mines in this district will probably be started up soon.

Ward District.

OF INTEREST TO MINERS.—White Pine *News*, Jan. 22: In another column will be found the notice of Mr. Culver, superintendent of the Martin White mines at Ward. He informs us he is prepared to let several very promising contracts to tributers in the company's mines on liberal terms. No doubt miners who have vim and ambition could do much better on such layouts than by working for day's pay.

ARIZONA.

SAMPLING WORKS.—Prescott *Courier*, Jan. 21: The sampling works will be erected near the railroad depot. J. B. Pace, of Hassayampa district, has brought in rich rock from the U. P. mine. Deputy Sheriff Hickey, while in Turkey creek district, the other day, was shown several tons of high-grade silver ore which had been taken out of the Roach mine. J. N. Redenberg and others are going to ship ore from mines in Walker district.

SMELTER.—Tombstone *Democrat*, Jan. 22: The smelter at Charleston continues in successful operation. Work on the hill in the different mines continues on a small but steady basis. The Toughnut mine resumed work Monday morning, thus proving that an era of better times is near at hand—in fact is already dawning. Mr. C. W. Leach informs the *Democrat* that he finds it impossible to obtain a sufficient number of miners in camp to meet his requirements in the operation of his mines. Cooper & McCracken are working their new find, and are taking out some very valuable ore. If indications are worth anything, this is one of the richest mines in the camp and its owners have a good thing.

TONTO BASIN.—Cor. Prescott *Courier*, Jan. 21: Charles Bacon, the veteran prospector of Tonto Basin, is still sinking on his Golden Rule mine. At a depth of 60 feet he has a three-foot vein of rich, free-milling gold quartz. He says Tonto Basin is bound to be one of the best mining districts in Arizona. Marion Brady is also in luck in his mine at the foot of the Matzats. He has a 3½-foot vein at a depth of 70 feet, which assays over \$100 per ton in silver, besides considerable gold, and is also free-milling. Mr. Brady has been repairing the O'Dougherty mill, on account of the bursting of two of the flues. It will be some time before the mill can be started up.

COLORADO.

IDAHO SPRINGS.—Gazette, Jan. 22: The Freeland is shipping its usual quantities of ore. The Plutus is now shipping more ore than usual. The late falling off was caused by the prosecution of development work. The Mattie mine is shipping a large quantity of ore. The mine is reported to be looking splendidly. The Crystal employs the usual force and ships regularly. The Argo is shipping unusual quantities of ore, which runs well. Several more jacks have been added to the train, and they are working day and night. Some few leasers are at work on the Donaldson. It's a pity to see such an excellent property lying almost dormant. The Champion, on Bellevue mountain, lies idle. This should not be, as it is one of the very best mines in the district. The Grand View, Seaton mountain, is being worked by a party of leasers. Hardy & Wright, working the Santa Fe, are bringing down to the Allen sampler the usual quantities of ore, some of which runs away up. The Santa Fe is one of the biggest mines in that district. It is reported that a prominent Seaton mountain mine is about to change ownership. Ben Allen has his hands full at the sampling works. Ore rolls in great quantities.

IDAHO.

FLINT DISTRICT.—Wood River *News-Miner*, Jan. 2: John Duff, formerly superintendent of the Big Lode mine, now superintendent of the Perseverance mine, in Flint district, Owyhee county, brought a shipment of ore from that mine on Monday to the smelter at Ketchum for reduction. The ore is high-grade concentrates. The mines in Flint were abandoned a few years ago, but good, practical men have taken hold of them and are now making them pay well, and the place is having a boom. They ship the ore to the Ketchum smelter because they get better rates than at any other place.

ROCKY BAR.—Wood River *News-Miner*, Jan. 14: The Alturas Limited Company (the old Ida Elmore) has a very fine new 50-stamp mill, which crushes 70 tons per day, and a 10-stamp mill that works 12 tons per day. Next year the company will add another 50-stamp mill and increase the 10-stamp mill to 30 stamps, making 130 stamps, capable of working nearly 200 tons per day. The ore from this mine works on an average \$22 per ton, which

will make, when the new machinery is added, a production of about \$4000 per day. The lode is from 5 to 20 feet wide, and no waste. This is probably one of the most valuable mining properties in the county.

MONTANA.

JEFFERSON COUNTY.—Cor. Butte *Miner*, Jan. 22: Your correspondent proposes bringing to the front those who have invested (some of them heavily) in an almost unknown region, which is now productive. I refer to that portion of the Territory lying between Butte City and Boulder. I start with the Major Budd, owned by Major D. D. Budd, Dan Welch and W. A. Clark. There are now two tunnels penetrating the mountain from the start. The western extension is owned by Major Budd and John Kelsey. The first tunnel starts from the central portion of the western extension and runs in 700 feet, crossing several good veins of base ore, inclusive of one good-paying streak 17 feet wide. The second tunnel is now in 1300 feet, and a force of 12 men are engaged in driving the material work to a 1500 breast. The work is being done on the drift of the vein, and is panning out ore which goes from \$135 to 600 ounces in silver, with heavy traces of gold. Steeping and drifting is the principal work being done, and the result from battery assays gives to the producers anywhere from \$60 to \$100 per ton in silver, and a heavy trace in gold. The eastern extension of this mine (the Major Budd) is owned by Henry Nikel et al. The Budd, which is producing so heavily now, is within 200 feet of the eastern extension, and so far as battery assays go, the products show an increase in silver, gold and lead, with a heavy strain of zinc and a small amount of carbonates. The lode is a true fissure silver-bearing quartz vein. The engineer reports in the Major Budd \$56,958 in ore stopes (in sight) and says "the average yield is \$66 per ton, silver, and if the ore bodies in the other two stopes were developed, I do not doubt large resources of ore would be exposed." Col. H. H. Horst is the next fortunate owner in mining property. His capital represents many thousands of dollars already expended, and very many more in sight ready to be taken out and transmogrified into ready cash. His group of mines have attracted the attention of Eastern and Western as well as European capitalists, and in the early spring a large force of men will be put to work in exploitation and general development of veins which are already panning out good pay ore.

MINING ACTIVITY.—Anaconda *Review*, Jan. 20: A gentleman who is as well acquainted as any one with the mining activity in this district, said, the other day, in conversation with a *Review* reporter: "I have never seen mining activity so suddenly brought to a standstill as has been the case in the mining district just west of Anaconda. Four weeks ago the hills were covered with prospectors, and in every little gulch work was being done. Now nothing is going on. The Blue-eyed Nellie is still running, and the O'Brien brothers have a few men at work on their mine. Their shaft is now down to a depth of 101 feet, and they are engaged in building a whim. They have four or five men at work. Cornelius & Co. have a few men at work taking ore out of the Iron-Silver lode. What was a few weeks ago a flourishing little mining camp over on Lost Creek is to-day entirely deserted. There is not a man left there. There is no cause for this except the severity of the weather. The mining district is new and miners were not yet fixed so as to stand severe cold and four or five feet of snow. Every one expresses confidence that good-paying properties will be found just west of Anaconda, and that the camp will boom as soon as the snow goes off." This is the view held by all who are acquainted with the discoveries made last season.

GRANITE AND PHILIPSBURG.—A gentleman who came down from Philipsburg on Thursday favored the *Review* with some pointers in regard to that flourishing camp. The Granite Mountain is running full blast and employing 300 men. On the 20th they will start up the new mill, which will increase the capacity of the works to 60 stamps. Previous to this they have been running only 20 stamps. The ore bodies in this great bonanza are looking finer than ever before. The Bimetallic mine is working about 60 men, and is supposed to have struck the same lead that the Granite Mountain is working. It is rumored that the old Algonquin mill at Hasmark will soon change hands and become the property of the Bimetallic. The North Granite is reported to have struck it rich. This mine is owned in Helena, and was formerly called the Kitty Hynes. It is being worked by Phil Sanders with a force of 30 men. The Black Pine prospect is looking splendidly. The stock is now selling at 75 cents.

NEW MEXICO.

KINGSTON.—Black Range, Jan. 22: The Albatross, belonging to Allen and Kent, is looking well. Mineral creek holds her own, and North Percha is looming up. A new gold strike is reported one-quarter mile northeast of Kingston. Alex. Rogers and Col. Gillette are doing some splendid development work on the Black Colt. It is reported that a chamber 400 feet in length has been struck in the Louisville on the east side of Ladrone gulch. Chas. J. Goff, superintendent and manager of the Black Range Lixivation Works at Chloride, called at the Socorro Union office Monday, and stated that these works would be ready to start in full operation by March 1, 1887. The last two carloads of machinery are on the road for the plant, and a large part of it is already in place. Mr. Goff is entitled to much credit for the energy and persistence which has enabled him to push this enterprise so near to successful completion. Chloride already feels its good effects. There is not a vacant house in the town, and life and activity everywhere is seen where one year ago everything languished except work on the Silver Monument. This move will be an important factor in the extension of the Magdalena branch toward the Black range.

OREGON.

GOOD PROFITS.—Bedrock *Democrat*, Jan. 22: The Connor Creek mine, near Snake river, in this county, has within the past six years and a half yielded its owners \$644,000 net profits, and during the time they have paid out for work, improvements and machinery \$616,216. There is no boom in this

mine; it is not incorporated but belongs to private individuals, who have constantly worked it for the time mentioned. This is one of the many mines in Baker county that are paying its owners nice dividends, and nothing said about them. It is true without question that this is the mine of Baker county. We have the above facts from the very best authority.

NEW QUARTZ DISCOVERY.—From Mr. Joseph Dolby, who was in this city last Thursday, we learn the following: Some time ago some prospectors went from Pine Creek into the Big Creek country, and after prospecting for some time were fortunate enough to find a good lead. At first the lead was only 1½ inches wide, but at a depth of 40 feet, the ledge has attained a width of 12 inches. The ledge has been christened the Anna Moore and is owned by McCue, Miles & Wilson. The rock in this ledge is free milling and assays as follows: Silver, 233 oz., 25 per cent lead and \$1.50 gold. Another mine was also discovered by Miles & Neal, and the quartz is mostly gold bearing, as it assays \$64 gold and \$2.75 silver. The ledge when first discovered was only ten inches wide, but has widened out to four feet at a depth of 30 feet. There is every indication of this district being as rich as Pine Creek, and we look forward to some very rich discoveries. Eastern Oregon is bound to take the lead in mining.

QUARTZ AND PLACER.—Jacksonville *Times*, Jan. 21: Smith & Lynch are doing good work at their mine on Wagner creek. All the miners have plenty of water and are correspondingly happy. Good work is now going on at John Miller's hydraulic mine on Farmer's flat. Considerable prospecting is progressing, notwithstanding the stormy weather. The Sterling Mining Co. have an abundance of water and are now operating two pipes. If there is no more frosty weather and a fair amount of rain, a good season is assured the miners. A gold nugget worth \$62 was dug up the other day in the abandoned channel of a creek in Pennsylvania. R. Morat's claim on Foot's creek has been put in excellent condition and much work is now being done there. O. H. Blount, of Ashland, has shipped his hydraulic pipe and little giant to his mines on Cottonwood creek, Cal. Work continues steadily on the extension of the tunnels of C. C. Beekman and the Jacksonville Milling and Mining Co. Considerable snow has fallen in the mountains during the past week, which will be quite available when spring comes. A. W. Sturgiss, of Jackass creek, has his new hydraulic pipe in operation and will make a big showing at the end of the season. Klippel, Howard & Co., of Applegate, have had their ditch full for the past few weeks and have already done considerable ground sluicing. Legg & McDonnell, of Jackass creek, have a good supply of water and yesterday increased their force. Wm. Smith, of Sam's valley, informs us that Jas. McDougall, while ground-sludging in Blackwell district, picked up a nugget of gold worth \$750 this week. Chas. W. Cornelius, having purchased L. D. Brown's interest in the quartz mill at work on ore from the Swinden ledge, is now on the scene and assisting to put everything in shipshape. Paul Cirac is taking a lot of quartz from an extension on Grob and Braendel's mine on Jackson creek which will be crushed at Klippel, Baumle & Co.'s mill as soon as the road in course of construction is finished. Geo. M. Willard and H. T. Bragdon, of Ashland, have bonded the hydraulic mines of Patterson Bros. on Grouse creek, in the Siskiyou mountains, and started this week with two men to begin work with the little giant.

UTAH.

PARK DISTRICT.—Record, Jan. 22: Recorder Brennan, of Uintah mining district, has been quite busy lately recording numerous locations of new properties in that district. The new year has also witnessed many mining locations in Blue ledge and Snake creek districts. The snow in the hills is getting deeper and operations are handicapped except around the leading properties.

THE NEW YORK GROUP.—This group, comprising a block of six claims, is situated southwest of the Ontario mine and adjoining the Story group on the west. Whatever there is in good location the New York group is favored, since it is in the center, nearly of the great Ontario and Daly mining belts. The development tunnel is in about 65 feet, and as soon as the weather permits work will be resumed on it. It is calculated that the tunnel will cut the ledge about 250 or 300 feet in the hill and at a considerable depth.

ORE AND BULLION SHIPMENTS.—The Crescent shipped during the week 216,000 pounds of first-class ore. For the week just ended the Mackintosh sampler received 393,810 pounds of Ontario and 109,490 pounds of Daly ore; total 503,300 pounds. On Wednesday, the 19th, the Ontario shipped 28 bars of bullion, containing 17,251.72 fine silver ounces. Yesterday there was turned out of the Marsac mill eight bars of Daly bullion, containing 8179 fine ounces of silver.

SANDSTONE NOTES.—Southern Utah *Times*, Jan. 12: Stormont Co. is offering great inducements to chloriders to secure their ore for reduction at the River mill. Bayless & Co.'s Leaching Works started up last Monday; capacity, ten tons daily. Their ore runs from 15 to 20 ounces, of which there is enough for a long run. Kemple & Crandall have out a large shipment of ore from the Leeds mine, which will be worked by N. B. & Co. leachers. This mine is furnishing almost enough ore to keep these works employed without having to draw upon the tailing pit. Last week's ore output from the Stormont's properties was 235 tons of good grade. Bullion shipment for December footed up 12,700 ounces silver. Hessel & Thiesen delivered two tons of screenings from the old Pioneer mill to the Stormont people. During Mr. Vivian's absence J. V. Curtis is acting foreman and John Ivey, Sr., is night boss.

PARK NOTES.—Record, Jan. 8: The beginning of the new year in the Park witnessed considerable re-locating of claims, and in the dead of night several old-timers as well as some tenderfoot jumped a few unimportant and scattering claims. Relocating and jumping claims by the wholesale has, however, become a thing of the past. There was no trouble or bloodshed over carrying out the first principles of mining at the opening of the new year this time in our midst.

MECHANICAL PROGRESS.

A New Car Wheel.

Mr. Harvey W. Fowler, of Chicago, has devised a new car wheel which is thought by many railway engineers to possess decided advantages over any other wheel heretofore devised. Mr. Fowler's method consists of casting a solid integral wheel blank having a rudimentary flange, a hub and web substantially complete as to dimensions and form, and a rim which at the tread and flange is larger in diameter than the finished wheel desired; and in peripherally rolling the rim and concentrically reducing the diameter of the blank to the diameter desired in the finished wheel, and thereby evenly condensing the metal at the outer portion of the rim in radial and peripheral lines and developing the flange and hardening the tread of the wheel. There is thus produced an integral cast-steel car wheel having its hub, its web and the main portion of its rim composed of metal in its normal soft and tough condition, and a flange and tread composed of metal which is hardened and condensed in radial and peripheral lines—the entire wheel evenly condensed and solidified by rolling, perfectly circular, and finished smooth as planished iron. It is claimed that this process of rolling and condensing the metal in the tire of the solid wheel produces a tread and flange equal to hammered steel, giving the best possible wearing surface, as well as removing all danger incident to the use of a make-up or combination wheel of which the tire and center are separate and distinct parts. The metal is taken in the form of a cast blank for each wheel, heated to a temperature lower than that used for rolling steel rails, and is condensed by rolling to a form mathematically circular. So great is the pressure in the process of rolling that the diameter of the blank is reduced two inches from the size it was at the commencement of the treatment. Rolling has the same relative effect in condensing and toughening the metal that the hammer and anvil of the blacksmith have upon heated steel. The benefits of this invention are claimed to be, in substance, as follows: 1, absolute safety; 2, durability consequent upon the process of manufacture; 3, lightness; 4, certainty of absolute rotundity; 5, perfect uniformity in finish; 6, cheapness, as compared with the composite steel tire wheel.

A little over a year ago Mr. Fowler constructed a model machine with which he produced small car wheels about eight inches in diameter with the most satisfactory results, and in September last he completed the construction, at Pittsburgh, of a full-sized machine with a capacity to produce 25 wheels per hour, which, at its first trial, proved such a complete success that the Fowler Steel Car Wheel Co. was organized with a paid-up capital of \$250,000. Seven acres of ground have been purchased in Chicago, and works are now being erected which will have a capacity of 80 wheels per day. It is intended to enlarge these works as the demand for the wheels increases until they will have a capacity of from 400 to 500 wheels per day, and it is expected to have the wheel in the market during next summer. Patents have been issued in the United States and in foreign countries on the wheel and the machinery for its production.

Machinery and Inventions.

The never-ending invention of mechanical and other contrivances for minimizing manual labor leads to the supposition that, by and by, the latter will be dispensed with altogether, and that human existence will become a state of sinecure. If this consummation were ever to be obtained, however, it is pretty certain that life would become unendurable, and that mankind would soon cease to exist altogether. We have no apprehensions, says an English writer in the *Foreman, Engineer and Draughtsman*, as to the arrival of either of the contingencies in question. Machinery will ever be the handmaid of humanity, but never its destroyer; and every real improvement made therein, being only a new application of the force of nature, must be advantageous to the human family. No machine of any kind can possibly create power, and no combination of wheels, pinions, levers, belts or cranks, however ingeniously arranged, will raise a single foot-pound of power, or even one ounce. Suppose a watch he taken by way of illustration. In order to set it in action the spring must be bent and contracted by means of a key, and this imparts power from the muscles of the fingers. When this spring has given off the muscular force put into it the wheels, and hands of the time-keeper come to a standstill. Again, in winding up an eight-day clock, you lift a weight of, say six pounds, through four feet. In doing so you perform 24 foot-pounds of muscular power. These 24 foot-pounds will serve this clock 8 days; and, unless more power be applied, this machinery will stop. The same principle applies to mechanical contrivances of every kind, whether impelled by steam or by sentient bone and muscle. In fact, all work is derived from the source of nature, which, in turn, have derived their present existence and form from the workings of nature; or, to be more explicit and exact, from the heat of the sun, which has developed and is developing all the natural laws by which we are surrounded. There is no fear, then, of our getting beyond nature, nor of machinery of any kind ever add-

ing one iota to the stock of power, latent or active, in nature's arcana. We may modify and adapt, but we can neither create nor destroy; and may rest assured, therefore, that all discoveries in science and in mechanism will tend eventually to the good of mankind and the glory of the Creator of all things.

HIGH AND LOW LOCOMOTIVES.—Contrary to the generally received opinion, says two locomotives, each with wheels the same distance apart, laterally, but the one with a low center of gravity and the other with a little higher center of gravity, the latter will be least liable to be overturned when on the rails. For many years the contrary opinion was held by most engineers, and by some is so held to this day. This opinion is sustained by both practice and theory. The theory is given by the *London Engineer* as follows: The gauge of the rails represents the base of a triangle, and the center of gravity of the engine represents its apex. Now, if a side strain be caused to act on the apex of a triangle, it can be resolved into two other forces on the triangle if we regard it for the moment as a truss or as a solid body. One of these forces will create a rotating strain, resembling in effect the action on a crank, if we regard the lower corner of the triangle furthest from the pushing strain as the shaft, and the apex or point where the strain is applied as the crank-pin. The lower corner of the triangle is the turning point of the strain, the purely rotary force being equal to the amount of the applied strain multiplied by the sine of the angle at the turning point. But there is a lateral strain also, tending to simply push the triangular body sideways; and the magnitude of this stress will be equal to that of the applied force multiplied by the sine of half the top angle of the triangle or half its base. From this it will be obvious that the greater the lower angle and its natural sine, as compared with half the apex-angle and its natural sine, the greater will be the overturning or rotating force, and the less will be the lateral strain on the rail.

ALUMINUM.—The metal aluminum appears to have met with a decided advance in its application to the arts from the new and cheaper mode of its production by the Cowles electrical process now in successful operation on a large scale. The metal by this process is not produced pure, but in the form of an alloy consisting of 10% of copper to 90 of aluminum; and what is both remarkable and fortunate, this very alloy is found to be the strongest metal hitherto known, recent tests having shown the phenomenal strength of 181,000 pounds to the square inch, which is nearly double the maximum tensile strength of 70,000 pounds required for Krupp cannon, made of the best steel. The alloy is valued on the basis of only \$2.50 per pound for the contained aluminum. It is also reported that an alloy of 10 parts of aluminum with 1 part of tin has been invented by Bourbons, which is whiter than the first-named metal, and is more easily worked, beside soldering without any special preparation. Three tons of the Cowles alloy was recently ordered by one party in a single order for use in the arts.

NEW METHOD OF MANUFACTURING SHAFTING.—The plan has been proposed to manufacture rolled and polished shafting by a new method. This round bar of metal delivered from an ordinary rolling mill, while at a cherry heat, is subjected to the action of a group of tapering condensing rolls, which act peripherally and progressively upon the bar while the latter is rotating. After the bar has left these rolls, and when it is substantially free from heat, it is introduced into a die-drawing machine of suitable construction. By this double manipulation the surface of the metal is first worked in one direction for producing a condensed, scaleless surface, and then in a direction substantially at right angles to the first, for producing the finish. The shaft made according to this method is said to be of uniform diameter, and to have its surface metal condensed, hardened, and free from pits and checks.

MORE INVENTIONS WANTED.—The following enumerations of inventions wanted, which we clip from an English journal, mentions several which we have not seen called for before: Macaroni machinery, good red-lead pencils, type-writers that will work on account-books and record-books, indelible stamp canceling ink, a practical car etarator, a good railway-car ventilator, better horse-shoes, locomotive headlights, an instrument for measuring the velocity of wind currents, apparatus for measuring the depth of the sea without sounding by line, piano-lid hinge which shall be flush on the outside, good fluid India ink for draftsmen, a good metallic railway tie, an effective cut-off for locomotive, a method of alloying copper and iron, and a molding material for iron and brass casting capable of giving a mold that can be used over and over again.

TRANSPORTING HOT IRON.—A car is being constructed at the Eliza furnace, in Pittsburgh, which is to be used in conveying metal from it to the American Iron Works directly opposite. It is to be of iron, and will be lined in the interior with brick. Tanks into which natural gas will be introduced are to be added. These will furnish the heat which is to keep the metal warm from the time it is discharged from the cupola till it is taken over the bridge to the works.

SCIENTIFIC PROGRESS.

Inhabitants of Other Worlds.

The *Popular Science News* presents in a late issue an article bearing on this subject, in which it sets forth one reason why such bodies as the moon, Jupiter and Saturn could not be inhabited by beings of the same physical constitution as mankind, even supposing that other conditions governing existence there should be favorable, which is not the case. The argument in question depends on the action of gravitation at the surface of these several bodies. Thus, at the moon's surface, the force of attraction being very much less than at the earth's surface, a being constituted like man, and endowed with the same muscular energy, could leap to astonishing distances, clearing for example a three-story brick house with the same ease that he would clear a post and rail fence on the earth; the elephant would become as light-footed as the deer; a stone thrown from the hand of a thoughtless boy might fall in an adjoining county before accomplishing its mission of destruction; armies could engage each other in battle at great distances apart; and all kinds of labor would be greatly lightened by reason of the diminished weight of tools and materials. While this state of things might not render human life, endowed as we have it on earth, impossible on the moon, the opposite state of things which would prevail on Jupiter and Saturn would certainly render life, in reality, a burden. The masses of Jupiter and Saturn being so much greater than that of the earth, the correspondingly greater attractions which they would exert would so impede locomotion that unless endowed with enormously greater muscular power than he is gifted with on the earth, man would only be able to crawl along as though his feet were weighted with lead, while the larger animals in all probability would be crushed by their own weight.

Where the Cold Waves Come From.

A Chicago cotemporary, who has been shivering from the effect of the cold rains which have recently moved with such frigid force over that city, writes as follows:

This question is frequently asked, "Where do the cold waves come from?" Manitoba is generally credited with the cold waves that sweep down from the north in this longitude. We are assured, however, that this is a mistake. It is said that meteorological observations have now become so extended that evidence is rapidly accumulating to enable us to determine positively the source of the cold aerial waves which sweep across this country during the winter season. The indications are that we owe them to the area of high barometer in Northeastern Siberia, where the pressure sometimes exceeds 31.50 inches, and the temperature falls so low as 75° below zero. The pole of the greatest cold is in the neighborhood of Yokretsk, on the Lena, where the average thermometric reading in January is 41° below zero, and where the severest cold exceeds by 10° that experienced by explorers in the high Arctic regions. This is also the region of the highest barometric pressure known in winter; and from it, doubtless, proceed the waves of intense cold which play so large a part in our winter experiences. Having found out where the cold waves come from, it will be in order for science to go to work to seek and see if there are no means by which they can be diverted from their course and sent to cool some more heated portion of the globe. At all events, there are a good many people in this favored city who wish the bitter cold which reaches us in these last December days could be sent in some other direction—to Hades, for instance.

RECONSTRUCTION OF ANCIENT PERFUMES.—Two ancient Egyptian perfumes have been reconstituted through the researches of a young French professor at Lyons, who has devoted himself to studying Egyptian sepulchurs and the plants of the Nile valley. By hunting through the papyrus texts and the inscriptions on the walls of the temple laboratories, he has found the receipts for the manufacture of "tasi" and "kyphi." The former was a temple perfume, used to anoint the statues of the Egyptian Venus. "Kyphi" was more important, and, beside being used at home for the rites of Isis and Serapis, was imported into Greece and Rome after the conquest of Egypt. It then became the favorite perfume among the luxurious Greeks and Romans, who were anointed with "kyphi" after the bath and were sprinkled with the essences during the grand banquets, while sometimes it was used to perfume the wine.

THE TOTAL ECLIPSE FOR THE PRESENT YEAR.—The year 1887 has in store for astronomers a total eclipse of the sun, which can be observed from convenient stations in Europe. This eclipse occurs on the 19th of August, and the line of totality passes through Berlin and a little to the north of Moscow. The event will give astronomers an excellent opportunity to pursue their studies of the sun's surroundings. Our Government ought to make immediate preparations to send a large and well-equipped party to observe this eclipse. Excellent results might be obtained in determining the extent of the sun's surroundings by the use of rapid photograph lenses of wide angle in ordinary cameras. It is to be hoped that the matter

of this eclipse will be laid before Congress in time for suitable preparation. Congress has always shown a willingness to provide ample means for observation of total eclipses and other great astronomical events. But that body has often been so tardy that lack of adequate preparation has greatly interfered with successful observation. This lack of preparation has ever been due to the tardy manner in which Congress has acted. Observations on the total eclipse of last year were neglected by our astronomers, because a committee of the National Academy of Science reported to Congress before the appropriations were made that the time was then already too short to make the necessary preparations. American astronomers may well devote their attention to two subjects: The determination of the character and extent of the sun's vaporous surroundings, and the search for intra-Mercurial planets. This search should not be given over, for the non-eclipse of such planets has not been demonstrated, and there are excellent reasons for believing that their existence may yet be completely established.

ANCIENT CIVILIZATION.—No man can see Peru without wondering at the remains of its ancient grandeur—the industry and intelligences of the remote Incas' empires. Those people had art that the world never knew; thrift which their conquerors could not imitate; and wealth which made them the prey to every adventurer of the sixteenth century. Their temples and palaces were built of hewn stone from quarries that the Spaniards had never been able to discover, and the means by which they lifted blocks of granite weighing hundreds of tons is a problem which no antiquarian has been able to solve. They knew how to harden copper until it had an edge as keen and enduring as the finest of modern steel; they made ornaments of gold and silver as skillfully as the lapidaries of to-day, and their fabrics of wool end cotton were spun and woven as smoothly as those made by our modern looms. They surpassed modern civilization in many things, and had a system of government under which millions of people lived and labored as one family, with everything in common; knowing all arts save those of war, and worshiping a deity whose attributes were almost parallel to those of the living Christian God. Hemmed in on one side by the impassable snows of the Andes, and on the other by the desert sands, lifted above the rest of the world unknown to them, in spirit as well as fact, as peaceful as the Andean stars, they established a system of civilization to which, for the first time since creation, the equal rights of every human being were recognized and observed.

GALVANIC ACTION AND EXPANSION IN THE BARTHOLOMI STATUE.—In order to protect the Bartholdi statue against galvanic action, an ingenious insulation of the copper from the iron framework has been employed, the insulating material used being asbestos cloth soaked in shellac. The device has been managed so cunningly that in no place do the two metals come in contact with each other. It was at first feared that the durability of this statue would be threatened by the great expansion and contraction it would be subjected to under different temperatures, thereby wearing out the copper rivets, or even straining the frame. Experience so far has shown that the mottled or corrugated surface, due to the hammering the copper had received, has prevented much of the expansion that the direct rays of the sun would otherwise have caused. No two contiguous parts received the same amount of heat, and the expansion in midsummer was found to be much less than had been feared. Whether expansion and contraction will eventually produce a serious injury of any kind cannot now be decided, but the indications are not at all alarming.

CHALK FORMATION BY SEAWEEDS.—We find that attention is directed to some observations which are said to have been made in the Mediterranean sea of the manner in which chalk is formed by seaweeds. The *Lithothamnium* of the Bay of Naples were especially studied. They grow at depths of from 100 to 300 feet, a class of algae remarkably poor in organic matter, but rich in mineral constituents, among which carbonate of lime is preponderant. They grow to be as large as the hand, and then die without suffering change of form by decomposition. Living plants attach themselves to dead ones, and thus extensive deposits are formed. Beds of pure, uncrystallized chalk remain after the gradual disappearance of the organic matter, the vacancies left by which are gradually filled with calcareous substance. Beds of chalk thus formed may, under some conditions, attain great thickness.

THE BOOK OF NATURE.—"Everything," says Hugh Miller, "is writing nature's history, from pebble to planet. The scratches of the rolling rock, the channels of the river, the falling rain, the hurried fern, the footprint in the snow, and every act of man inscribes the map of her march. The air is full of sounds, the sky is full of memoranda and signatures, which are more or less legible to every intelligent human being."

ARTIFICIAL COCAINE is said to have been recently prepared, which is alleged to possess all the reactions of the natural product. It is prepared mainly from one of the many derivations of coal oil.

Roasting and Leaching of Silver Ores.

NUMBER 5—CONCLUDED.

[Written for the Press by CARL A. SCHENCK.]

The Work of the Cleanup.

On the first of each month this work begins and takes from five to six days till it is finished. The regularity of the leaching and precipitating work is only slightly interfered with as one vat is cleaned up after the other; it takes from five to six hours to pump out the precipitate of any one vat. If the capacity of the two draining tanks were larger, or if there were more than two, this pumping business could be done in one day. Under existing circumstances it takes from three to four days.

The clear hypo is first drawn off by the swinging pipe, but not quite down to the turning point; the cap is next screwed to the outlet into the pump, and all the valves closed with the exception of the one belonging to the vat to be cleaned up; the drawing end of the three awing pipes of the vat not under treatment are also put under hypo, to prevent the possibility of the sucking of air during the pumping. The precipitate and remaining hypo are now well stirred up, the drawing end is let down and the centrifugal pump put in motion, while the stirring is kept up with vigor. With the progress in pumping the drawing end is let down deeper and deeper, lifting thicker mud from the bottom, and at this period, notwithstanding the continuous stirring, the pump frequently refuses to act. The necessity arises, therefore, of diluting the mud with more hypo, whenever the pump fails, which, of course, does not contain any silver and is directly drawn from the storage vat, and of using other time-losing makeshifts. In the fourth precipitation vat, which is a new one, the plan of pumping from the bottom by means of an extra pipe has been adopted with better results.

The slushy precipitate of any one vat cannot be pumped out in one uninterrupted run, on account of the two draining vats, into which the flow from the pump discharge is from the top, not holding the entire volume of silver sulphide and hypo, if it were pumped over in one run. After the first filling the pure hypo is, therefore, allowed to drain off, and returned, by a pipe, to the leaching. When in this manner, after a couple hours, more room has again been provided, the balance of the precipitate is pumped over, and the cleaned-out vat returned to the regular work. The draining vats are provided with perforated false bottoms; from the true bottom, a pipe starts off, through which the filtrated hypo is returned, by gravity, to one of the precipitating vats. Canvas for filtering, fastened to the top of the staves, hangs loosely, with more or less folds, in and around the sides of the draining vat, and is spread out over the perforated false bottom. Each of the draining vats is, also, provided with a circular hole, about 3½ inches through, immediately above the false bottom, for the delivery of the drained precipitate to the roasting furnace. A corresponding hole is cut out in the canvas. This opening is closed by a gasket and iron plate, firmly screwed to the staves from the outside, during the period of draining. The precipitate is allowed to drain over night, whereupon it is transferred to the reverberatory roasting furnace by taking off the iron plate and gasket, and pushing the still muddy material through the open hole into an inclined wooden trough, on the bottom of which it slides down and into the furnace, through a hopper in the arch of the latter. It may be said that this is only a temporary expedient, which, in time, must make room for more suitable contrivances.

The roasted precipitate does not undergo any other metallurgical change, but is shipped as such to refining works.

MINING AT PINO.—The Laird Mining Company, James Laird superintendent, is running night and day, and gives employment to 12 or 14 men. Their output is not known, but it appears to be satisfactory. They have a pan with cross-arms and steel teeth to separate the cement from the gravel and pulverize it. They run their machinery by water with the aid of the underhoist wheel. The Lee mine, J. S. Wall superintendent, is also running day and night and employs 20 men. They have a new stamp mill run by steam-power. When they bought the mine they also bought the old S. R. Bradley ranch of 320 acres, and have made many improvements, such as repairing the stone house and barn, putting up new fences, etc. They are about to rebuild the fences around the whole place, and are clearing off the brush from a large portion and grubbing it. They contemplate setting out a number of trees and vines this winter. The Hoadley mine is leased to some parties from Sacramento, who have six men at work sinking a shaft and making other improvements. They will put more men at work as soon as the shaft is down. The Horse-shoe mine, owned by George Lee and J. S. Wall, is shut down at present, but is expected to start up within 60 days. The Klee mine is not being worked at present. It is expected that there will be several more mines opened in this vicinity within the next six months.—*Cor. Auburn Republican.*

REDUCING THE WASTE.—It is said that there is not over six pounds of waste to the largest ox now killed at a Chicago packing-house.

USEFUL INFORMATION.

A SERMON TO EMPLOYEES.—The following is a verbatim copy of a notice which the Chicago, Burlington & Quincy Company has printed, framed and sent to various shops and offices, where they are posted for the benefit of employees. The sentiment conveyed is given as that which actuates the officials of the company in their treatment of employees: "The servant, man or woman, who begins a negotiation for service by inquiring what privileges are attached to the offered situation, and whose energy is put chiefly in stipulations, reservations and conditions to 'lessen the burden' of the place, will not be found worth the hiring. The clerk whose last place was 'too hard for him' has a poor introduction to a new sphere of duty. There is only one spirit that ever achieves a great success. The man who seeks only how to make himself useful, whose aim is to render himself indispensable to his employer, whose whole being is animated with the purpose to fill the largest possible place in the walk assigned to him, has in the exhibition of that spirit the guarantee of success. He commands the situation and shall walk in the light of prosperity all his days. On the other hand, the man who accepts the unwholesome advice of the demagogue, and seeks only how little he may do, and how easy he may render his place and not lose his employment altogether, is unfit for service; as soon as there is a supernumerary on the list he becomes disengaged as least valuable to his employer. The man who is afraid of doing too much is near of kin to him who seeks to do nothing, and was begot in the same family; they are neither of them in the least degree a relation to the man whose willingness to do everything possible to his touch places him at the head of the active list."

NEW DECORATING MATERIAL.—A new material for the decoration of interior walls and ceilings is made from chemical wood fiber. The sheet or roll of chemical wood fiber of the desired thickness is taken while wet or damp, and any desired raised design or pattern is reduced in high relief by means of suitable embossing rolls or dies, after which it is allowed to dry, and may then be colored or bronzed if desired, or it may be colored in the pulp if preferred. Chemical fiber is especially adapted as a material for embossed wall coverings, as its great elasticity permits it to be very deeply embossed without liability of breaking as it is stretched, thus enabling designs to be successfully produced in high relief with a smooth and unbroken surface, while after being stretched in the embossing process the strength and toughness of the fibers will cause the design to permanently retain its form, and effectually resist any pressure to which it might be subjected in the operation of applying the material to a wall or ceiling.—*Paper World.*

THE EXPLOSION OF POWDER.—It is found that if a charge of gunpowder be placed in the chamber of a gun, the gravimetric density of the charge being unity, and if it be completely exploded before the shot is allowed to move, the state of things immediately prior to the shot being permitted to move in the power chamber, roughly speaking, is as follows: The products of explosion are divided into two classes of substances, about two-fifths, by weight, of the powder being in the form of permanent gases and three-fifths solid matter, the latter being perfectly liquid at the moment of explosion, and in an extremely fine state of division. By the combustion is generated some 730 units of heat, the temperature of the explosion is about 4000° F., and the exploded powder exercises a pressure of about 6500 atmospheres, in the neighborhood of some 43 tons to the square inch, or about 90,000 pounds per square inch, against the walls of the chamber and against the projectile, a force and power almost inconceivable.

A DURABLE GILDING SOLUTION.—A durable and beautiful gilding solution is thus described in *La Monde de la Science*: Crystallized phosphate of soda 60 parts, 10 of bisulphide of soda, 1 of cyanide of potassium, 2½ of chloride of gold and 1000 of distilled or rain water, by weight. To prepare this bath properly the water is divided into three portions, namely, one of 700 and two of 150 each. The sodic phosphate is dissolved in the first portion, the chloride of gold in the second, and the bisulphide of soda and cyanide of potassium in the third. The first two portions are gradually mixed together, and the third is afterward added. With this solution the artisan uses a platinum anode, a wire or strip, adding fresh portions of the gold salt as the solution becomes exhausted.

RAPID WORK.—Some idea of the extent to which mechanical ingenuity and efficiency have advanced may be had from the following statement: "It is now possible to construct a complete sewing machine in a minute, or 60 in one hour; a reaper every 15 minutes, or less; 300 watchcases in a day, complete in all their appointments. More important than this, even, is the fact that it is possible to construct a locomotive in a day. From the plans of the draughtsman to the execution of them by the workmen, every wheel, lever, valve and rod may be constructed from the metal to the engine intact. Every rivet may be driven in the boiler, every tube in the tube sheets, and from the smoke-stack to the ash-pan, a locomotive may be

turned out in a working day, completely equipped, ready to do the work of 100 horses." Without such machinery and the skilled labor to operate them, the civilized world of today would be an impossibility.—*Exchange.*

A DRIVING JOINT.—An ingenious driving joint that has all the movements of a universal coupling is now being introduced by the Universal Joint Company of New York. One shaft is connected with the other by two hemispherical gear wheels. These wheels are held in mesh by linkwork and segment gears that retain the spherical wheels on their centers in every position of the shafting. The joint can turn in any direction, giving any angle within a radius of 360°. The speed with which it can be driven is stated at the wide range of from 100 to 2500 revolutions a minute, making it applicable in many places where light power is used, such as for polishing, drilling, boring, and numerous places where a flexible joint is wanted.

TO DETECT BARYTA IN WHITE LEAD.—The most common adulterant of white lead is permanent white or sulphate of baryta. This admixture may be recognized by boiling a small quantity of the pigment in a glass test tube or flask with nitric acid diluted with an equal measure of water. The white lead dissolves, but any sulphate of baryta remains a white residue. The residue should be allowed to settle, the clear liquid poured off, and the deposit again treated with nitric acid and then boiled with water.

COMPOUND RAILWAY SLEEPERS.—Mr. C. Renison, of the Netherlands State Railway, has devised a means of using up old wooden sleepers. Sleepers generally fail where the rail rests, leaving a round length of about three feet in the center. Two such pieces are joined end to end by a piece of channel iron. The rail rests on the channel iron, which thus prevents it from wearing into the sleeper. As these compound sleepers have four end faces, they offer more resistance to lateral motion than ordinary sleepers.

EXPANSION OF RAILWAY TRACK.—In climates having a difference of 70° in temperature between hot and cold seasons, a railroad track of 400 miles is 338 yards longer in summer than in winter. Of course, the length of road remains the same, but expansion forces the lengths of metal closer together, making an aggregate closing up of space between the rails of nearly a yard in each mile.

TO DETECT ALCOHOL.—If any fluid is suspected of containing alcohol, add pulverized chromate of potash and sulphuric or muriatic acid and warm the mixture. If any alcohol is present, the mixture will turn green.

MINERAL WOOL has come so largely into demand that it is now made directly from raw materials placed in the furnace, and not from such ores only as will produce other merchantable products.

AMONG the many valuable uses to which paper can be put, none equals that of advertising. If properly utilized in this respect it will increase its value beyond calculation.

GOOD HEALTH.

The Health of Our Women and Girls.

[Written for the Press by JEWELL.]

A sick girl asked me the other day, "if there was any way that I could keep her feet and limbs warm?"

Poor child! thin, bloodless, suffering creature! Just when she should be strong, hearty, and happy in the health that youth demands, and should have as a birthright, she is listless, sick, and discouraged; a sorrow and a burden to parents and friends, instead of being in a condition to repay all care given her in childhood. But there is hope for her, if she begins to inquire how to keep warm, and a desire still lingers in her heart to get well. So I tried to explain why her feet were cold, what effect bloodless feet and hands have upon the rest of the body, and how to get them warm and keep them so; to all of which she listened in rapt attention, saying, "If I had only known more of these laws of health years ago, I never would have been where I am now!"

So, friends, girls who are strong and well, and mothers who have small girls growing up about you, perhaps if I tell you what I told her, you may, by trying to study God's physical laws as well as His moral laws, be able to save many a doctor's bill and much suffering through life. Cold extremities are an indication of an unbalanced circulation. If the blood does not flow unimpeded from brain to the toe tip, it is a sign that for some cause it is delayed in its progress and will sooner or later cause inflammation or congestion of some organ, thus laying the foundation of serious sickness. Therefore, the feet should be kept warm by hot foot baths, artificial heat and warm woolen stockings and thick shoes—exercise, or in any way best suited to occasion and person. Remember the blood must be somewhere; if it is not in the feet it is probably engorging the lungs, or stomach and bowels, or the uterus or kidneys are the over-

taxed organs entailing endless misery and expense upon the sufferer. If I had but three words in which to convey the most important command for the well-being of humanity, they would be "equalize the circulation," as the disobedience of that first law underlies much of the sickness and suffering of humanity. Therefore clothe the body warm, especially the limbs and feet of our women and girls—heavy flannel first, and then cotton flannel over in winter, and with loose akirt blouse, well supported by the shoulders. No ligatures should be used about the calf of the leg to impede circulation, but stocking supporters instead, and loose, thick shoes, comfortable and useful for walking.

When will women begin to dress for comfort and health rather than entirely for appearance? I fear not until they fully appreciate the real necessity for so doing, believing it a duty they owe themselves and posterity, and to their conscience, to know and obey God's physical laws. I can sympathize with the girl who dresses for appearance, but one can look nicely and yet be comfortably dressed. The beauty of health is itself unsurpassed by anything artificial in dress or appearance.

Nothing can excuse or justify a neglect of health. And when it depends upon comfort in dress coupled with duty and independence, what further argument is needed in its favor? *Los Gatos.*

DIPHTHERIA IN SAN FRANCISCO.—The frequent reports of cases of diphtheria occurring in this city within the past few weeks have led a great many timid people to imagine that we are at present suffering from an epidemic of this dread disease. To such an extent, indeed, has this belief spread that many people in the interior are afraid to come to the city, and others who have failed to hear of the supposed epidemic until reaching the city have endured a state of most uncomfortable suspense until they succeeded in getting out of town. That all such fears are groundless is proven in a number of ways. There is no denying, of course, that the diphtheria is here; it is always here at this time of the year, and, for that matter, in all large cities whenever the proper season for its development arrives, which is governed to a great extent by climatic influences; but it is here in a much milder form than usual, and, in proportion to the number of cases, the death rate from this cause is unusually low. But, people inquire, why then is it that we hear so much of the diphtheria? Simply for the reason that the regulations of the Health Department are more rigid, and cases are reported now that formerly would never have been heard of. Diphtheria also prevails quite extensively throughout the State, more generally there, as here, in a mild form, readily yielding to proper treatment. The increased prevalence of the disease in this city is attributed to the bad condition of one of our main sewers, for the drainage of which we have not had the usual quantity of rain. The excess of cases comes entirely from the vicinity of that sewer. At this present writing the disease has greatly abated—the number of cases is now not larger than usual.

POISONOUS CLAMS.—According to recent researches, it appears that clams, or mussels, are not a very safe sort of diet. Reports are often made of severe and extensive sickness due to the eating of mussels, and investigations which have been made show that the poisonous part of the mussel is its liver. The clam, as well as its relative, the oyster, is a scavenger. This is probably why nature has given it its enormous liver, to enable it to live on its gross and unwholesome diet. The liver of the clam, like the human liver, is a self-sacrificing organ, and gathers the poison of the clam's filthy food into itself, thus protecting the rest of the creature's body. The experiments made show that if rabbits, or other small animals, were inoculated with the liver of the poisonous mussels, they died in one or two minutes. A German doctor, who has been engaged in this investigation, advises that shell fish should be discarded as an article of diet, as it is impossible to tell poisonous fish from healthy ones in any other way than by trial. It certainly seems as though there were plenty of good foods among the great number of fruits, grains and vegetables with which nature has bountifully supplied us, without ransacking the bed of the ocean for these slimy scavengers.

EVILS OF OVER-EATING.—Sir Henry Thompson thinks that more than half the diseases which embitter life are due to errors in diet, and that the mischief done in the form of shortened life is greater from indiscriminate eating than from the use of alcoholic drink. An over-supply of nutrition, which must go somewhere, produces liver disease, gout, rheumatism, and various other disorders. To eat too much is a blunder, and to wash down nutritious food with nutritious drink is one of the greatest dietary indiscretions that can be indulged in, especially for persons of sedentary habits.

MUSCULAR RHEUMATISM AND TRICHINÆ.—Dr. Grawitz, assistant to Prof. Virchow, states as the result of extensive observation, with unequaled facilities, that about one-third of the cases diagnosed in life as muscular rheumatism are shown by examination after death to be due to trichinosis. The writer has met with the parasites in post-mortem examination in cases in which they must have been present for many years.

See Advertising Columns.

Passing Events.

We print an edition of 24 pages of the MINING AND SCIENTIFIC PRESS this week in order to make room for the statistical review of the mining operations of the coast for the past year. This will be found not only of passing interest but available for reference in the future as a record of the year.

After the fine rain of last week the weather hereabouts appears to have settled into a state that upholds the glories of the climate in winter. The days are warm and sunny, with no wind and a clear atmosphere.

The Legislature is in session, but they have hardly got as far as the passing of hills yet.

The Southern California mines are attracting more attention than formerly. San Bernardino and San Diego counties are in a region near where Eastern capital has concentrated of late, and this is bound to benefit the mining interests.

Oregon is advertising her mineral resources well of late. For many years her mines have been neglected, but now much more attention is being paid to them.

GREAT excitement prevails at Clayton, California, at the foot of Mount Diablo, Contra Costa county, over the discovery of gold. A miner named Stevens, who has prospected three months, found a well-defined lead assaying \$25 per ton. Over a hundred claims have already been located.

Mining Review for 1886.

A Prosperous Year.

Increased Product of Bullion, Improvements, Progress, etc.

The year 1886 has passed without the occurrence of any specially noteworthy movement or event in the mining world. But while the year has been so uneventful, the business of mining for the precious metals has been attended with generally good results throughout the mineral regions of the central and far West, where it has been prosecuted with less excitement, but with more system and energy, than ever before. Toward the end of the year the mining share market, which for a long time had been exceedingly sluggish, with limited sales and low prices, experienced a season of unwonted animation, the prices of shares in the leading Comstock mines having in the course of a few weeks advanced several hundred per cent with large transactions meanwhile. Although the excitement consequent on this deal has nearly subsided, the prices of stocks have not, as yet, receded to the low figures prevailing prior to its inauguration. Nevertheless, they are much lower than they were a month or two since, with a still drooping tendency. Being now about over, it is pertinent to observe, that this movement has resulted as all such movements do, in the enrichment of the few at the expense of the many, the losers, as usual, excreting the business of mining for their ill luck.

The Aggregate Product of Bullion

During the year under review has been large—the largest, in fact, ever made in the several countries credited with its production, having amounted to \$103,011,761. This sum is over four and a half million dollars in excess of the bullion yield of 1877—the next largest on record.

Bullion Product.

We are indebted to John W. Valentine, Vice-President and General Manager of Wells, Fargo & Co., for the following valuable statistics in relation to the product of precious metals for the Pacific Coast and Mexico:

The following is a copy of our annual statement of precious metals produced in the States and Territories west of the Missouri river (including British Columbia, and receipts by express from the West Coast States of Mexico) during 1886, which shows aggregate products as follows: Gold, \$30,773,759; silver, \$53,776,055; copper, \$9,276,755; lead, \$9,185,192. Total gross result, \$103,011,761.

As stated hitherto, the facilities afforded for the transportation of bullion, ores and base metals by the extension of railroads into mining districts increase the difficulty of verifying the reports of the products from several important localities, and the general tendency is to exaggeration when the actual values are not obtainable from authentic sources, but the aggregate result, as shown herein, we think may be relied on with reasonable confidence as approximately correct:

STATES AND TERRITORIES.	Gold Dust and Bullion by Express.	Gold Dust and Bullion by other con- veyances.	Silver Bul- lion by Ex- press.	Ores and Base Bul- lion by Freight.	Total.
California.....	\$12,670,366	\$ 673,673	\$ 918,403	\$ 563,943	\$14,690,385
Nevada.....	1,730,639		5,602,886	1,287,866	9,168,920
Utah.....	181,093		1,310		182,403
Washington.....	320,975				320,975
Alaska.....	50,000				50,000
Idaho.....	800,000				800,000
Montana.....	2,100,000				2,100,000
Utah.....	10,140				10,140
Colorado.....	3,640,000				3,640,000
New Mexico.....	3,080,759				3,080,759
Arizona.....	16,750,000				16,750,000
British Columbia.....	3,837,878				3,837,878
British Columbia.....	1,371,437				1,371,437
British Columbia.....	2,538,500				2,538,500
British Columbia.....	400,000				400,000
British Columbia.....	803,845				803,845
Totals.....	\$26,397,737	\$2,163,673	\$23,224,701	\$4,035,655	\$103,011,761

The gross yield for 1886, shown above, segre- gated, is approximately as follows:		
	Per cent.	Amount.
Gold.....	29.87	\$30,773,759
Silver.....	52.21	53,776,055
Copper.....	9.00	9,276,755
Lead.....	8.92	9,185,192
Total.....		\$103,011,761

The gross yield for 1886, shown above, segregated, is approximately as follows:

	Per cent.	Amount.
Gold	29.87	\$30,773,759
Silver	52.21	\$53,776,055
Copper	9.00	\$9,276,755
Lead	8.92	\$9,185,192
Total		\$103,011,761

Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-1886.

YEARS.	Lead.	Copper.	Silver.	Gold.
1870	\$5,234,000	\$1,000,000	\$17,320,000	\$3,750,000
1871	5,234,000	1,000,000	18,250,000	3,838,000
1872	6,238,000	1,250,000	19,924,439	38,177,385
1873	7,238,000	1,450,000	20,453,302	39,504,638
1874	7,401,045	1,450,000	23,609,132	33,688,194
1875	8,089,000	1,600,000	30,232,934	42,988,853
1876	8,076,772	1,600,000	31,636,230	43,589,833
1877	8,219,839	1,600,000	32,540,109	44,589,233
1878	8,219,839	1,600,000	32,540,109	44,589,233
1879	8,219,839	1,600,000	32,540,109	44,589,233
1880	8,219,839	1,600,000	32,540,109	44,589,233
1881	8,219,839	1,600,000	32,540,109	44,589,233
1882	8,219,839	1,600,000	32,540,109	44,589,233
1883	8,219,839	1,600,000	32,540,109	44,589,233
1884	8,219,839	1,600,000	32,540,109	44,589,233
1885	8,219,839	1,600,000	32,540,109	44,589,233
1886	8,219,839	1,600,000	32,540,109	44,589,233

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, \$26,519,323; from Marseilles, \$956,650; from Venice, \$ —; from San Francisco, \$16,553,612. Total, \$44,034,590, as against \$56,109,949, last year. Pounds Sterling estimated at \$4.84.

While the figures furnished by Mr. Valentine are, no doubt, in most cases approximately correct, we incline to think he is a little out of the way in some of his estimates. If the value of the gold and silver extracted from the mines of California last year did not exceed \$14,690,385, as Mr. Valentine makes it, then our sources of information on that point have been very misleading. Consulting such data as have come to hand, we had reason to suppose such value would have been greater by \$3,000,000 or \$4,000,000 at least. We certainly had no idea that the California output of bullion was less last year than for the preceding year, yet according to Mr. Valentine's returns, such was the case, the falling off having amounted to \$346,287. What makes such result the more surprising is that this falling off was in the silver product, the gold product for 1886 having exceeded that of 1885 by \$870,020. The value of the silver produced in California during these two years, Mr. Valentine being authority, was \$2,698,653 and \$1,482,351 respectively, showing for the year 1886 a falling off equal to \$1,216,307. From what our exchanges from the silver-producing districts of the State have to say about the output of that metal during the year, we had been led to believe that it was nearly up to that of the preceding year. We were prepared to hear of some reduction in the Calico country, San Bernardino county, owing to the destruction of the Bonanza King mill at Providence Mountain over a year ago, since which it has not been rebuilt. This company turned out more silver than any other one in that region, and its loss has necessarily made considerable difference in the bullion yield of that county, the low prices ruling for silver having, of course, had a tendency there, as elsewhere, to restrict the production of that metal. As mining operations in Inyo county, another silver-producing section of the State, appear to have been active during the past year, the yield of this metal there has presumably been kept up to its normal standard. Some little silver has come to hand during the year from Mono, Alpine and Shasta counties, with a trifle also from other portions of the State, receipts from these sources having equalled perhaps those of late years, Shasta showing some increase.

As regards the gold product of California for the year we are considering, here again we are disappointed with Mr. Valentine's figures. We can hardly believe that the sum of \$13,208,034 fully represents the gold extracted from the mines in this State last year, considering how actively and successfully the business

was carried on in every one of its branches except hydraulic washing. It is notorious that both vein and placer operations, with the exception mentioned, have been undergoing steady enlargement of late, the growth of quartz and drift mining having been the subject of general comment. The year has also been a remarkably good one for the river-had miners, nor has it, in any department of the business, been especially unfavorable. With San Bernardino and Nevada counties claiming to have produced \$3,000,000 each last year, Sierra and Amador counties \$2,000,000 each, and a score of other counties in the State known to have produced variously from \$100,000 to \$600,000 or \$800,000 each, we conclude that Mr. Valentine, in computing the value of the precious metals produced in California last year, is out of the way by three or four million dollars at least.

We are aware that over-estimates in this class of data are not desirable. This is especially true as regards silver, so many being fearful that there will occur a glut of this metal. The exaggerated reports as to the probable product of the Comstock mines worked a great injury to those engaged in mining for silver, the apprehension that it would become overabundant having had much to do in causing its demonetization in certain quarters. We suspect that the difficulty of verifying the reports of the bullion produced in the more remote mining districts since the extension of railroads into such localities is even greater than Mr. Valentine himself declares them to be. At the same time we believe he is right in saying the general tendency is to exaggeration when actual values are not obtainable from authentic sources. That this local statistician is prone to magnify the product of his vicinage is undeniably true.

Composition of Bullion.

Segregating the bullion produced in the various countries mentioned, it is found to be composed of gold, silver, copper and lead in the proportions here named: Gold, \$30,773,759; silver, \$53,776,055; copper, \$9,276,755; lead, \$9,185,192, the percentage of each metal being approximately as follows: Gold, 29.87; silver, 52.21; copper, 9; and lead, 8.92.

It will be observed on referring to the table given that the bullion of Oregon, Washington, Alaska, Dakota and British Columbia consists almost wholly of gold, that of California being made up of about 85 per cent gold, the balance being nearly all of silver. In the other Pacific States and Territories, copper and lead make up from 35 to 60 per cent of the bullion product of those countries. Even according to Mr. Valentine's showing, the gold product of California is not only larger than that of any of the other countries named, but it is nearly as large as their joint product. While the bullion made in Colorado last year is valued at \$25,000,000, the value of her gold raised barely three and a half million dollars, being hardly more than one-quarter as much as was produced in California, which still remains the largest gold-producing country in the world.

That Idaho, Montana, Utah and Colorado should have turned out last year such large values in silver, copper and lead, considering the low prices that ruled for these metals, denotes the energy with which these branches of mining have there been prosecuted, as well as the perfection to which they have been brought. It also speaks well for the mineral resources of these countries, which in these several metals are no doubt great. All of them, with the exception of Utah, made large gains in their bullion product last year as compared with the year before. As the prices of these metals are not likely to suffer any further decline, and may even be expected to undergo some improvement in the early future, the chances are that the present rates of bullion production in these countries will be maintained throughout the current year. The

Quartz-Mining Industry of California

Has during the year just closed made creditable progress, both as regards the discovery of new mines, the development of old ones and the many valuable improvements that have been introduced into the business. Never in any former year has such substantial progress or so many gains been made. The spirit of invention has been rife, bringing into existence many new processes, mechanisms and devices, the most of which have possessed more or less merit, some being of the highest utility. The

number of new ore-crushers introduced has been especially large, several of these machines combining efficiency and cheapness in a marked degree. New concentrators, amalgamators, rock-breakers, gold savers, fuel-savers and labor-savers have been claiming the services of the patent agencies and the patronage of the mining public.

Of these many novel contrivances much good has come or is likely to come, all recognizing that the quartz-mining industry with us is still in its stages of experimentation and trial, so far as ore reduction is concerned.

Being portable and cheap, a great many of these small quartz mills have lately come into use. They answer a good purpose in numerous instances, not a few of our quartz lodes being of limited extent. Through the many economies that have been effected in quartz mining,

Ore of Comparatively Low Grade can now be Worked with Profit in California.

Provided the conditions are tolerably favorable. While our auriferous quartz yields a higher average percentage of gold, perhaps, than that of any other country, we mine and reduce a great deal that does not yield over four or five dollars per ton, and some even of lower grade; of the mines in this State that work large quantities of rather lean ores with satisfactory results, the Sierra Buttes and the Plumas-Eureka furnish two notable examples. During the year 1885 the Sierra Buttes Company mined and reduced 54,479 tons of ore, which yielded, sulphurets included, at the rate of \$6.98 per ton, producing a total of \$370,263.42. The cost of mining this ore was \$4.06 per ton; milling, 56 cents per ton; management and deadwork, prospecting included, \$1.21, making a total of \$5.83 per ton, with a resultant net profit of \$1.15 per ton; total profits for the year, \$62,627.85. During the first half of the year the company ran 60 and during the latter half 93 stamps, the number that has since been running. The Plumas-Eureka Company, running 60 stamps the entire year, mined and milled 56,052 tons of ore, which yielded \$322,841, being at the rate of \$7.60 per ton. The cost of mining was here \$4.36; milling, 61 cents; management, deadwork, etc., 60 cents per ton; total, \$5.57; net, \$2.03 per ton. During the year the Sierra Buttes Company were under heavy expenses for tunnels and other improvements, a burden from which they are now in good measure relieved, nor will their extra expenses for some time to come be at all onerous. Water-power is here used as a motor; at the Plumas-Eureka mine both water and steam. There is an abundance of hie timber in the vicinity of these mines; common miners' wages \$2.50 per day; cost of living, \$6 per week. During the past seven years, while the value of the ore and the cost of handling it have been slightly reduced, the quantity mined and milled has been considerably increased. In the Sierra Buttes mine a large stock of ore of the above grade has been developed, the established reserves in the Plumas-Eureka being apparently of less extent.

During the past year the 50-stamp mill on the Grand Victory mine, El Dorado county, has been running at least part of the time, and reducing ore at a cost of 40 cents per ton, 225 tons being passed through the batteries daily. This is a friable ore, easily crushed and easily mined, the cost of extraction not exceeding 25 cents per ton, the mine thus far having been worked as an open quarry. This mill is run by water. The ore taken from the Alabama mine, Tuolumne county, yields on an average not over \$3.25 per ton; yet the owners operate the property with some profit, the ore being reduced in a 40-stamp water-driven mill, at the rate of 80 tons per day. Cost of mining, 40 cents per ton; cost of milling, 70 cents per ton. The ore here, of which a large body has been developed, is taken out through open cuts and tunnels. Other examples, similar to the above, might be cited, tending to show the cheapness with which gold-bearing quartz can now be mined and milled in California.

Even in some of our high-grade ore-yielding mines, like the Young America and the Alaska, these several items of expense are not much greater than at the Sierra Buttes and Plumas-Eureka; while at the Plymouth Consolidated mine, in Amador county, where the ore yields an average of over \$13 per ton, the cost of these items is even less, amounting to barely \$4 per ton. Here, however, the quantity of ore re-

duced is large, no less than 160 stamps running on the output of this mine.

In nothing has the business of quartz mining received such assurance of future expansion as in this ability of our miners and metallurgists to handle with profit these low-grade ores of which we have such an abundance in California. In establishing the fact that this class of ore can be utilized to advantage, we assimilate this branch of mining with those other great industries which in all countries insure steady employment to labor and command the confidence of investors because of their recognized permanence and utility. We have reached a point in the history of this industry when with the conservative capitalist large and immediate gains are less sought after than moderate, long-continued and certain ones. Rich strikes, while they create an excitement and thus tend to subserve the purposes of the speculator, are not promotive of legitimate and healthy mining.

Of course, the richer the ore provided we have it in quantity the better; and, as before remarked, there can be no doubt but the auriferous quartz of California is of higher average grade than that of any other country. Nor is this character of ore confined to a few lodes or a single locality. It occurs in all parts of our gold fields. While many of the veins in Mariposa and Fresno counties on the south are noted for the rich ores they carry, Sierra in the center, and Trinity, Shasta and Siskiyou at the north end of the main gold belt, are equally distinguished in this respect. In these counties the ores in entire districts are of this character. In the South Fork district, Shasta county, the veins are small, but they are numerous, and their entire contents yield over \$23 per ton. The ore from the mines, some 50 in number, situated in the French Gulch and the Deadwood districts, has averaged over \$20 per ton. Some of the mines in these districts, which lie along a quartz belt extending from Shasta west into Trinity county, have been worked steadily for more than 30 years, and have always yielded, as they are still doing, ore of high grade. While these are old mines, many of which have been long worked, every year and almost every month brings with them new discoveries of this kind. In this category may be classed the deposits found not long since in the East Fork and the New River districts, Trinity county; also the recent strikes made in the Osceola and in the Rising Sun mines, near Alleghany City, Sierra county, a neighborhood noted from the early day for rich finds in both placer and quartz. The Delhi and the Young America, in the same county, both opened within the past two years, have already distinguished themselves as large and profitable lullion-producers. And so California, while earning a reputation for great store of low-grade ores, is likely to maintain her fame for innumerable high-grade deposits as well.

In the foregoing connection it is pertinent to observe that, while we have so demonstrated our ability to utilize material low in the precious metals, we have also met with marked success in

The Treatment of Our Base and Refractory Ores.

Which also abound in many parts of our mineral domain, but of which but little account had until lately been taken because of our inability, through lack of experience and skill, to benefit them with profit. The business of mining and reducing this school of ores, now that we have mastered it so well, must rapidly grow into one of great magnitude and importance. For a time at first the mining of smelting ores in California was confined to Cerro Gordo and two or three other smaller camps in Inyo county. But with the discovery of this class of ore in many other localities in the State, plant adapted for its treatment is likely to be greatly multiplied hereafter. The plan of concentrating the non-smelting base ores and treating the concentrates by chlorination or otherwise is likely also to undergo here early enlargement, the localities where this will probably be most practiced having already been indicated. It may be expected, too, that increased attention will be paid to saving by concentration the sulphurets contained in our gold-bearing quartz, much of which has heretofore been suffered to go to waste.

Inquiry at the Selby Lead Works shows that the opening of new mines and reworking of old

ones has greatly increased their business in gold, silver and lead bullion. They are now obliged to increase the capacity of their works, though provision was made for this when they were moved to Vallejo Junction. They now need almost double the capacity they had when starting. Miners have discovered many ways in which they can get their ores to better advantage, and larger quantities are now received at the works. The amount of refining has increased materially, especially of Comstock bullion. A good deal of gold and silver also comes from the Cœur d'Alene region, Idaho, and some lead from Wood River. Large shipments are coming from Mexico which were formerly sent East. They found that the Selby Co. can make quicker returns and handle the bullion more satisfactorily by reason of improved facilities, and a great deal of bullion now comes here. The Selby Works are prepared to treat ore or bullion, and have every facility for handling all mining products.

Turning from vein to placer operations, we find that this department of gold mining has been fairly prospered during the year we are remarking upon.

Hydraulic Operations.

Since the closing by legal procedure of this class of mines in the central mining counties of the State, have, of course, been greatly curtailed, the gold obtained from this source having been diminished to about one-fourth of what it once was. This reduction would have been considerable greater, but for some increment in the business in the more northerly counties, where it has not as yet been interfered with by legal process, nor is it at all probable that it ever will be, as there is no agricultural or other interest there exposed to be injured by its continuance. The gold turned out from this source amounted last year to a million dollars or a little more, a sum that will no doubt be somewhat increased hereafter, as hydraulic washing is bound to undergo a marked expansion in these northern counties, more especially in Siskiyou, Trinity and Del Norte, the conditions attending its prosecution there being extremely favorable. Should the improvements projected on the Pioneer mine on the Ocean beach in Humboldt county, be carried out, a notable increment of the hydraulic product of the State would ensue, as this property, which covers the most of that remarkable deposit known as the Original Gold Bluff, is very extensive and capable, even under partial development of turning out enormous quantities of gold.

As regards the controversy between the engaged hydraulic miners and their opponents, it may be observed that the former, though now completely restrained from working their claims, do not despair of being able to ultimately resume operations, at least in part; this hope being based upon their ability to impound or otherwise so dispose of their tailings that no appreciable damage will be done to the farming lands or the navigable streams below. During the past year no hydraulic washing has been carried on in any of the districts placed under the ban of the courts. As a consequence, the hydraulic mine owners in these districts have been reduced to desperate straits, the most of them having been financially ruined. Hundreds of laborers have been thrown out of work, with little chance of getting other employment, and altogether, such a condition of things has thus been brought about as appeals forcibly to the law-making powers for relief, if by any possibility means for extending such relief can be devised. Not for many years have

The Drift Mines of California

Turned out larger aggregate or better average results than in 1886. Twenty-five to 30 years ago when thousands of men were rifling the rich chambers of the "Dead Rivers" that, situated near the surface, were easily reached and emptied of their contents, the product from this source was, of course, much greater than at present. But not probably during any one year since that period has this class of deposits yielded up as much gold as during the past 12 months, nor have the net profits on the gross production made ever been much greater. Avoiding the mistakes that formerly attended drift operations, our miners, aided by lessened expenses and cheapened labor, have been able to transform what was once an extremely hazardous business into one noted for its steady and certain returns. No branch of mining is to-day less risky or more remunerative than this.

But it is so only in skilled hands and where good judgment is observed in selecting a site for carrying it on. Without these, failures would be as common now as they ever were, nor is it long since much money was being lost through inattention to these indispensable conditions. While these hurried channels of the Pliocene epoch are very extensive and almost everywhere rich in gold, only at a few points along them can they be attacked to advantage, large sections of them being so situated that their exploitation is well-nigh impracticable. There are about 3000 hands employed in the drift mines of this State, the annual product of which amounts to about \$5,000,000. The year 1886, owing to the late advent of the fall rains, proved to be an unusually favorable one for

River-Bed Operations.

Which, as for many years past, continued to be prosecuted mainly along the Klamath, Salmon, Scott and Trinity rivers in the northwestern part of the State. Along many of the streams further south, however, a good deal of this kind of work is again being done, it having there for a long time been intermitted. The beds of these streams having been worked out in the early day were afterward nearly all abandoned or given up to the Chinese, who continued to work some of them in spots and in a limited way. Having in the course of time become gradually enriched, through the enormous quantities of tailings poured into them, these riverbeds have of late years come to be worked again quite extensively, and generally with remunerative results. The working season here extends from the time the water falls to a low stage in the rivers till they are again raised by the advent of the winter rains; it reaches, therefore, usually from the last of July to about the middle of November, it having last year been but little interrupted until January. Having been so prolonged, the amount of gold taken out was much larger than usual, reaching probably a million and a half dollars. As not much besides labor goes into this species of mining, the profits attending it are apt to be large; they are always so when the season proves favorable. During the period of active operations there are about 4000 men engaged in river-bed mining in California. Two-thirds of the number are Chinamen, who prosecute the business for the most part by means of wing-damming, this, when so conducted, being with them a favorite style of mining.

Having examined in a general way the leading branches of gold mining, going now a little more into detail and considering the affairs of this industry in the several mining counties of the State, we summarize as follows:

Amador.

Along the mother lode, the principal mineral belt traversing this county, the past has been a year of much activity. Work on most of the old mines has been pushed vigorously. New work has been commenced on a number of lodes and a fair amount of general prospecting has been done. Some foreign and still more local capital has come into the county. To the Plymouth Consolidated mine 40 more stamps have been added, making 160 stamps now running on ore from that mine. Several small mines situated near the Plymouth are being operated with fair success. A 40 stamp mill has been built and started upon the old Kennedy mine, one of the stand-bys of the district.

At Amador City the mining interests are in a flourishing condition. The South Spring Hill has increased the number of its stamps, and a 60-stamp mill is to be put on the Quartz Mountain mine, now running ten stamps. Several mine sales are reported at Sutter Creek, which means the introduction of foreign capital at that point. Amador claims to be among the first mining counties in the State, and the number of stamps crushing quartz and the large number of paying mines within it fully substantiate the claim.

Butte.

In this county fair progress has been made during the past year in quartz, river-bed and drift mining, now the only branches of the business here pursued, the hydraulic claims, with a single exception—that of the Spring Valley Company—having all been shut down by order of the courts. This company, operating extensively at Cherokee, have not been restrained from running, as they dump and retain all the heavier portions of their debris on their own ground. The Big Bend tunnel, on Feather river, after having been completed last summer, was found to be insufficient to carry all the water of that stream. As a consequence, the working of the river-bed at that point has to be postponed another year. Meantime, the work of enlarging the tunnel is in progress, and will, no doubt, be completed in time to make it available for the purpose intended next summer. This only delays but does not defeat the success bound to attend this great enterprise.

The outlook for the mining industry in Butte is, according to the *Oroville Register*, extremely flattering. The two main sources of gold remain there almost untouched, these consisting of the beds, bars and channels of the river systems belonging to an earlier geological age than the present; and the many quartz lodes that have been discovered and slightly prospected.

The deep-channel mining can only be pursued at an expense greater than the ordinary miner can afford, and hence these rich channels have been left for men of capital to open and work. As far as they have been developed they promise enormous returns, and large sums of gold will be taken from them during the next few years.

Quartz mining is yet in its infancy, and when fairly under way will give employment to a large number of men, and turn out vast quantities of gold. Capital will seek investments in mines, for they promise as certain returns and a far better rate of interest than almost any other investment that can be made.

In addition to the two grand sources named, it is confidently expected that large amounts of gold will be taken from the river-beds at Big Bend and other mines of that kind now being opened.

Within the past 10 years a number of old river channels have been opened up in this county. These are to be found chiefly along the Dogtown ridge and in the vicinity of Butte creek. At some period of the world's history a network of rivers, ravines and small gulches existed, extending from the north fork of Feather river north to Lassen Buttes, all running in a southwesterly direction. By reason of some great convulsion in nature the whole country was overflowed by lava. As time passed the melting snows and heavy rains wore gulches so deep as to erode the lava down to the beds of the ancient streams, and in these old river-beds are found immense deposits of gold. In some places it is found in such abundance that men have to see it before they can comprehend the exceeding richness of these old channels. In proof of this we need only to refer to the Magalia gold mine, near Dogtown. In one case the evidence taken on the late trial showed that this mine paid \$1000 for every three-foot run ahead. This is only one of many mines already discovered, and others are being added to the number every week.

These mines give work to a large number of men. A much larger force would be employed, and many more mines opened and worked, were it not for the fear that after men had invested their capital they would be enjoined and the mines closed down.

Now, we must have the gold that lies buried in those old channels. These mines must be opened. These hills must be teeming with crowds of strong, active miners, engaged in taking out this gold. The farmers went it in exchange for their hay, their fruits, their pork, and their beef, and they are going to have it. The farmer and the miner have each learned to his sorrow that he did a very foolish thing when he went to law, the one against the other. Instead of each benefiting the other, he simply turned his money into the hungry lawyer's hopper. The great water suit has been compromised by the principals getting together and talking the matter over. Let the farmer and the miner do the same thing. We must have the gold.

Calaveras.

Gold mining in this county continues in a healthy and progressive condition, as is evinced by the fact that nearly \$1,000,000 of outside capital has been invested in the mines there during the past year. Toward the end of the summer an English syndicate purchased the Union quartz mine, and erected on the same a 30-stamp mill with hoisting works, etc., the plant put up here having cost the company \$110,000. Several other less costly mills have been put up, and much developing work has been done. A number of old and neglected mines have been reopened, the copper mines at Copperopolis, in the southern part of the county, being among the number. Most of the mines in the vicinity of Angels' Camp have been worked quite steadily and with fair results. Renewed attention is being turned to Carson Hill, a famous mining locality in the past, and one that possesses beyond any question large intrinsic merit. Work on the extensive tunnel designed to drain the head of the Stanislaus river, near Robinson's Ferry, has been pushed with vigor, similar enterprises on the same stream having been projected.

The late purchase by the Southern Pacific Railroad Company of the San Joaquin & Sierra Nevada narrow-gauge road, with the assurance of the gauge being widened and the road extended to the timber belt, insures the development of a lumber industry that will be of priceless value to the county.

Del Norte.

Gold mining in this county is now mostly confined to hydraulic gravel washing, which is carried on at several points quite extensively. The Del Norte Gravel-Mining Company, operating on Hurdy Gurdy, a tributary of Smith river, cleaned up last year about \$65,000, a product that is calculated can be kept up for many years to come. As the gravel is rich and easily washed, the profits of the company are large. The debris question can never give any trouble here, as Smith river, which has no farming land along it and is not a navigable stream, receives the hydraulic tailings and carrying them down empties them directly into the ocean. There are rich copper mines in this county, but they have not been worked

of late; also deposits of chromic iron which in times past have yielded large quantities of this ore, some having been taken out recently. Promising indications of coal abound in Del Norte, but their extent or value has not yet been proved.

El Dorado.

A local paper, in commenting on the mining industry in this county, says: Within the past year several new quartz mills have been built and are now in operation here. Judging from the fine prospects of several quartz claims which are being energetically developed, it is quite safe to reckon upon at least a dozen more mills being built in this county during the present year.

In the southwestern part of the county quartz mining has, within the past 18 months, been sensibly revived, and with very encouraging results. On the Springfield mine, the shaft, at a depth of 1200 feet, shows a five-foot vein of \$35 ore, this vein having expanded from two feet above to its present size at the depth mentioned. A contract has been let for sinking this shaft another 200 feet, it being the purpose of the owners of this property, Messrs. Hayward & Hohart, to exploit it, as they do all their work with system and thoroughness. The Volante mine, the old McNulty, located on the same lode with the Springfield, is being emptied of its water and restored to a working condition. It is in good hands, and when rehabilitated will, no doubt, be able to continue its former favorable record.

It is evident, says the same paper, that there will be more progress made in quartz mining on the Georgetown divide during 1887 than there has been for a number of years past. There are several new mines being developed in this vicinity, which, no doubt, will prove to be valuable properties. What we most need is more capital to develop our quartz mines; the placer mines on this divide have been among the richest in California, and we believe that the time is not far distant when El Dorado will again be one of the foremost counties in the State in the production of gold.

While team mining has been carried on to considerable extent, our large lodes of low-grade ore (which will yet become our most permanent mines) have been very much neglected, as it requires more capital to develop them and erect mills, which is necessary to put them in a paying condition. With the improved mining machinery of the present day, we are satisfied that many of our mines may be made to pay very well. This divide also has many natural advantages, as there is but little snow here with abundance of timber and water for mining purposes; the California Water Co. having one of the best water storages in the State.

There are many of our mines that can be worked through tunnels and by water-power which very materially lessens the cost of operating them. Several mines in this part of the county, that have been idle for a number of years, are now being put in better condition for working than they have ever been before; and the indications now are that there will be several quartz mills erected on this divide before the close of 1887. There are a number of mines in this vicinity that we would like to speak of, and we will endeavor to do so in the future as opportunity offers.

Fresno.

There are many good quartz mines in this county, several of which are being actively and profitably worked. Still the mineral wealth of Fresno has of late been much neglected, having been partially overshadowed by her agricultural resources. Nevertheless, the gold-bearing quartz lodes here have more recently excited some interest, and a number of them have passed from the hands of the discoverers into those of mining capitalists. J. B. Haggin, George Hearst, John McNally, John Pfeiffer, G. W. Grayson and others have invested heavily, and several quartz mills have been erected, and are now turning out bullion in paying quantities. The best informed estimate the bullion output of the county this year at \$1,000,000.

Humboldt.

Although this is more of a stock-raising, farming and lumbering than a mining county, there are still many valuable mineral deposits within its borders. In the northeastern portion of Humboldt some placer mining is carried on along the Trinity, Salmon and Klamath rivers; but there is little or no quartz mining done in the county. The Pioneer mine, located on the ocean beach, in the western part of the county, covers most of the locality known as Gold Bluff, and is considered a very valuable property. Heretofore, the only mining done at this point has consisted in gathering the auriferous sand exposed at low tide, and packing it up on the beach and there washing it in sluices. This, though a remunerative business, is so disproportioned to the productive capacities of this deposit that the owner has had the line of a ditch surveyed and located, with a view to bringing in water and conducting washing operations by the hydraulic process, and on an extensive scale. When this is done, a large and profitable production of gold can be here counted upon, as the bulk of the gravel, which extends over thousands of acres, is known to be rich. That the projected enterprise comprises the elements of a great and permanent success, admits of no doubt.

Inyo.

While Inyo contains within her borders more mineral territory as well, perhaps, as a greater variety of mineral products, than any other

county in the State, it has, by reason of its remoteness and its difficult access, been until recently kept in the background. With a railroad traversing it centrally and connecting it with the outside world, the mining industries of Inyo have made considerable progress, their outlook being at the present time decidedly good.

Up to 1883 the county was credited with an output of \$14,850,000 in silver, gold and lead. The product is steadily expanding now, but as most of the ores are shipped out by the Carson & Colorado railroad, there remain no means of ascertaining the product, unless Wells, Fargo & Co. gather the statistics elsewhere. The new marble works near Swansea have developed a most important and lasting industry. The horate fields are absolutely inexhaustible, one firm alone having obtained title to over 100,000 acres. As the railroad is extended to connection with the Southern Pacific, through the southern districts, the mining interests will forge ahead, securing for Inyo the distinction of being the second silver and lead producing county of the State.

Kern.

Which once turned out considerable bullion, has of late years fallen into the sere and yellow leaf as a gold-producer, agriculture, in its various branches, having here, as in Fresno, come to outrank mining. The failure of the big mill erected at Kernville several years ago put a damper on quartz mining in this county, from which it has not yet recovered. The coming in of sulphureted ore at the line of permanent water in the rich small veins on White river, causing work to be suspended, was another discouraging circumstance in the history of quartz mining in Kern, the work suspended on these mines many years ago having only in a few instances since been resumed. With the improvements made in handling this class of ore it may be expected that mining in this county will undergo early revival.

Mariposa.

Having like Kern lost caste as a mining county, is again coming to the front, its resources in this direction being large and favorably situated for development. The disastrous results that many years ago attended the mining enterprises inaugurated on the great Fremont estate, tended to weaken confidence everywhere in the mineral resources of this county, this feeling of distrust having been greatly intensified by the Hite Cove swindle, perpetrated more recently on Eastern parties, and from the effects of which Mariposa has not yet fully recovered. This Hite's Cove mine, having fallen back into the hands of the original owner, is being cleared of water and restored to condition to be worked again, additional machinery having been provided for the purpose. The damage that this fraudulent sale has worked Mariposa ought to admonish miners everywhere to look after and defeat these fraudulent transactions. Heretofore mining interests have been clogged in this county by defective titles, but such difficulties have been removed in most cases, especially with the Mariposa grant, covering 49,000 acres, and now good titles can be given.

Mono.

Concerning mining matters in Bodie, the principal camp in this county during the past year, the Bodie *Miner* remarks as follows:

Although Bodie district has not been so prosperous during the year 1886 as in some previous years of the decade just closed, still it has not been so bad as it might have been, or as was predicted by some of the old croakers at the beginning of the year.

Of the 130 stamps, belonging to the district, the Standard Con. has kept 15 running throughout the year. The Bodie tunnel employed 15 stamps five months; the Bodie and Mono 10 stamps four and a half months; the Bulwer Con. 15 stamps three and a half months; the Con. Pacific 4 stamps 10 days. John Wagner's tailings mill was employed about four months during the year. The Noonday mill, with 40 stamps, the Spaulding with 10, and the Syndicate with 15, were closed down during the entire year. The old Standard was run some on tailings.

When we take into consideration the idleness on the part of so many of our mines and mills, and the limited number of men who have been employed in the mines of the district during the year, the showing is not a very bad one for a camp that has had the bottom so completely knocked out of it by the pessimists as has Bodie. This district is not dead yet.

The following table shows the total amount shipped from each source from 1876 to Dec. 31, 1886:

Standard Con.	\$10,446,270 03
Bodie Con.	4,046,743 33
Noonday	1,023,289 50
Syndicate	554,711 21
Bulwer	428,738 77
Bechtel Con.	206,530 87
Bodie Tunnel	219,804 72
Wagner's Tailings Mills	50,500 61
Belvidere	25,901 26
Virginia Creek Hydraulic	21,300 00
New Standard	17,714 76
Oro	14,155 66
Mono	132,868 08
Concordia	5,670 33
Mexican, Red Cloud and Kate Rogers	12,500 00
Sitting Bull	3,485 00
Red Cloud	1,927 50
Dudley	1,746 06
Boston Con.	1,331 00
Shipments by banks	112,937 00
Scattering shipments	312,394 83
Con. Pacific	1,530 52
Total	\$17,661,599 18

The following table gives the total shipment

from this district each year, from 1876 to Dec. 31, 1886:

1877	\$ 797,022 80	1882	\$3,217,780 24
1878	2,129,732 58	1883	1,562,067 08
1879	2,576,837 58	1884	1,144,883 96
1880	3,063,699 13	1885	449,765 95
1881	3,172,754 71	1886	520,455 15

Total.....\$17,661,599 18

It will be seen by the above that the shipments for 1886 amounted to \$76,589.20 more than for 1885.

Of the above production of over seventeen and a half millions of dollars, the following amounts have been disbursed as dividends to the stockholders by the companies named:

Standard Con.	\$4,425,000
Bodie Con.	1,695,000
Bulwer Con.	175,000
Syndicate	80,000
Mono	12,500

Total.....\$6,387,500

Nevada

Continues to hold the position which she has always enjoyed of being the banner gold-mining county of the State. Being the site of the principal hydraulic operations, the closing of this class of mines has largely diminished the output of gold from that source; still the annual product of gold is kept up to the normal standard of late years—about \$3,000,000—this being due to the increased yield of the quartz and drift mines.

Concerning the condition and prospects of the mining interest in this county during the past year, we copy this following from the *San Francisco Chronicle*, being an article prepared for the annual edition of that paper by the editor of the *Nevada City Transcript*:

The litigation so vigorously prosecuted for several years past by the people of the Sacramento valley to compel the cessation of hydraulic mining in this part of the State because of injury wrought to the lowlands by sending down upon them the debris that results from this method of gold mining, for a time seriously retarded Nevada county's progress by throwing out of employment hundreds of well-paid laboring men, many of whom were compelled to go elsewhere in search of situations whereby they might earn a livelihood. But the county's resources are too abundant and varied to permit of the suppression of even so important a branch as hydraulic mining resulting in irreparable damage. Her quartz and drift-mining enterprises have received added attention, never before being as energetically and successfully prosecuted as now. Nevada City and Grass Valley, which towns are but four miles separated, and contain a population of some 13,000 people about equally divided between them, are the center of a region whose richness as a gold-producing district is equalled by its horticultural and agricultural productiveness. The Providence, Wyoming, Nevada City, Idaho, North Star, Empire and other veteran quartz claims that have for years been producing mineral wealth, continue to give forth an unflinching stream of riches, and new producers are at satisfactorily frequent intervals being added to the list and helping to swell the total output. These two towns are, beyond doubt, immediately surrounded by the most productive and permanent gold fields of the country. With one or two exceptions, the mines are under the control of "close corporations," and it is impossible for outsiders to obtain any information as to their profits; but it is plainly discernible that the most of them are paying largely.

Washington district, about 20 miles in a northeasterly direction from the county seat, continues to prosper. The Yuba, Eagle Bird, Spanish and other large quartz mines there are being worked with the best results. It is but a few years since quartz mining was systematically prosecuted there, and now the yield of bullion is large and regular. The quartz-mining outlook in the vicinity of Graniteville is also improving. The revival of operations last summer at Meadow Lake district has not yet led to any substantial returns, but the experiments made with a view to ready and cheap reduction of the refractory ore by aid of electricity give every promise of accomplishing the desired end in good time. The gold is undoubtedly present in the ore in paying quantities, but how to separate it from the base matter in which nature has locked it has long been the stumbling-block to scientists and metallurgists.

The Derbec and Mahel drift mines at North Bloomfield are yielding well and give lucrative employment to many men.

Placer.

Placer, which adjoins Nevada county on the southeast, though not, like her neighbor, a banner gold-producer, belongs, nevertheless, to the "old guard," having an honorable record reaching back to pioneer days. While quartz mining reaches here very respectable dimensions, being actively prosecuted in the vicinity of Newcastle, Auburn and Colfax, it is subordinate to drift mining, as it was also to hydraulic mining when this industry was enured to be carried on here. Drift operations in Placer are conducted on a large scale, this county contesting with Sierra for supremacy in this branch of mining. As the Colfax divide is the theater of the principal quartz-mining operations, as it was also formerly of the largest hydraulic washings, so is the Forest Hill divide, the site of the most important drift operations, which extend along the ridge for a distance of 15 or 20 miles, Iowa Hill, Forest Hill, Bath and Damascus constituting their chief centers.

Plumas.

This is another county of mixed mining industries, quartz at the present day, however, largely predominating. More than two-thirds of Plumas lie in or beyond the high Sierra, a position that places the portions of it so situated to some disadvantage, both as regards accessibility and climatic conditions. As a consequence, the mining industry has in that section been somewhat retarded, notwithstanding its large mineral resources. The Plumas-Eureka Company, whose mine is located in the southern part of the county, have been running their 60-stamp mill steadily throughout the year, making their usual production of bullion, which amounts annually to about \$250,000. They employ 200 hands and have their mine well opened with a good stock of medium-grade ore in sight. Among other vein mines that have been extensively developed and are being profitably worked here are the Green Mountain, the Miller, Gencese, Arcadian, Lucky, Indian, Granite Basin, etc.

These mines are also supplied with mills, there being beside a number of arrastras run in the county. Some of the richest and most promising quartz veins in Plumas are located in the vicinity of Eagle gulch, about 12 miles from Quincy, the county seat. Although but little has heretofore been heard of this district, its solid merits are beginning to attract attention, the agents of one of our mining magnates having lately been examining some of the mines there with a view to investing in them.

A good deal of drift mining is also being carried on in Plumas, the sites of these operations being mostly along the north fork of Feather river and its tributaries. Some gulch washing and ground sluicing are also done in different parts of the county during the wet season.

San Bernardino

Has within the past few years been brought to the front as a mining county, the Calico silver-producing region, located near the center of the county, having given it prominence in this respect. There are also gold mines, both placer and quartz, in various parts of San Bernardino, Holcombe valley being the most important placer-mining center in the county. In this valley are found extensive bodies of rich hydraulic gravel some of which are about to be worked on a large scale, an English company having made preparations to that end.

The value of the silver turned out in this county, the most of it coming from the Calico country, amounted last year to about \$3,000,000, a product that, it is believed, can be kept up and even increased for many years to come, now that improved methods for treating the low-grade and refractory ores there have been brought into use. Among these methods the leaching process is the most prominent, constituting, in fact, a new departure in that country.

Through the introduction of this plan and other improvements lately effected, the mining properties of Calico and the silver-producing districts adjacent have been greatly improved.

San Diego.

Touching the mining interests and industries of San Diego, it may be remarked that quartz is the principal branch of mining carried on in that county, the Julian district being the chief center of the business. Many old mines are now being successfully worked. The Rsady Relief mine, 10-stamp mill, turns out \$26,000 per month. The Owens mine pays \$15,000 to \$20,000 per month. The old Stonewall mine has yielded about \$130,000 the past year. A number of other mines are being worked with profit.

Shasta

Has within the past few years come to be a very live sort of mining county, the quartz industry, as the placer diggings gave out, having received a great impetus. As evidence of the waking-up that Shasta has experienced, and the progress that mining has made there lately, we quote as follows from a local paper:

No vocation or industry has received such an impetus or been so lucrative and of permanent benefit to Shasta as mining. All her other resources have not added as much wealth to the county as mining has in the past 15 months, or put as much money in circulation. We assert that these statements are easy of proof. Being familiar with nearly all the mining sales that have been consummated within the period of time mentioned, we are able to safely say that the sum total invested in the purchase of mining property in this county, including Deadwood, will foot up not less than \$300,000, and if anything, beyond that figure. Add to this \$250,000 invested in new mining machinery, and the thousands of dollars expended in developments, and the actual cash value of good mining property that has been opened, and the gold bullion produced in the past 15 months, and we have an increase in wealth from this industry alone, that when seriously contemplated is astonishing and surprisingly large.

Sierra.

No mining county in the State has during the past few years so forged ahead as Sierra. In every department of the business, save hydraulic washing, here also suppressed, she has made rapid and solid progress. In quartz mining she has notably distinguished herself, some especially promising mines having lately been developed here, the Young America eclipsing anything recently brought out. It is reported that they have now opened up in this mine an ore body 900 feet long and six feet wide that

will mill \$30 per ton. This is a bonanza, and if it hold even to a moderate depth must give great value to this property, which with a small number of stamps continues to make an average monthly production of about \$30,000. The Sierra Buttes mine in the same locality has kept its 110 stamps steadily dropping on ore the year through, making its accustomed large output of gold bullion, an outlook that may be looked upon as assured for many years to come. The Alaska and a dozen other standard mines in Sierra have also been running with good results. Some new mineral developments of importance are also announced in this county. While the most of these have been made in the northern and more central parts of the county, others of great promise have occurred on its southern border, these latter strikes being in the Sunrise and the Oscola mines already alluded to.

Sierra has from the first been conspicuous as a drift-mining county, this being the site of the famous Bald Mountain, and of the now hardly less famous Bald Mountain Extension claims, the latter having come into bonanza as the former went out. The original Bald Mountain ground, without being yet exhausted, has, after yielding nearly \$3,000,000, suffered such impoverishment that it returns now but small net earnings. The claim of the Extension Company is, however, yielding largely, the owners for some time past having been in the receipt of liberal dividends. There are many other drift claims in the county that are being worked with great profit, not to mention the much larger number that are paying at least fair wages.

Siskiyou

County, though most noted for its hydraulic and river-bed operations carried on chiefly along the Klamath and its branches, possesses, at the same time, great resources in quartz, an element that is destined to add immensely to its prosperity, notwithstanding it has, up to this time, been greatly overlooked. Such neglect of vein mining in Siskiyou has been due mainly to the fact that this county has, until recently, been difficult of approach, long wagon transportation over mountain roads having rendered the conveyance of machinery tedious and costly. Then, too, the exceeding richness of the placer deposits have tended to delay the advent of vein mining, the early population being abundantly satisfied with the yield of the former. But now all this is changed; the placers are pretty well depleted, and the railroad having arrived in this border county, places it in easy communication with San Francisco, rendering the importation of machinery and all other needed supplies cheap and speedy. With this there comes a revolution bringing the rich quartz mines of Siskiyou into requisition and insuring for the county greater progress and a more permanent prosperity. Already the prospector is abroad; the expert has put in an appearance; new mines are being located and work started on the old ones, the outlook for this county being flattering indeed.

Trinity.

Besides a great extent of placer and hydraulic deposits, Trinity contains many valuable quartz veins, the most active and promising localities in this department of mining being the Deadwood, Bullychoop and the New River districts, in all of which mills are running and many fine mines are being worked or opened. Hydraulic mining is also prosecuted largely and profitably, it having here met with no protest or complaint.

Tulumbne.

Mining, after being for a long time much depressed in Tulumbne, has lately undergone there a manifest improvement, especially along the Soulesby quartz belt, lying to the east of Sonora, as well as along the mother lode, which strikes centrally across the county. There is at the present day but little mining other than quartz carried on in Tulumbne, but with this latter industry so restored the mining outlook for the county may be considered good.

Yuba.

The cessation of hydraulic operations, once very extensive in Yuba, leaves the mining industry of this county so emasculated that not much remains. There are a few quartz mines being worked here, some of which are yielding well. Some exploratory work is also being done on others, and it may be that this branch of mining will yet grow into importance in this ancient but lately unfortunate mining locality.

There are a dozen other counties in this State containing mineral deposits of various kinds, such as iron, copper, lead, antimony, quicksilver, etc. Some of these are also quite rich in the precious metals, but their store of these is yet limited.

Minerals.

The principal receipts of minerals at San Francisco during each month of the past year were as follows:

MONTHS.	Quick-silver, Flasks.	Lead, Lbs.	Borax, Ctl.
January.....	1,872	49,950	5,794
February.....	1,209	27,000	4,809
March.....	2,223	11,000	6,015
April.....	1,035	3,643
May.....	1,335	8,151
June.....	1,672	5,255
July.....	1,257	6,300	5,169
August.....	1,413	2,400	5,065
September.....	1,090	300	6,407
October.....	994	7,010
November.....	1,655	740	10,515
December.....	1,405	1,100	6,787
Totals 1886.....	17,320	98,850	77,929

From the above table it appears that 12,161

asks of quicksilver having been shipped direct to points of consumption, failed to be reported at San Francisco.

About two-thirds of the borax produced on this coast comes from the salines of California; the balance from those in Nevada. According to the estimates, the quantity of this salt made last year was less by some 2,000,000 pounds than the quantity made the year before.

Copper Mining in California.

For the reasons that have tended to curtail copper mining elsewhere, the business has of late years shrunk to comparatively small dimensions in California, both as regards reduction and shipment of ore. The production of metal does not now exceed 800 tons of cement per year, little or no ore being exported from the State. About 500 tons of the above product comes from the mines of the San Francisco Company at Spenceville, Nevada county. The method of procedure here is by roasting the ore in open piles, leaching the sulphate formed and precipitating by scrap iron, the precipitates obtained assaying between 85 and 90 percent copper. The balance of the copper produced in California is turned out mostly from the several small mines situated in the vicinity of Campo Seco, Calaveras county, the process in use here being similar to that employed at Spenceville, except that the roasting is done in furnaces. A smelter was also in use here at one time, but it has not been running of late. With some improvement in the price of this metal, copper mining would be revived in California, as we have medium-grade ore here in great abundance, while our facilities for mining and handling the same are superior to those enjoyed by our neighbors.

The business of prospecting for and producing petroleum was prosecuted in California last year at several points with great energy and generally good results. This business has, in fact, developed here into a great and permanent industry, the quantity of crude petroleum raised last year having amounted to 11,000,000 gallons, part of which was refined, part used as fuel and the rest as a lubricator.

The price of oil fell four to five cents per gallon. Great developments are expected during the present year. Nearly one-half that used for illuminating purposes on the coast in 1886 is said to have been California oil.

The salt crop of this State, the most of which is made at the works on the Alameda shore of the bay, fell off last year to the extent of several thousand tons, a result due chiefly to the unfavorable climatic conditions of the season. The year's product is estimated at 27,000 tons. The price of this article continues low and importations limited.

NEVADA.

The State of Nevada, for many years at the head of the list of bullion-producing States, is now eclipsed by Colorado and California, but her product is by no means insignificant. People, since the bonanza days of marvelous richness have passed, have come to look upon the Comstock as a thing of the past. This is by no means the case. Several of the mines are producing as much bullion monthly as would make the reputation of a new territory. There are not very many mining camps that eclipse it now. Leadville, in Colorado, and Butte, in Montana, are now the leading camps. The Comstock is still turning out its thousands every month, however, and bids fair to do so for a long time. They are good miners up in that region, and good metallurgists, and they are bending all their energies to accomplish the successful working of low-grade ores, of which the old lode can yield hundreds of thousands of tons.

The recent revival of mining affairs on the Comstock, and the increased yield of the old bonanza mines—Con. California and Virginia—is still fresh in the minds of the public. The resulting mining-stock excitement has not yet subsided. Many old mines not worked for years have been started up, and vigorous prospecting is being carried on in every direction. Now that the lower levels have been given up to the water, they are working out ore above that was passed in more prosperous days. There is something like 30,000 tons of ore a month worked in the Comstock mills, and the resultant bullion has a large proportion of gold. Experiments in various directions for saving expense are now being conducted, and the old lode may yet give an account of itself which will surprise many. In the days of "bonanzas" on the Comstock, \$50-ore was said to be worthless. Improved machinery and the thorough understanding of mining has changed matters to such an extent that \$15-ore in a body is good.

In Nye county the mining outlook for this year is decidedly encouraging. The Belmont Courier says that at Spanish Belt the Barcelona mine gives promise of continuing to produce extensive quantities of rich ore. This ore, when extracted, is shipped to Eureka or some other point for reduction. All who have worked in the Barcelona pronounce it one of the greatest undeveloped mining properties on the Pacific Slope. It will be opened in a thorough and systematic manner some time in the near future. In the mines of East Belmont a resumption of work is probable, and as they have all been bullion-producers, good results may reasonably be expected. Jefferson district will soon awaken from its lethargy. The principal mine there—the Jefferson—has passed into the hands of Superintendent T. A. Oliver, of the Chicago Mining and Reduction

Company of Ophir Canyon. Years ago the Jefferson paid dividends to its stockholders, and will do so again when worked as a business proposition. Mr. Oliver has secured a valuable mine. The mines of San Antonio are being worked and shipments of ore will be made during the year. At Ophir the promise for a busy year is strong, and increased bullion shipments are almost certain to gladden the hearts of the stockholders of the Chicago Mining and Reduction Company. Lodi also gives promise of becoming a bullion-producing and prosperous camp again. It is expected that work will be resumed in the leading mines there early this spring. Those who have pinned their faith to the mines of Ellsworth say that work will soon be resumed in that once lively burg. Downeyville is still in the ring and will be heard from in the early spring. Tybo will surprise the oldest inhabitant by the extent of its bullion shipments, and its liveliest days of the past will be considered but a circumstance compared with those that are to come. Reveille will also continue to yield its rich ore to the patient efforts of those who have stayed with its mines. In Mantattan district an English company will work some valuable mines. Grantsville, too, and Ione will be added to the list of bullion-producers, and then will set in an era of prosperity that will astonish the worst croaker ever seen in the county of Nye.

Outside of the Comstock the region down along the Carson & Colorado railroad has many camps with good prospects. Many of these, says the Walker Lake Bulletin, are becoming producing camps. Large quantities of rich ore are now shipped from Santa Fe, and in Moss district, within a few days, new discoveries of rich gold-bearing quartz have been made.

Garfield district is still improving and has enough in sight to assure a steady output for a long time. Hawthorne district, in which is situated the Lapanta, never had so brilliant an outlook. The Lapanta, steadily improving, is now one of the most valuable gold mines on the coast, and exhibits enough ore in its reserves to guarantee years of profitable working. The North Star Consolidated Company has developed a mine which is attracting attention from all directions. Coryville has a future before it now which will eclipse its first boom. The ledge now uncovered is there to stay and a large addition to the bullion product will come from this, the pleasantest place on the coast for a mining camp. Palmetto and Silver Peak are beginning to be looked upon as lively camps, and Candelaria will soon be again one of the liveliest mining camps on the coast.

From the Esmeralda News, a new journal, we take several items relating to Nevada camps: The Silver King mining district is 25 miles in a southwesterly direction from Hawthorne. Levi Smith is the owner of a very promising silver mine in this district named the Oriole. The ore is of average grade and in large, extensive bodies. Considerable work has been done on this mine.

The Tiger ledge, owned by Tom Purcell, is from eight to ten inches wide, and its average value per ton is \$50, exclusively gold.

The prospects are that there will be plenty of employment for laborers very soon. The mines of Columbus district never were more promising. There is plenty of good ore in sight in the Holmes, Diablo and Georgene mines. The new mill, at Candelaria, is running on ore from the latter, while the Holmes and Diablo have all their outlets filled to the utmost of the best character of pay ore. The Diablo company is now erecting a 10-stamp mill at Sodaville.

Work on a small scale has been resumed on several of the mines of Marietta district, and the chloriders are extracting therefrom some very rich ore which will soon be shipped for reduction. There is a good 10-stamp mill there in close proximity to the mines and only 10 miles distant from the Carson & Colorado railroad, at the town of Belleville.

The Lake View mining district extends north of the Mount Cory district and west of Walker lake, which includes the mines situated near the top of Mount Grant. In 1877 the General Grant Mining Company, a corporation, owned and operated mines in this district, but owing to the lack of cheap transportation and disagreement between the stockholders and managers of the company they suspended work. Since that time the railroad has been built and it is rumored that this company will soon resume operations.

Moss district is in the Gillis range of mountains on the north of the railroad line. Gold was first discovered therein in 1883, which was taken from the Sierra mine, a parallel claim to the Montreal, owned by Joshua Moss, from whence the district derives its name. The Sierra ledge is small and may be more properly considered a specimen mine, from the fact that it has produced the finest specimens of gold quartz. The Cumberland mine, in this district, is situated about six miles from the Kinkead mill. The ledge is flat and varying from 10 to 12 inches in thickness. Very little work has been performed on this claim, owing to the fact of its being a very recent discovery.

The Montreal has furnished a considerable quantity of rich gold ore which has been worked in the Kinkead mill.

Alex. Morrison and John Warner have leased the Toronto mine from Joshua Moss, its owner. There was no ore in sight at the time they began work, but on sinking at a depth of 20 feet they encountered a ledge of very rich gold ore, 12 inches thick, and continued sinking thereon to a depth of 75 feet, from which point they

ran a drift south about 30 feet. They have between 25 and 30 tons of fine ore on the dump, valued at \$100 per ton, which they contemplate shipping to the Reno Reduction Works. This mine is within two miles of the railroad at the Kinkead mill.

The Garfield mining district adjoins Hawthorne district on the east, and is about 12 miles from the line of the Carson & Colorado railroad at Sodaville. The Garfield Mining Company, Limited, employs about 50 men and is working the Western, Atherton, Lancashire, Manchester and Ahs Lincoln mines, taking therefrom between 20 and 30 tons daily of rich ore. The Garfield mill is 10 miles distant from the mines and is kept constantly running on this ore.

The Hinley mine, which is an extension of the Western, employs 12 men, who take out daily about nine tons of ore which runs up into the hundreds of dollars to the ton. Teams are kept busy hauling this ore to Hawthorne, where it is shipped on the Carson & Colorado railroad to Dayton and the Reno Reduction Works for reduction. They have an enormous quantity of low-grade ore on the dumps.

In southern Esmeralda the mining outlook has not been so bright for many years. At Old Camp, in Gold Mountain district, are more men, greater industry and enterprise, and better developments being made than in any district south of Silver Peak. During the last summer, B. F. Leete, of Reno, secured a number of mines, and has a mill there, almost completed, for the reduction of his ore, which is chiefly gold-bearing. The owner will also do custom work, thus affording chloriders and tributaries an opportunity of realizing on their labor.

A. P. Anderson is the only hullivan-producer as yet in the district. His steam arrastras have all the work they can do.

At Lida Valley district few claims are being worked, among which is the Death Valley mine, by Keiser & Tracy, who crush their ore at R. H. Stuart's five-stamp mill. Louie Teyhen & Co. are having work done. The latter made a shipment of ore to San Francisco recently that yielded \$180 gold per ton, the largest percentage of gold ever taken from this mine. There is much confidence expressed that two New York companies that own valuable mines in that district will very soon commence active work upon their properties.

The Mount Diablo Mill and Mining Co. having decided to build a mill at Sodaville, on the line of the railroad, some 20 miles from its mine, is pushing the work with vigor. The mill is to be of 10 stamps, with a plain cylinder roasting furnace, six pans and three settlers. The company expects to have the mill ready to crush ore before the first of April next. Through the use of its new mill, the Mount Diablo will save five dollars per ton on its ore, and its output will be entirely free from interruptions.

Aurora, which showed signs of great advancement last year, is again under a cloud, caused by the closing of the mines owned by the English company. However, the dull times are only temporary, as the Silver Lining will soon begin producing hullivan, and there is no doubt that the English company will resume operations in a short time. Although Aurora has frequent spells of business depression, the people never get discouraged.

John Centras, owner of the Centras mines, near Grantsville, Western Nye county, is endeavoring to make arrangements to have 1000 tons of ore from his mine worked at the mill being repaired by the new company at Knickerbocker Canyon.

In Northern Lander, according to the *Central Nevada*, the prospects are bright. Rich discoveries are being made in Galena, Lewis and Old Battle Mountain, as the work of development progresses, and the ore product warrants the opinion that those places are deposits of wealth. That there are mines in either of those places that would produce enough ore to keep in operation extensive reduction works is no longer a matter of speculation, but an assured fact. In Lewis, the Pittsburg Gold Mines have in the last two years produced nearly \$200,000 in gold bullion, with two little Huntington crushers in the mill; while other mines in the same locality would do nearly as well if they had the facilities for reducing their ores. The Humming mines at Galena have produced a large amount of hullivan, and yet have in sight thousands of tons of gold ore, that can be reduced for \$4 per ton. Other mines there have shipped large quantities of rich ore to Reno and Selt Lake for reduction that, notwithstanding the high freight, yielded a handsome profit to their owners. With such great inducement for investment, capitalists will not long stand aloof, but will avail themselves of the opportunities offered them here to invest their money in legitimate mining, that will by honest management pay handsome dividends to the investors.

In Eureka district the Eureka Consolidated is turning out the usual quantity of ore. The furnace and refinery are running well and producing bullion.

A Hamilton (White Pine county) correspondent, writing to the *Eureka Sentinel*, says: "The mining outlook in this part of the county is very encouraging, and by spring the Sweetwater Company will have ore in the orehouse at the Stafford and Wheeler tunnel sufficient to keep their mill pounding away for months. The Percell mine on White Pine mountain is showing up finely, and it is the intention of Eugene N. Robinson, Managing Director of the Sweetwater Co., to put up concentrators, and will erect a 60-ton furnace this spring. Mr. Robin-

son is now on his way to London, where he is to meet capitalists who desire to become interested with him in mining in this State. He has bonded the Cortez mine from Mr. Wenhan for a large figure."

At White Pine they are experimenting on treating the low-grade ores by the pan process without the aid of chloridizing furnaces. It is said they have demonstrated the success of the process. It is a well known fact that immense bodies of low-grade silver ore lie exposed in and about Treasure Hill, and the question has long been agitated by mining men as to whether these ores could be handled so as to pay a profit over and above the cost of mining and milling. In early days rock from such mines as the Hidden Treasure, Eberhardt and Aurora, Ward Beecher, Silver Wave and others, assaying on an average \$50 in silver per ton and over, did not appear to distribute much money in the form of dividends to shareholders, as these ores were seldom if ever worked above 76 per cent, and in many cases not to exceed 50 per cent of the assay value was extracted; the tailings, after leaving the mills, assaying from \$20 to \$25 per ton. The Eberhardt mill worked something like 100,000 tons of ore, the tailings from which, before being reworked, assayed on an average \$13 per ton. At the time this milling was done it was considered good close work, as much of the ore was extremely refractory, carrying a high percentage of manganese, antimony and sulphides of silver, which combination all practical millmen know to be difficult to amalgamate with mercury. Samples of the most refractory ores from the mines of Treasures Hill were worked in the Smokey mill last season with success, the tailings denoting a working percentage of from 87 to 95 per cent on all grades of ore.

At Pioche a leaching plant of 60 tons per day has been built. These works were constructed principally from the waste pile at Bullionville, the refuse of contractors who erected works at that place.

ARIZONA.

Arizona is not as prosperous a mining region as it ought to be. The protracted Indian troubles frightened away Eastern investors and drove miners from the camps. Prospecting ceased in certain portions of the Territory for the same reason. Still these troubles have all ceased and the whole Territory is as peaceful as any part of the Union. There are plenty of good mines, and a number of districts, but unfortunately the people there have no capital, and capital does not come. The leading Tombstone mines, after paying a large amount in dividends, reached water level, requiring expensive pumping machinery, and have since been involved in disputes among themselves regarding the proportion of pumping expenses which each is to bear. There seems to be no immediate prospect of a resumption of work, and meantime Tombstone is not the lively camp it once was. Much was expected from the Quijota mines in Pima county, to which place there was a big rush three years ago. A mile of stores—some of them expensive buildings—were built up in three months, town lots sold as high as \$1000 and a newspaper was started, but the mines have not panned out as was hoped. Other mining ventures met with little better success. In some instances mills were built where there was no mine, in others, the ore gave out at a moderate depth, while frequently, where the mine and mill were both first-class, some cousin of an Eastern stockholder who had learned mining in a stockbroker's office, would be sent to "manage" the enterprise, resulting, of course, in an early discovery that the mine was no good.

Still, as our weekly mining summary shows, a good many men are at work in the various camps and getting along as best they can without the aid of capital. The country is full of mineral. Some of the best copper mines in the Union are in Arizona. The low price of the metal and the advantages of transportation possessed by Michigan and Montana have been disastrous to Arizona's copper interests. The mines are just as good as ever, though, and will be worked with renewed vigor when the price of copper warrants it. The class of ores at Bisbee and thereabout is such as to admit of very cheap and perfect smelting. There are many gold and silver-mining enterprises now under way in the Territory which promise great results. People can buy good claims there now for much less money than in most other mining regions; and when a "boom" sets in the direction of Arizona once more, those who have waited will realize their reward.

The Arizona *Silver Belt* in speaking of the situation in the Territory says: There is much in the situation that is hopeful, and while Arizona has, from obvious reasons, thus far failed to gain that recognition which her great mineral wealth rightly entitles her to, yet there are abundant signs that we are to share with our sister Territories in the approaching prosperity. But while the situation holds much of promise, nevertheless there are features about it—probably inseparable from mining home—that are ominous, namely, the purchase of worthless properties, the stocking of mines far beyond their intrinsic value and incompetent management. These are the causes which in the past hindered the progress of mining and again threaten to check its rise. There is, apparently, a craze on with the public to buy mining stocks of any and every description, not alone by wealthy individuals, but also by people of limited means, who are not content until their savings have gone into mining shares, of the real

value of which they are, in a large majority of cases, entirely ignorant. St. Louis furnishes the most striking example of this mania. Three or four years ago mining men would have as soon thought of looking in the moon for purchasers of their mines as to St. Louis. Now no prospect hole is so insignificant but what a purchaser can be found for it there. There are many legitimate mining projects that have been and others that will, in the near future, be set on foot by men of honest purpose who will carry into mining the same sound and sagacious principles by which they attained success in other pursuits. Such men the West wants; men who look upon mining not as a speculation but as a legitimate business, requiring the same intelligent and common-sense management as is necessary to success in any mercantile pursuit.

But those men who purchase undeveloped claims for a few thousand dollars and float them on an unsuspecting and credulous public for 10 times their cost, are greater criminals than the defaulting bank cashier or the highway robber, and should be so considered in the eyes of the law. There is not one chance in a thousand for the success of such wild projects, as their originators well know, and when failure comes and the stockholders' money is swallowed up, the West must hear the burden and curse and mining be denounced as a rank speculation. These dupes of the fine-haired gentlemen who have lined their own pockets, seldom think of accusing them of dishonesty, but they are, in nearly every instance, responsible for the failure, and who, if justice were meted out, would change their residence from the aristocratic mansion to the penitentiary. We need not go away from home for such examples of failure altogether chargeable to gross incompetency and reckless expenditure. All about us are the mute evidences of failure; partially developed claims abandoned; mills and smelters idle and decaying. Here a company that bought a worthless prospect for \$10,000 and erected a \$100,000 mill; there a mine that is known to be valuable but mismanagement has injured the property, bankrupted the company, disgusted the stockholders; another company with a promising claim, by the advice of an impracticable superintendent, has purchased expensive machinery not adapted for the reduction of their ore. Such cases are part of the history of many districts and of almost all the best camps. Fortunately the repetition of these egregious errors becomes less frequent every year with the growth of mining, the wider dissemination of practical knowledge and the improvement and cheapening of methods for treating ores.

One thing we can reasonably certain of, and that is the early development of Arizona's mineral resources. The Indian question has been permanently settled by the removal of the Chiricahuas from the Territory. Railroads are being built which will open rich mining districts hitherto little known, cheapen the cost of supplies and give an impetus to every kind of business.

COLORADO.

The State of Colorado still leads in bullion product, as the figures given in another column show. The total output for the year was the greatest known. In the old districts, as well as in those which are, comparatively speaking, new, there was increased activity. The output of Gilpin, the great gold producing county, was the greatest it has made for the past 16 years. Leadville awakened to new life and asserted itself in such a way as to convince even the worst of its enemies that their prophecies of evil regarding it were false. In Aspen there was not a great deal of work done, owing to the fact that injunctions had been issued against the working of several of the mines, and also because mine-owners preferred to wait until the arrival of the railroads. But it has been shown beyond any question that the mines of Aspen Mountain are wonderfully rich, and as soon as the shipping of ore is renewed there will be a boom in Aspen such as has not been seen in Colorado since the Gunnison stampede of 1880.

Red Cliff also moved forward as a producer, the wonderful mineral caves in the quartzite having proved to be very rich. In the San Juan, and particularly in the Red Mountain and Silverton districts, there was great activity.

A Leadville special to the *News* says the production of Lake county for 1886 shows a total yield for the year of \$13,750,733, being a gain over last year of \$1,500,000. During the year the Leadville district sent into the marts of the United States 48,488 tons of lead, 8,166,145 ounces of silver, 36,546 ounces of gold, and 138,535 tons of ore. The value of the base hullivan produced was \$7,515,148, and that of ore, etc., \$6,135,585.

The Denver *Tribune-Republican* says: To obtain accurate figures of the hullivan yield of our mines at the close of each year is a matter of impossibility, because the smelters cannot then furnish such statistics in complete form. Clooe estimates have been received from most of the smelters and hullivan-buyers of the State, and aggregate as follows: Silver, \$16,450,921; lead, \$5,123,296; gold, \$5,087,901; copper, \$132,570; making a grand total of \$26,794,688, as the yield of the mines of Colorado for 1886. This is an increase of \$4,294,688 over the figures given by us for 1885, and of \$2,362,080 over the revised figures published by the Director of the Mint in May last. That there should be any increase is a matter of moment, in view of the fact that silver has averaged six cents lower per ounce than in 1885, which represents a loss of \$977,-

184.72. To this loss should be added the almost entire suspension of hullivan shipment from Aspen and the curtailment of ore shipments from the vast treasure vaults of Pitkin county. This would represent another million dollars of loss or nearly two million dollars shrinkage from these two sources. To offset this, however, lead has ruled \$12 higher per ton in 1886, or a gain in value of \$668,256 on the 55,688 tons of lead produced the past year. Lake county has shown an increase in value of product of over \$1,000,000, while Eagle, Summit, Chaffee, Clear Creek, Gilpin and the San Juan counties have also largely augmented their product of the precious metals. The official figures procurable several months hence will, it is believed, not materially differ from those now given by the *Republican*.

The Pueblo Smelter, with 13 stacks, ran the first part of the year with 10 stacks, and the latter part of the year with only four. The Colorado Smelter, at Pueblo, with four stacks, has run pretty fully all the year. The Massachusetts Smelter, also at Pueblo, has been idle since last spring, and did but little during the early part of the year.

The Royal George Smelter, at Canyon City, had its two stacks in blast the most of the year. The copper smelter at Canyon City made but two runs and closed down.

The Golden Smelter, at Golden City, with two stacks, has run pretty constantly all the year.

At Gunnison there are three smelting plants, but the Tomichi Smelter, with two stacks, is the only one which has done any business of account, and it has run fairly constantly since early last summer.

At Rico the Pasadena ran a few months during the year, and Durango's San Juan and New York, with two stacks, has run pretty constantly during the year. The smelter at Aspen made but one short run.

Denver has made more progress in smelting than any other point in the State. The McNair and Bailey establishments closed early in the year. The Argo works have run constantly, though have made no effort to run to their full capacity. Their product was as follows:

Locality.	Gold.	Silver.	Copper.	Total.
Boulder.....	\$ 81,200	\$ 2,950	\$	\$ 112,150
Clear Creek.....	93,000	230,000	14,300	337,300
Gilpin.....	175,000	50,500	25,000	250,500
Gunnison.....	20,200	20,200	20,200	60,600
Hustada.....	1,000	3,200	2,500	6,700
Lake.....	122,000	122,000
Ouray.....	3,400	70,000	1,250	74,650
Park.....	5,000	49,500	500	55,000
Summit.....	145,000	120	145,120	145,120
Saguache.....	50,000	3,000	25,300	78,300
Arizona.....	10,075	4,600	14,675	14,675
California.....	5,000	17,000	700	22,700
Montana.....	53,000	514,000	245,000	812,000
Mexico.....	4,500	50,000	3,000	64,500
Nevada.....	57,000	251,000	6,000	314,000
New Mexico.....	15,000	22,000	4,675	41,675
Utah.....	23,200	122,000	40,500	191,700
Miscellaneous.....	292,000	711,000	55,500	1,061,500
Totals.....	\$827,300	\$2,410,555	\$413,115	\$3,651,000

The Omaha & Grant, with nine stacks, have run almost constantly and produced a total value of \$8,053,143, of which \$3,275,901 was from ore produced outside of the State.

The output of Georgetown, according to the *Courier*, was \$1,200,000 for 1886. That paper says: Sufficient is known to justify the assertion that the eastern end of the county has held its own, and there are grounds for the belief that on the whole the county's production has naturally increased. The figures obtained from the sampling works in Georgetown are reliable. What the buyers of Idaho Springs handled is not known. Another difficulty is to ascertain the amount of ore shipped direct from the mines to Denver and other points. A number of our best-informed men think that \$100,000 would be a low estimate for the amount so shipped from Georgetown. The amount of ore shipped from Lawson is not known, nor is that considerable item, the gold from the placers. Following is the value of ore purchased by the three Georgetown works:

Miners Works.....	3,204 tons	\$923,542 33
Hall & Co.....	3,449,134 lbs.	359,854 00
Public Ore Market.....	3,813 tons	424,738 40

Independent shippers (est.).. \$1,168,134 73

Total value .. \$1,208,134 73

GRANT SMELTER.

The product of the Grant smelter, from Colorado ores only, has been as follows:

Silver.....	2,772,939 ozs.	\$2,745,209 61
Gold.....	57,121 ozs.	1,176,932 60
Lead.....	8,645 tons	39,777 00
Copper.....	300 tons	60,000 00

Total value .. \$4,021,679 21

HOLDEN SMELTER.

The Holden smelter has been in operation but three months, during which time it produced:

Silver.....	335,274 ozs.	\$335,274 00
Gold.....	1,567 ozs.	1,567 00
Lead.....	2,008,401 lbs.	2,008,401 00

Total value .. \$498,432 51

PUEBLO SMELTING WORKS.

The following is a statement of the production of gold, silver, lead and copper turned out in 1886:

Gold.....	18,500 ozs.	\$ 370,000
Silver.....	3,500,000 ozs.	3,500,000 00
Lead.....	19,500,000 lbs.	740 000
Copper.....	100,000 lbs.	10,000 00

Total value .. \$4,620,000

The Denver Mint treated \$1,444,706.29 worth of gold in 1886, \$18,575.31 of which came from Clear Creek county.

The Elk Mountain *Pilot*, of Crested Butte, in collating the shipment of mineral, including the

coal and coke shipments, has taken great pains to get these figures as accurate as possible for the last six years—ever since there has been any shipments from the Elk mountains. Without further comment we will proceed to give the figures of the precious mineral shipment from Crested Butte for the year ending Dec. 31, 1886:

Where From.	No. Tons.	Estimate Value.
Aspen.....	310	\$15,000
Bullion King.....	200	30,000
Forest Queen.....	90	30,000
Baby Chief.....	40	6,000
Metzler concentrator.....	70	25,000
Kneelsor.....	100	20,000
Crested Butte.....	30	1,500
Domingo.....	40	5,000
Augusta.....	70	6,000
Bullion Prince.....	10	400
The Frank Smith.....	20	2,000
Miscellaneous lot.....	80	20,000
Totals.....	1,060	\$195,700

Below we give the figures of the coal and coke shipments from Crested Butte for the year ending December 31, 1886:

Monthly Shipment.	Anthracite. Tons.	Bituminous. Tons.	Coke. Tons.
January.....	1,210	3,180	2,410
February.....	2,580	2,580	2,580
March.....	3,190	2,890	2,890
April.....	3,420	2,890	2,890
May.....	5,200	2,500	2,500
June.....	240	4,530	2,510
July.....	80	4,340	1,440
August.....	570	5,610	2,040
September.....	3,940	5,620	1,800
October.....	4,650	6,070	2,890
November.....	3,540	4,630	4,010
December.....	3,690	5,680	4,180
Totals.....	37,890	54,200	31,850

In Idaho Springs district the *Gazette* gives the following: Through the courtesy of Mr. Ben Allen, manager for Matthews & Webb at this place, we find the following amount of ore was purchased by these works during the year 1886:

Silver, ozs.....	290,705 19-100
Gold, ozs.....	17,682 89-100
Lead, lbs.....	587,102 4-100
Copper, lbs.....	68,020 8-100

Or a total currency valuation of \$673,337.55.

Through the courtesy of Mr. Ralph Chase, manager for Morris, Vincent & Root, we are furnished the following figures: These works have purchased for the year ending December 31, 1886, 2565 tons of ore, which contained the following metals and value:

Silver, 136,825 ozs.....	\$136,825 00
Gold, 1206 ozs.....	30,312 00
Lead, 316,155 lbs.....	12,646 20
Copper, 15,168 lbs.....	1,616 80
Total value.....	\$190,303 00

The *Freeland* swells the grand output for 1886 by: Gold, \$245,555.21; silver, \$49,125.71; copper, \$1490.45; total, \$296,201.37. The *Plutus* comes to the front with the snug little sum for 1886 of: Gold, \$80,331; silver, \$60,163.35; copper, \$5239.53; total, \$145,733.91. There was shipped by railway from Idaho Springs, in 1886, 29,930,048 pounds of ore. Taking it upon the whole, the year 1886 has been a very prosperous one. The production has materially increased over the previous year, and the outlook for 1887 is extremely bright.

IDAHO.

While Idaho has done very well the past year, the prospects are that her hulsion product will be much increased during 1887. In the Wood River region the year has opened full of promise. According to the *Times*, the Minnie Moore, the Queen of the Hills, and other mines in and around Bellevue, never yielded so much as they do at the present time, and never had half as much ore in sight. The Climax, Creasus, Commodore, Wild Irishman, Japan, and other Croy gulch properties, are demonstrated to be mines; and the Nayaug, Snow-Fly, Montana, Red Cloud, and other claims on Deer creek, show fully as much ore. At Bullion the old favorite Mayflower is showing an extensive vein of solid galena, flanked by two or four feet of first-class jiggling ore; the Bay State shows galena, and lots of it; the Durango is being put in shape for a good yield in the spring; the King of the Hills ore body is showing more value with every foot of progress; the Idahoan is richer than ever; the Eureka, having changed hands, will be exploited in the spring, and the Pass and other claims on the divide are showing value. All this will undoubtedly combine to give Bullion a huge boom next summer.

On the east fork of Wood river the North Star is proving extensive and valuable, keeping the concentrator more than supplied with ore. The Triumph group is showing up a large value of concentrating ore, with indications of something much better in the near future, and during next season the Fork will undoubtedly make a creditable showing.

In Parker, or Elkhorn gulch, the Quaker City is showing quite a width of ore going up in the thousands, and other properties justify the prediction that the most prosperous days of the gulch are yet to come.

Boulder Creek, Galena, Vienna and Sawtooth all evince an ability and an almost instant readiness to surpass their former production, and new discoveries are confidently looked for.

Warm Springs creek and the Smoky districts also promise much. The Carrie Leonard, Galore-Stormy, King of the West, Tyrannis, Alma, Providence, Ophir, Silver Star, etc., are showing good ore; and if the yield of that section during 1887 does not exceed \$1,000,000, the *Times* will be much mistaken.

But the section of the Wood River region which promises the most, which justifies the wildest hopes, is, after all, the Gold Belt.

There is where the most of the mine fortunes in this region will be made. The veins are massive, crop out boldly, and can be traced on the surface for miles. The ore, though not altogether free, is sufficiently so to mill fairly and cheaply; and there are vast quantities of it, mountains of it, that only await the construction of mills to yield up their treasure.

In Bayhorse district O. J. Salishury, in an interview with a Salt Lake *Tribune* reporter, states that the Beardsley, Ramsborn and other mines will be extensively worked next spring. A sampling mill has been completed with a capacity of 50 tons a day for the concentration of ores. The motive power has been changed from steam to water, by which means greater pressure and increased power is attained, and can be used at all seasons of the year. At present only development work is being done, and only such ore taken out as is required to be removed. Some 15 or 20 owners of small mines about Bayhorse are at work developing their claims, and will become contributors to the concentrator and smelter.

In closing his review of the mines of the Northwest, Prof. Herbert Lang furnishes the *Oregonian* a large amount of statistical matter, which, in reference to the mines of Idaho, will prove of general interest to our readers. He says:

"We are told that the total production of Idaho's placers for the past 23 years has reached the astounding sum of \$70,000,000. Of this, \$20,000,000 have been taken from the gulches and flats of Idaho City and its vicinity in 18 years. In other words, the localities of Boise Basin, Quartzburg, Idaho City, Placerville, Pioneerville and Banner are supposed to have yielded \$1,000,000 per year for 20 years. Hardly less rich were the renowned camps of Oro Fino, Elk City, Florence, Miller's, Warren's, and the bars of the Clearwater and Salmon. But save as matters of history, these facts have no further interest for humanity, inasmuch as a great part of the sources of this wealth are practically exhausted. There still remain, however, some good but limited and isolated tracts of gravel to which the attention of miners is being gradually directed. Thus, a slight rush of miners took place lately to the head of the Payette, where new discoveries were reported. The importance of the find has not yet been made known. It is extremely probable that the placers of Kootenai county will be found to be extensive. But far there is no precise information concerning them, but a good number of men are said to be making wages on Priest's or Vermillion river, which flows from Lake Kanikso into the Pen d'Oreille. As to the Boise Basin, the best authorities say that it still contains 125,000,000 cubic yards of auriferous gravel, some of which can be made to pay if water can be brought to it."

The Boise City National Bank has prepared the following estimate of the gold, silver and lead production of Idaho during the year 1886. The 10 per cent addition to the total is the estimated value of the gold taken out by Chinese and others of which no account could be obtained:

Counties.	Gold.	Silver.	Lead.	Total.
Ada.....	\$ 5,000	\$ 5,000
Alturas.....	232,500	3,250,000	750,000	4,232,500
Bingham.....	20,000	20,000
Boise.....	665,000	125,000	650,000
Cassia.....	25,000	25,000
Custer.....	137,000	1,000,000	125,000	1,262,000
Idaho.....	600,000	600,000
Lemhi.....	385,000	300,000	690,000	1,385,000
Nex Perce.....	20,000	20,000
Owens.....	25,000	25,000
Gwyhee.....	155,000	57,000	212,000
Shoshone.....	800,000	300,000	100,000	1,000,000
Washington.....	5,000	5,000
Totals.....	\$2,664,500	\$5,032,000	\$1,655,000	\$9,351,500
Add, say 10 per cent.....	935,500
Grand total.....	\$10,287,000

The Cœur d'Alene country is an important part of Idaho's mining region. Samuel B. Pettingill writes as follows concerning it in the *Portland News*:

"The Cœur d'Alene country at present comprises two main districts, which, for convenience, may be designated by the names of the streams which flow through them, as the Pritchard creek district and the South Fork district. These two streams are branches of the Cœur d'Alene river, and flow in substantially a parallel course about 20 miles apart in a westerly direction. A glance at the map will show that the Bitter Root mountains, in which these streams rise, trend to the southeast, while the course of the main river is southwest. The South Fork is consequently a considerably longer and larger stream than Pritchard creek, and the mineral belt through which it flows is also more extensive. These two districts are also distinguished from each other by the mineral which each principally bears, that of Pritchard being mostly gold, that of the South Fork silver and lead. As in the case of most all mining regions, the Cœur d'Alenes were opened, not on quartz, but placer locations."

"The Cœur d'Alene country now contains several large mines of assured value, and the promise of a great many more. It has a substantial basis for business, and is open to the markets and business of the world. Its development is likely to be rapid from this time. I think I hazard nothing in saying that within a year it will have 100 productive mines. Just what it will develop into mine is not for me to say. And no man can do more than to make a good general guess at their value. The field is certainly an inviting one for enterprise and investment, and money and labor expended according to the solid principles of modern mining will tell the story. The coun-

try is especially favored in point of location, climate, water and timber. It is more than half surrounded by the Northern Pacific railroad, which runs within about 25 miles of Murray on the east, and is now connected by rail and steam navigation with the South Fork district. All the freight for Murray during the past year, except the machinery for the Golden King mill, has gone in from Thompson's Falls. But the opening of the railroad up the South Fork will bring the cars nearer to Murray and give the whole region excellent facilities for transportation."

MONTANA.

Montana is making wonderful progress in mining. After working out the famous placers years ago the Territory made little show for a long time. But on the discovery of the great mine of Butte, miners and capitalists were again attracted, and now some of the best mines in the United States are being worked. Butte is, of course, the most prominent mining center, and her mines are now turning out about 4000 tons of copper and silver ore per day. There are seven large mills in operation there, aggregating 310 stamps. The Alice has 80 stamps, Lexington 50, Bluebird 70, Moulton 40, Silver Bow 30, Dexter 15 and miscellaneous 25. The mining population of Butte is greater than that of any other camp in the world, and the prosperity of the town ceases to be a matter of wonder when the amount of money paid out monthly by the mine-owners is considered. Miners' wages are \$3.50 per day, laborers and top-men receiving \$3; lumbermen, engineers and other skilled workmen from \$4 to \$6. Mining company wages will, therefore, average about \$100 per month. The *Inter-Mountain* gives the following list of the number of employees of the leading concerns and the amount of their pay-rolls:

Company.	Men Employed.	Average Pay-roll.
Anaconda Co.....	900	\$ 90,000
Alice Co.....	345	34,500
Lexington Co.....	300	30,000
Moulton Co.....	125	12,500
Bluebird Co.....	250	25,000
Silver Bow Co.....	200	20,000
Colorado Co.....	300	30,000
Parrot Co.....	325	32,500
Montana Co.....	150	15,000
Butte Red. Works.....	50	5,000
Clark's Colusa.....	100	10,000
Mountain View.....	25	2,500
Any Silvermine.....	75	7,500
Mines near Burlington.....	150	15,000
Cora.....	25	2,500
Clear Grit.....	25	2,500
Chambers Syndicate.....	150	15,000
Golden Rule.....	30	3,000
Miscellaneous.....	500	50,000
Totals.....	4,005	\$400,500

The results of the year's work at this famous camp are decidedly encouraging, and show a marked improvement over the previous year. The *Butte Miner* says: The mines never looked more promising, and their output never more satisfactory. Their permanence and value are thoroughly established, and the value of their output for a series of years hence can be estimated with mathematical accuracy.

Notwithstanding the long shut-down of the Anaconda mine and smelter, and the brakesmen's strike at the depot, both of which largely subtracted from the freight shipments and receipts for the year, the former ran up to nearly 240,000 tons, and the latter increased from 113,060 tons for 1885 to 151,029 tons for 1886. Bullion shipments through the Pacific Express office in this city have increased from \$6,000,000 for 1885 to \$6,646,934 for the past year. The grand total output for the year is not far from \$20,000,000, exceeding the gold shipments of California for the same period of time.

Solid, substantial improvements have been made in mining facilities during the year which will largely swell the output of the district for 1887. The Burlington mill with its 70 stamps and the Butte Reduction Works are among the most prominent of these. Prospects have been developed into mines of assured value, and large bodies of ore have been opened in well-known mining properties. All the leading mines show no diminution in quantity or quality of output, and prices for contiguous properties are tending to points somewhere in the neighborhood of their real value. The outlook of the mining interest was never more flattering."

The *Butte Inter-Mountain* published a New Year's edition which for typographical appearance and make-up excelled anything we have seen of the kind. It contains a vast amount of information about Butte, and from it we condense such facts as are of general interest to non-residents. Very few of the mining properties now being profitably worked in Montana are incorporated, and still fewer are on the board; yet those that have been listed have made a proud record of dividend-payers and justly take rank among the leading properties of the country. Following is the list of Montana properties now on the board and their dividends to date:

Alice.....	\$ 775,000
Amy & Silversmith.....	235,000
Boston & Montana.....	520,000
Elkhorn.....	150,000
Granite Mountain.....	1,700,000
Hope.....	158,241
Lexington.....	665,000
Drummond.....	705,000
Hecla Con.....	1,047,500
Helena Mfg. & R. Co.....	102,000
Moulton.....	320,000
Original.....	117,000
Totals.....	\$4,753,741

These are eloquent figures, especially so in view of the fact that four-fifths of the above dividends have been earned and declared with-

in the past 18 months; but still the sum represents but a fractional part of the profit made from the development of Montana mining properties, and but a tithe of the gross output. Some of the mines of the Territory are owned by private individuals, and many others which are incorporated are not listed on the stock boards and their earnings are, therefore, not made public. Among them are the Cable and Pyrenees gold mines, the Anaconda, Parrot and many other copper mines, and the Bluebird, Colorado and Silver Bow companies, silver mines, and hundreds of others which could be mentioned. But we submit that no State or Territory of the Union contains 12 incorporated properties whose average net profits are as great as those of the above-named companies.

In the work of chloridizing the silver in the ore preparatory to its amalgamation, the quartz mills of Butte consume annually many thousand tons of salt, the chlorine gas effecting a chemical change in the silver by the liberation of the bases. The amount of salt required varies with the percentage of bases. The Lexington uses daily 10 tons, the Alice 10, the Moulton six, the Bluebird seven, the Silver Bow four, and the other mills combined about five. Thus every day there are about 42 tons of salt used in Butte, or about 15,000 tons per year, upon which the original cost is about \$2.50 and the freight \$15 from Ogden.

In the year 1886 Butte successfully passed through two great crises, viz.: the decline in copper to \$35 for Chili bars on the London market and the drop in silver to 91 cents per ounce in this country. Each while it lasted was regarded as a grave menace to the very existence of the camp, but now that prices have somewhat recovered, it appears that the depreciation has served a useful purpose, in that it indicated to what extent the copper and silver mines of Butte are capable of competing in the metal markets of the world with rival producers both at home and abroad. The Calumet and Hecla temporarily broke the market, but it could not withstand the strain of reduced prices; and when it became apparent that its famous "cut" of last spring affected its own interests more injuriously than those of the Montana producers which it aimed to drive out of the market, the Lake sharps were glad to retreat to the safe ground of honest competition, and the home market under a growing demand became firm at home prices, while foreign quotations were sensibly affected and took an appreciable rise which they have since maintained.

Upon the subject of silver and the warfare which the national bankers, Wall-street speculators, and the present administration have incessantly and dishonestly waged against it in opposition to the best interests of the country and in particular antagonism to the West and South, it is not the purpose of this article to enlarge. It is enough to call attention to the fact that the white metal has asserted itself, and despite the puny efforts of the stock gamblers and gold bugs in America and the continued refusal of England and Germany to restore its monetary value in those countries, its market value has not been destroyed, and the depreciation which it suffered from the sudden and precocious onslaught of its enemies proved of but temporary duration.

And while all these splendid enterprises are justified on cold business principles, and will reach an early consummation, the old stand-by will show no signs of weakness, and with improved methods and appliances will increase their benefactions to the world. The Alice, Moulton, Lexington, Silver Bow and Dexter mills, and the smelters of the Montana, Colorado, Parrot and Butte Reduction companies go merrily along on the even and profitable tenor of their way, producing fine bullion and copper matte and pigs to the extent of their capacity, distributing benefits to all classes of the community and giving employment to thousands of happy and frugal workmen.

From official sources, when obtainable, and from other sources equally reliable, the following record of the precious and base metal production of Butte for the year 1886 is made up by the *Inter-Mountain*:

Fine bullion, per express.....	\$5,856,500
Copper, 55,000,000 lbs. at 10c.....	5,500,000
Silver ore shipments.....	650,000
Silver in matte.....	1,240,000
Totals.....	\$13,246,500

In round figures the output in other parts of the Territory may be safely estimated at \$10,000,000 in gold, silver and lead, making a grand total of \$23,246,500.

At the town of Marysville, in Lewia and Clarke county, and about 60 miles northeast of Butte, is located the famous Drummond mine, the remarkable history of which is now so familiar to the mining world. The property is stocked for \$3,300,000, divided into 330,000 shares, having a par value of \$10, though its market value is now \$48 per share. The plant consists of three mills, containing severally 60, 50 and 10 stamps. During the past year an average of about 3000 tons of ore per month has been treated, which amount has lately been increased to 6000 by the completion of the new 60-stamp mill, which started into operation in the latter part of November. The dividend record of the Drummond for the year 1886 up to October 15th, was \$795,000, which will probably be increased to \$1,000,000 by the profits during the remainder of the year. Hereafter the dividends will be larger than before, as they will be increased by the profits of the low-grade ore which the new mill was specially designed to treat, and which previously

was not reduced. For the half year ended June 30th, the gross output of the mine with only a 50 and 10 stamp mill in operation aggregated \$700,500, from which, after deducting the current expenses during that time, there was left to be applied to the net profit account, \$439,660. The record for October is a fair sample of the year's work. In that month 3130 tons of ore were crushed by 60 stamps, the total yield being \$137,400. The regular working expenses were \$41,000. The development of the mine is now confined to the sinking of a big winze from the 400-foot level with the view of opening new ground to the depth of 600 feet, the design being to keep the mine always two years at least ahead of the mills.

The famous Granite Mountain mine, four miles from Phillipsburg, is yielding largely.

The Hope, near Phillipsburg, had its mill running last year 244 days, crushing 65723 tons of ore, producing 99 bars of bullion, the Government assay of which was 113,647.94 ounces of fine silver, equal to 17.30 ounces per ton, producing in hand \$112,261.38. The expenses of the mill were \$26,216.74, equaling \$4 per ton on the quantity of ore reduced.

The Moulton company has been a steady shipper of fine bullion, one-half of which during the year has been from custom ore and one-half from the mine. The value of the bullion yield for the year is \$625,000.

The total copper product of the Parrot company for the past year is estimated at 14,000,000 pounds, which, though it does not represent the capacity of the works, is upward of 1,000,000 pounds more than the output of 1886. At ten cents per pound, the average price of copper for this year, the value of the output is \$1,400,000.

The Anaconda mine belongs mainly to J. B. Haggin, of San Francisco. The town of Anaconda, with its 4000 inhabitants, which is the child of the Anaconda company, affords proof enough of the magnitude of the enterprise and of the determination of Mr. Haggin to manage it on a broad and liberal scale. The Anaconda mine, with its 1000-foot shaft and miles of drifts and crosscuts, opens up an ore body whose average width of 50 feet for a length of 3000 feet we believe to be the most phenomenal copper property on the globe. That a concentrating and smelting plant, with all the appliances needed to treat the output of such a mighty producer, should have been erected at Anaconda at a cost of \$2,000,000, may excite admiration by the stupendous proportions of the work; but after all, it is but a logical business sequence of the mine development. The plant is now treating 1000 tons of ore per day and producing 100 tons of copper matte, and there is no reason why this supply should not continue for half a century. On the payrolls of the company are 1200 men, and directly and indirectly it contributes to the support of 5000 people in the counties of Silver Bow and Deer Lodge. These are eloquent figures, and they tell more of enterprise, nerve and brains than pages of detail could convey. An experience of two years has shown the management the secret of successful copper manufacture to lie in organization, in economy, in constant watchfulness, in the utilization of natural forces, as far as possible, and in the practical application of scientific principles. This lesson has been well learned, and now, after a period of several months, during which the smelter did not run, the company is equipped with every facility to enter the field of American and foreign competition. As a mining proposition, the Anaconda, with its allied claims, is the greatest on the earth to-day, and it is backed with better mines and more money than any other.

To Mr. Spruille Braden, manager of the Government assay office at Helena, the *Inter-Mountain* is indebted for the following statement of the business transacted by that institution for the year ending December, 1886:

VALUE GOLD AND SILVER.		
Month.	Value Gold.	Value Silver.
January.....	\$ 18,727.73	\$ 206.07
February.....	25,298.97	327.33
March.....	14,876.62	146.80
April.....	45,945.92	1,160.94
May.....	111,551.61	36,650.63
June.....	170,428.56	40,405.65
July.....	161,672.23	36,652.11
August.....	182,612.29	24,642.53
September.....	155,637.06	20,490.24
October.....	173,656.55	3,766.39
November.....	165,990.17	3,054.01
December (approx.)	93,141.61	1,744.14
Totals.....	\$1,356,547.61	\$169,250.14
Total value gold and silver, \$1,525,797.75.		

NEW MEXICO.

New Mexico is slowly coming forward into more notice as a mining region. The great drawback is lack of sufficient capital to conduct operations properly. Within the Territory are many good mines that would pay capitalists handsomely if they would only take hold of them. The miners there, however, are working away hopefully, knowing that in process of time the money must come where there are good mines.

In the Black Range region mining operations are comparatively quiet, but at the same time very encouraging. Considerable work is being done on the quiet; many mine-owners are getting their properties in shape so as to be ready for the mill when it starts up. The lixiviation works once in operation there will be a vast change in the mining industry of the northern portion of the Black Range which has an abundance of precious metal within true fissure veins, denoting the fact that there is untold wealth for those who seek it.

In Sierra county the output of the Hermosa

camp for the year past is something over \$50,000. At Hillsboro the 10-stamp mill is running full head on the ores of the Snake and Bohtail gold ores, owned by Chapman & Thompson, and has no time to give to customers.

At Georgetown, Grant county, are the Naiad Queen, Commercial, and many other mines at work. There is also a large iron mine there known as the Ironhead.

The Sierra Grande mines, at Lake Valley, are leased to practical miners on the following terms: Twenty-five per cent on less than 1000 ozs. per month; 30 per cent on less than 2000 and over 1000; 35 per cent on less than 3000 and over 2000; 40 per cent on less than 4000 and over 3000; 45 per cent on less than 5000 and over 4000; 50 per cent on all over 5000 ounces per month. The Sierra Grande property is in the list of dividend-paying mines.

The new county of Sierra, says a correspondent of the *Socorro Bulletin*, is a little southwest of the territorial center. It is compact, with a breadth of about 50 miles from east to west, and a length of about 60 miles from north to south. It lays claim to being the richest in mineral wealth of any county in New Mexico, and embraces within its boundaries Lake Valley, Hillsborough, Kingston, Hermosa, Chloride and other camps where rich mineral has been found.

Lake Valley, the terminus of the branch of the Atchison, Topeka & Santa Fe Railroad extending in this direction, has for years been the seat of extensive mining operations, and laid claim to being the richest mining camp in the West. Millions of dollars have been taken out of her mines, and she will yet yield untold millions when the problem has been solved of treating profitably her lower grade ores; especially so since the mines can now work without danger from depredations of Apaches who for so many long years were a source of constant menace to the miner and settler. True, the rich mineral deposits known to exist at Kingston, and on the South, Middle, and North Perchas, and in the same belt away to the north at Hermosa and beyond, were enough to lure many adventurous spirits in quest of fortunes to those promising El Dorado; but danger from the Indians prevented any development of note, except in the immediate vicinity of Kingston, and there only to a limited extent. But since the Indian question has been settled, within a year past, Kingston has sprung rapidly to the front, until now Lake Valley has to yield the palm to her.

Among the Kingston mines are the Illinois, Brush-heap, Lochiel, Iron King, Superior, Bullion, Lady Franklin, Black Colt, Comstock, Kangaroo, Deadwood, Butte, Miner's Dream, Miner's Delight, etc. The sampling works at Kingston employ 20 wagons constantly delivering ore at Lake Valley.

The mineral and bullion product of Socorro county we will give in a future number.

The newest excitement in New Mexico is the Gold Camp, a recent discovery, which has been fully described already in the *PRESS*. Lack of space prevents our giving as extended a notice of this Territory as was our intention.

OREGON.

The main interest in Oregon mines last year centered in the Pine Creek mines, though it cannot be said the camp came up to expectations. Capital is needed there as elsewhere, but it is now claimed Eastern capitalists are going to take hold of the mines. New wagon-roads have been constructed to the mines, through State aid, and outside capital has taken hold with some degree of vigor. The mines have been found to improve as depth was reached, although the character of the ore changed from free milling to sulphurets, but grew richer. Many difficulties have been overcome and the outlook for Pine Creek is now more promising than at any time since the discovery of the mines.

In Baker county there are eight organized mining districts, which are more or less productive, and several more will probably be organized this coming spring. Prospectors have been successful in finding new ledges as a result of their summer's work, and capital will be induced to develop them. There are many placer diggings as well as quartz mines, and the county affords a good field for miners and capitalists.

The gold-bearing districts of Oregon are, in most part, the continuation north of the great talcosa slate zones of California, with all their accompanying dykes of granites, porphyries, greenstones or diorites, and extending north and northeast until they disappear under the great basaltic overflow of the Columbia river basin. They spread broadly out east and west (with alternations of basaltic lava) from the Coast Range, in Josephine and Curry counties, to the Snake river along the eastern border of Baker and Union counties.

Wherever these metamorphic slates are found in the southern counties, gold has been found in the streams, and more or less gold bearing quartz, either as "float" or in veins, has also been discovered. Large areas, even of these southern and eastern counties, have been covered by the lava overflows, and it is useless to prospect in such localities; but wherever the slates, granites, porphyries and greenstones appear there is a reasonable hope or chance to find gold and silver mines.

Portland now has reduction works, and judging from what the *News* thinks, there will be more of them in time. That paper says: From Southern Oregon clear across the mountains to Pine creek and the mineral fields of Baker county; from the old and tried treasure-

vanits of Owyhee, Wood river and Salmon river, to Colville and Okanogan; from the forest-clad hills of Cœur d'Alene to the silver ledges of Butte and other prosperous districts in Montana, the mines have been yielding up their stores of hidden wealth, and new regions are constantly opened up before the intrepid prospector. Within the past year millions of dollars have been added to the wealth of the world from the mines of the Northwest.

The mineral fields naturally tributary to Portland (and that includes the entire Northwest) are, comparatively speaking, but a stone's throw from railroad transportation, and are easily accessible for all sorts of supplies. If any reliance is to be placed on indications, geological formations and the opinions of trustworthy experts, there is sufficient in the mountain ranges of Oregon and the Northwest generally to eclipse the output of Nevada in the palmiest days of the Comstock. Reports from all the leading mining districts of the Northwest clearly indicate the activity that now exists in this mining industry, and show the opportunities now within reach to make Portland the greatest mining center in the country. They show what these mines are now doing toward the development of the country.

In Douglas county are a number of mines. They have of nickel ores three varieties; non-mete, garnierite and nickelerous-phyrotite. Of iron ores, five varieties; manganiferous, magnetic, limonite, hematite and chromite. Of quicksilver, two varieties; cinnabar and metacinnabarite. Of copper, four varieties; native copper, chalcopyrite, copper glance and blue and green carbonates, the latter, however, only as incrustations. Gold occurs native in quartz. Silver is found in placer washing as electrum, a native alloy with gold, and is also found associated with gold in some of the quartz. Very little prospecting has been done in that portion bounded by the Cascades on the east, the Coast Range on the west; the Calapooia mountains on the north and the Siskiyou on the south, embracing the counties of Douglas, Jackson and Josephine.

UTAH.

In the realm of Utah's great industry, mining, the work of the year 1886 was in some respects more satisfactory than in any former year. While the product of the great Horn Silver has been shut off, the full sum has been more than fully made up by increased product from numerous old and some new mines. With the vitalizing influence which comes of gold and silver mining, because of its product, labor has been promptly and abundantly rewarded, and a market has been made for all the products of field and garden.

The mines in the vicinity of Park City have furnished from one fifth to one-fourth, possibly more, of the ore and bullion production of the entire country. The *Record* says: Park City is the mining camp of the Territory, and Uintah, Blue Ledge and Snake Creek are the leading mining districts—all others follow. With pride we always refer to the Ontario as a model mine. It is to Park City and the Territory what the old Comstock was to Virginia City and Nevada. With few exceptions it has paid more profits, and has more ore in sight; it is operated economically and honestly and is a marvel of the mining industry. The Ontario has produced over \$17,000,000 and has paid nearly \$3,000,000 in dividends. The Daly is in the front ranks and will prove to be a second Ontario. The Crescent, Sampson and Apex are making fair records as ore-producers, and we expect before another year roll around to announce ore shipments from the Anchor, Morgan, Jupiter, and, in fact, from a score of a rich but comparatively undeveloped properties which will be opened up within another year.

We condense from the *Record's* review the following concerning Park City mines: Operations on the Ontario Silver Mining Co.'s ground the past year have been on the usual large scale, and the results show most satisfactorily. The work of uncovering the ledges and taking ore from the immense ore-bearing bodies goes on with regularity. About 300 men are employed in and about the three principal workings of the mine. Through the kindness of Superintendent R. C. Chambers we are enabled to give our readers a few figures: The bullion sales for the year to date have amounted to \$1,011,178.49, and the sales of ore were \$642,515.89—a total production of \$1,653,694.38. The Ontario has lately spent \$60,000 in permanent improvements; \$900,000 in dividends were declared in '86, and three years' dividends are said to be in sight.

During the 12 months just ended the Daly's bullion sales amounted to \$522,270.06, and the ore sales for the same period were \$215,855.53; total production, \$738,125.59.

From the Crescent during the year ending last October, 6320 cars of shipping ore and 29,265 cars of concentrating ore, averaging three tons to the car, were sent down the tramway. The ore sales for the same period amounted to over \$187,000, and early last summer dividend No. 6, of \$30,000, or five cents a share, was paid.

The Ontario and Daly mills are running to their fullest capacities and good results are forthcoming. The Crescent concentrator will be closed until next spring. The Mackintosh handles all or nearly all the shipping ore produced in the Park, last year's being nearly 15,000 tons. The sampler is doing good service, and the Wall rolls do better work than the old coffee mill. The product of the mines (and the mills) of Park City for the 12 months

of 1886 has reached nearly \$3,000,000. Where is the district that has done better?

The following is the statement of ore received and shipped by the Mackintosh sampler for the year ended Dec. 3, 1886:

	Pounds.
Ontario.....	21,605,700
Daly.....	6,603,680
Sampson.....	1,506,770
Hayt Bros.....	60,650
Apex.....	53,850
Jupiter.....	38,920
Woodside.....	24,850
Creole.....	15,230
Total pounds.....	29,912,690

The value of the shipments will probably reach nearly \$1,000,000.

The Salt Lake *Tribune* issued a double-sheet number recently, reviewing the year's business of the Territory. From the facts there stated we collate the following information concerning the mines: The past year the silver sandstone district, of Silver Reef, turned out 393,621 ounces of silver, of which the Stormont Company sent out bullion to the value of \$140,880.87, the Christy Company about \$213,000 worth, while the leaching works of the old Leeds mill added in the shape of sulphides of silver about \$40,000. It was only last July that the leaching process at the Leeds mill became a success in saving silver, and that was after a long series of experiments and an entire remodeling of the mill. The mines belonging to the Stormont and Christy Companies look well and have large ore reserves from which to draw. The other mines about Silver Reef are lying dormant, among which is the old Barbee & Walker, reputed to be an excellent property, now in the hands of Wells, Fargo & Co.

Last year 750 tons of salt were mined in San Pete county and 700 tons were shipped from Salina. About 23,000 tons, worth \$100,000, was collected from the Great Salt Lake, most of it being shipped to the silver mills of Utah, Idaho, Colorado and Montana.

The D. & R. G. W. report 237,680 pounds of ore shipped from Wasatch station to the smelters. This means that the company carried that amount of Little Cottonwood ore, but it does not include the entire output of the mines about Alta. In the Emma good progress was made in driving crosscuts, and there is a promise of large ore shipments next season.

The old reliable camp of Bingham, which the past has produced over \$22,000,000, has look of prosperity and activity now which pleases. The railway weights show that over 37,000,000 pounds of ore was sent from Bingham station during the year just closed. As great a haul as this is, it is not all of the output of that camp, there having been nearly as much more sent by teams from the Brooklyn, Yosemite and other properties in that neighborhood, bringing the total output for the year up to over 30,000 tons.

From Stockton district never before has the railroad carried so much ore to market. The smelter was started up and made a short experimental run. The Honerine Company shipped about 1800 tons of ore and concentrates, and they promise to more than double this in 1887. The Silver King, owned by a St. Louis company, shipped about 1800 tons of ore, worth \$25 per ton. The Calumet and Hecla, belonging to the same company, shipped about 1000 tons of ore which marketed about \$50, on an average, and they did large development work on the property. The Catherine, belonging to a Chicago company, sent out about 1000 tons of ore, which averaged about \$50 per ton, and they have since been doing large development work, which will be carried on till spring.

The Argent was worked on a lease, and shipped about 500 tons of \$50 ore. It looks well and promises to be a large shipper this year.

The chief operations on the Ophir side were with the Consolidated Mining Company, owning the Buckhorn, Eighth of January, Monument, Mountain Glen, Antelope, Gray Rock, Battle Axe, Tomahawk and General Sherman. The output for the year was about 2500 tons of carbonate and galena ore, running from 15 to 30 per cent lead and 9 to 20 ounces silver, with a little gold, also. Take the entire district, including Stockton, Dry Canyon and Ophir, and there are such signs of new life as must make the district come to the front as a large ore-producer, and that not far in the future. The Honerine company, with its mill and various mines, paid seven dividends during the year, aggregating \$87,000, and there is a promise of doing much better in 1887.

The past year has been one of progress with the Tintic District. While the Eureka Hill and Bullion-Beck properties have been somewhat prescribed in their operations by being tied up in the courts, their output was large, the former having shipped over 9000 tons of ore, while the Bullion-Beck sent out about 5500 tons, and is now shipping 50 tons of high-grade ore per day. New machinery has also been added. On the Bullion-Beck there have been grand improvements since the property was taken in charge by Capt. H. H. Day, a year ago. The Eureka Hill Mining company added much new machinery during the past year. The company is doing well in every respect, and being regular in its ore shipments, is destined to continue its prosperity indefinitely. The equipment of the mine now is all that will be required for years.

The Mammoth Co. comes next in the ore product of the year, having sent out 2545 tons of ore, beside producing 86,328 pounds of matte at their Tintic furnaces. The Mammoth is to be pushed in its development and will continue to employ a large force.

Considerable work was done on the Copperopolis during the year. The iron mines sent out over 12,000 tons of ore for use in the smelters in fluxing ores. Those mines are regular in their output to just the extent of the demand for iron ore at our local smelters, and for what may be wanted elsewhere. There was no outside demand the past year as in former years.

The Tintic Mining & Milling Co. did well during the year. The mill at Homansville turned out bars of bullion to the amount of 17,000 ounces of silver, and 160 ounces of gold, from the 750 tons ore milled, while they shipped 643,100 pounds of ore assaying about 55 ounces of silver and \$20 in gold.

From a table in the *Tribune* we take the following as showing the ore shipments from Tintic district, in pounds: Eureka Hill, 18,056,020 pounds; Bullion and Back, 10,835,010; Mammoth, 5,190,570; Northern Spy, 671,100; Gemini group, 1,313,430; Iron ore, 24,072,520; Centennial and Eureka, 77,300; Park, 97,720; Swansea, \$5,370; Showers Cons., \$7,460; Hungarian, \$5,700; Jos Daly, 22,450; Silver Coin, 54,480; Martha Washington, 108,550; Tesora, 50,250; Scotia, 20,000; Silver Bow, 10,790; Brooklyn, 10,500; Mono, 20,250; Showers Ex., 142,630; Susan, 28,560; North Star, 6100; Old Chief, 24,000; Diamond King, 10,300; Mitchells, 2250; Lancaster, 4450; King, 7900; Yankee Blade, 10,200; total, 61,084,410.

Besides these shipments of ore, the Northern Spy milled 750 tons at their Homansville mill, and the Mammoth made an experimental run of their smelter and turned out 86,328 pounds of matte. Bringing down to smaller figures, we have a product of the iron mines of 12,036 tons, and 18,505 tons and 1890 pounds of silver and copper ore shipments, to which should be added 100 tons of Mammoth ore smelted and 750 tons of Northern Spy worked, bringing the total product of silver and copper ore up to 19,356 tons, making a grand total of 31,392 tons. The Eureka Hill Mining Company marketed 9028 tons of ore, of which 3072 tons were reduced in the smelters of Utah, and the balance, 5956 tons, was shipped to Colorado.

Outside of the Horn Silver there was shipped from Frisco, ore, concentrates, and matte to the amount of 1,662,534 pounds. The carbonate dump and the tailings pile are being concentrated by some leasers. At first an experiment was made in leaching, without success, and a change was made to concentrating. Operations did not begin until late in the season, since which they shipped 211,814 pounds concentrates. J. S. Jenkins worked over different dumps from which he sent out 499,150 pounds of ore.

Utah's metal product for 1886 is given in tabular form on page 67 of this number of the *PRESS*.

WASHINGTON.

Washington Territory does not produce much gold and silver. Extensive galena ledges have been found and are to be opened. The main mineral resource of the Territory is in its coal mines. Thousands of tons of coal are mined there annually and shipped away. Much of it finds its way to this city. Statistics of the coal production of Washington are not yet available, and its precious metal product was given in another column.

The Debris Question in the Legislature.

On Wednesday last the Assembly made a special order of the bill introduced by Mr. Ohlseyer, of Sutter county, and discussed it. In the *PRESS* of Jan. 15th this bill was summarized, and we here append it in full. It is ostensibly to "protect navigable streams," and is as follows:

SECTION 1. Every person who, by the use of water under hydraulic pressure, shall place, deposit, dump, discharge or wash, or in any manner assist in placing, depositing, dumping, discharging or washing, any tailings, boulders, cobbles, stones, gravel, sand, clay, earth, debris or refuse matter into any navigable stream, or into any fork, branch, affluent or tributary of any navigable stream, or into any place or situation on shore where the same shall be liable to be washed into navigable streams, or into any fork, branch, affluent or tributary thereof, either by storm or floods or otherwise; and every person who shall suffer or allow any other person to use any water supply, in whole or in part owned or controlled by him for any of the purposes aforesaid, is guilty of felony, and is punishable by a fine of not less than \$100 nor more than \$1000, or by imprisonment in the State Prison for not more than one year, or by both such fine and imprisonment.

SEC. 2. The jurisdiction of a violation of any provision of this Act is in any county, first, in which any act is done toward the commission of the offense, or second, into, out of, through, or along which the navigable streams flow which—or any fork, branch, affluent or tributary of which—is affected by the commission of such offense.

It is not believed that the time has come when such a bill can come anywhere near receiving the sanction of the Legislature when fairly considered and the interest of both sides duly weighed. The spirit of the bill is shown by the discussion and the opinions of some of the representative men of the various counties of the State.

When the measure was called up Brusie (R.), of Amador, moved that the enacting clause be stricken out.

Variel (R.), of Plumas, arose and made a spirited attack on the bill. He said: "This bill

applies to many different kinds of mines. Why, in drift mines tunnels are run in under a mass of rock and the pay gravel extracted, which is washed from a reservoir by hydraulic pressure. Now, there isn't a drift mine in the State that will not come under this law. If one cubic inch of gravel is washed by this means into any small stream, the miners will be declared felons. The Anti-Debris Association of Yuba has come here through its agent and is putting in this bill. It operates against the miners on the Trinity and Klamath rivers as well as the Feather and Sacramento. It is aimed at every man who dumps even a wheel-barrow load of mining gravel into a river. It is iniquitous. It stops a vast interest uselessly. I am not here as the paid servant of a corporation or association, but simply as the representative of my constituents. If I should fail to raise my voice in their defense, I should be recreant in my duty. There was a time when the miners sat in honor on this floor. To-day there are men within the sound of my voice who hold the memories of 35 years of California history. I appeal to them to bear me in the name of those who made our Constitution and framed our laws, and see to it that the miner in his old age is not turned out of his only means of livelihood and die of starvation."

Campbell (R.), of Del Norte and Siskiyou, said that such a bill as this would nearly ruin three counties which depended on hydraulic and placer mines, and mining had been nearly stopped there already, and this bill was like kicking a fallen man. There was no need of any such law as this. It was better far to have a commission of competent engineers appointed to investigate this important question and provide a remedy.

Hart (D.), of Colusa, said he was in favor of the bill, if it could be modified. His county contributed \$2000 a year to prevent hydraulic mining. He knew that the laws prohibited hydraulic mining, but, nevertheless, such a bill was needed.

Shanahan (D.), of Shasta, said that this bill was meant to punish the guilty and yet it really punished thousands of innocent people. The bill would confine to the State Prison two-thirds of the county of Trinity. The mining ditches in the northern counties were used to irrigate thousands of small farms as well as providing water for the mines. This bill subverted no good purpose in God's world, and should not prevail.

Remson (D.), of Monterey, said: "To hear some of the opposers of this bill talk, one would think we were living in the days of '49. It is true that the miners have done much for the State, but who has built up the interest of our State for 20 years? I am not in favor of the full bill, but its principle is right. The hydraulic miners have a right to work their mines. We do not pretend to stop them, but we do insist that they shall not injure farmers in following their pursuits. I am not in favor of every measure in this bill, but I believe that it should have full discussion. It is more beneficial to the interests of California than the small farmers should not have their homes swept away than that the miners should be protected in their obnoxious customs. Enough sympathy has been wasted on the miners. It is time to give the farmers a chance."

Brusie said: "I shall not embellish my remarks with eloquence; but I stand up to speak in the defense of justice, and this discussion will draw the lines between the conservative

man and the 'cincher.' I am astonished at the greed and malice some of the members in this house exhibit. The severity of this bill adds insult to injury. Have we miners maintained that we wished to exercise our rights of property to the injury of others? We have submitted to the decrees of the courts, and yet they now come to humiliate us. I can quote from Mr. Catlin's speech on this question—one of the ablest ever given in defense of the miners. He shows that only 1000 acres were damaged in the Sacramento valley—one acre out of every 125 was all the ratio that could be shown and some little rancher who raised hop-poles and tomatoes wanted to stop one of the chief industries of this State. Some of you want to withdraw this bill and modify it. Don't do it. You can't palliate an attempt to murder. Stand by your hill and take the consequences. In Amador county, where I live, there are many farmers, but they let the miners in the mountains live."

Taylor (R.), of Sacramento, thought that it was natural that he should speak in favor of a bill which protected his own city. He felt that the bill was too severe, but at least its spirit should be carried out.

Young (D.), of San Joaquin, hoped that this bill would come before the House. He represented a county that wanted it very badly, and the city of Stockton was anxious for it. The river there was filling up year after year and navigation was paralyzed.

Brierly (R.), of Los Angeles, said that while he thought hydraulic mining ought to be stopped, yet he considered the bill far too severe. The present laws were sufficient. One might as well include the city of Sacramento in the scope of this, because it had built so high a levee and changed the channel of the American so that it overwhelmed the farmers on the other side of the river.

Granger (D.), of Butte, said that he felt it due to his constituents to classify this bill as a dangerous innovation upon the customs and usages of this country. A strict analysis of all the features of this bill would show the members its dangerous qualities. Such legislation should not be brought into the House. It was an unjust measure. In his county \$2,000,000 in property had been shut off. The Anti-Debris Association was attempting to make that a crime which was not a crime.

THE GOLDEN STATE ROCK CRUSHER.

A Combined Rock Breaker and Fine Ore Crusher.

Awarded Grand Medal at Mechanics' Fair, 1886, for Best Rock Breaker and Granulator.

In this machine both jaws oscillate the face of one being concave and the other convex. It develops a new motion, and the movements of the jaw, are complex, differing in different points of contact with the substance being worked, from the time it is placed in the top until thrown out at the bottom. The wearing parts are removable.

A Large Part of the Ore is Finely Pulverized.

Very little wear and tear. About 50 per cent of the ore is finely pulverized. The machine takes less power to run it than any other of same capacity. Great uniformity in size of product.

For particulars, address
S. B. PAIGE & CO.,
General Agents,
116 Front St., San Francisco.

DELINQUENT SALE NOTICE.

Golconda Mining Company—Location of principal place of business, San Francisco, California.
Location of works, Calico Mining District, San Bernardino County, California.

NOTICE.—There is delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 22d day of December, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 262 Market St., S. F.

FOR WEEK ENDING JANUARY 13, 1887.

- 356,102.—HAME TUG—S. B. Davis, Eureka, Cal.
 356,312.—WHEEL FOR SLIVERING JUTE—H. P. Garland, San Quentin, Cal.
 356,282.—ELECTRIC ARC LAMP—A. Harding, Oakland, Cal.
 356,317.—SLIDING GATE—James & Lazenby, Compton, Cal.
 356,284.—REVOLVING PLOW—A. F. La Shells, Biggs, Cal.
 356,285.—SHIELD FOR BOILER FURNACES—Wm. Madden, S. F.
 356,287.—ORE FURNACE—T. McGinnis, Anaconda, M. T.
 356,295.—WINDMILL REGULATOR—H. R. Stephens, Soledad, Cal.
 356,180.—BUTTER WRAPPER—S. Tilton, San Geronimo, Cal.

Mark.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REVERSIBLE WINDOW SASH.—Philip Adelson and Louis Proll, S. F. No. 355,905. Dated Jan. 11, 1887. The invention relates to improvements in that class of window sashes which are journaled so as to turn or pivot upon their horizontal journals for the purpose of reversing the sash, so that access may be had to the glass on either side. The window sashes are pivoted or journaled midway of their length to shoes, so that they may turn about their journals to any desired position, and they have also a spring or other looking bolt at the top by which they are connected with the shoes when turned in a vertical position. In combination with this device is a sliding adjustable strip for the lower sash and a stationary strip for the upper sash to keep out the dust and wind.

TELEPHONE TRANSMITTER.—J. C. H. Stut, S. F. No. 355,952. Dated Jan. 11, 1887. This invention relates to certain improvements in telephones, and its object is to construct a transmitting-telephone, which will produce a larger volume of sound heretofore available by giving a larger variation to the intensity of current in both the primary and secondary circuits, so that conversation may be carried on over a greater distance of line-wire and better overcoming the extraneous inductions, leaks and resistances. It consists of a diaphragm of large diameter, with means for regulating the radial tension and making a softer and more melodious tone, unstable contact points, and multiple variable-resistance contact, adjustable poles in connection with the induction coils, and a means for adjusting the contacts for different distances over which communication may take place, and means for providing a damper for the diaphragm by the aid of the magnetic current to increase and decrease the vibrations of the diaphragm. Certain details of construction are also covered by the patent.

A PRESENT TO A PRESIDENT.—The students of the Pacific Business College, in this city, surprised Prof. T. A. Robinson two days before New Year's, by giving him a handsome black cane, with an elaborate gold handle, suitably inscribed. Felicitous presentation speeches were made by Messrs. A. D. Ewing and W. A. McNamara; and Pres. Robinson, though taken off his guard by this manifestation of his pupils' kind regard, responded in a strain playful yet feeling.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not kindly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

The stock market has been rather quiet. Hale & Norcross had a slight spurt and the Bodie stocks also had a small rise. A number of old stocks are again being called after having dropped out of sight for years. The recent advance in Comstocks has had the effect of bringing others to the front. The Virginia Chronicle gives the following list of locations around Mount Davidson on which work has been resumed subsequent to November 1, 1886: Keystone, Wells-Fargo, Gladstone, Orleans, Utah, West Utah, Scorpion, William Penn, Miami, Kollinor, North Monte Cristo, Cosmopolitan, Iowa, East Best and Belcher, North Gould and Curry, Gould and Curry croppings, Phil Sheridan, Peytona, Imperial, Bullion, West Potosi, Alpha, Exchequer, Original Gold Hill, Overman, Caledonia, Segregate, Belcher, Confidence, Bullion, Knickerbocker, Silver Eagle, Delaware, North Occidental, Senator Fair, Lady Washington, Silver Hill, Woodville, Succor, Haywood, Silver Star, Dayton, Kossuth, Niagara, Atlantic Consolidated, Golden Prize, Rogers.

The work of development will be inaugurated on the following locations by the middle of February: Sunrise, St. John, Culver, Europa, Julia, New York, Prospect, East Yellow Jacket, Trojan, Keyes, Concordia, Moore and Morgan, East Ophir, East Consolidated California and Virginia, Brophy, Suro, Rocky Bar, Lord of Lorne, St. Louis, Burning Moscow, Watson and a score of others. The Chronicle adds: "It is safe to predict that by the 1st of March the work of development will be in progress on not less than 200 mining locations that have not been disturbed by the miner's pick during the past seven years, except when the annual holding of work required by law was performed."

New York Metal Market.

Telegraphic advices dated Jan. 27th give the following New York prices:

BAR SILVER—\$1.02 1/2 per oz.	
BORAX—3 1/2 @ 6 1/2 c.	
COPPER—Lake—11 1/2 c.	
IRON—No. 1, \$19.00 @ 19.50.	
LEAD—\$4.50.	
QUICKSILVER—\$4 @ 55c.	

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, spot closing at 11.60. Transferable Notices (Lake) issued at 11.60. Transferable Notices (Chili Bars) issued at 12.39 5/8.

LEAD—Steady at \$4.33 @ 4.50 spot. Transferable Notices issued at \$4.50.

TIN—Quiet at \$22.60 @ 22.70. Transferable Notices issued at \$22.65.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.75 @ 22.90; Billiton Tin, \$23.10 @ 23.40; Banca Tin, \$23.15 @ 23.50; Baltimore Copper, \$10.75 @ 10.95; Orford Copper, \$10.75 @ 11.00; P. S. C. Copper, \$10.50 @ 11.00; Foreign Lead, \$4.75 @ 4.85; Foreign Spelter, \$4.75 @ 4.85.

MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.00 @ 21.50; No. 2, \$18.50 @ 19.00; Grey Forge, \$17.00 @ 18.00; Hudson River, Grade No. 1, \$20.00 @ 21.00; No. 2, \$18.50 @ 19.00; Grey Forge, \$16.00 @ 16.25; South, Grade No. 1, \$19.50 @ 20.50; No. 2, \$18.00 @ 18.50; Grey Forge, \$17.00 @ 17.50.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., Jan. 25, \$48,000; Germania, 19, \$12,682; 20, \$32,914; Hanauer, 20, \$5220; Moulton, 20, \$18,210; Alice, 20, \$20,400; Hanauer, 21, \$2590; Alice, 22, \$10,242; Hanauer, 22, \$2570; Bannock, 20, \$3625; Hanauer, 23, \$2580; Germania, 23, \$3318; Stormont, 19, \$3260; Con. Virginia and California, 23, \$13,000. Last week Wells, Fargo & Co., shipped from Salt Lake City in bullion, \$70,703; McCormick & Co., \$34,562; T. R. Jones & Co., \$62,294; and Union National Bank, \$12,370.

The Anaconda smelter consumes 180 tons of coal and 125 cords of wood per day.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, \$3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers.

252 Market Street, San Francisco.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish to those who pay fully one year in advance of date, if REQUESTED, the following articles (while this notice continues) at the very greatly reduced figures named at the right:

- 1.—World's Cyclopaedia, 794 pages, 1200 illustrations (exceedingly valuable). \$0.50
- 2.—Dewey's Patent Elstis: Binder (cloth cover), name of this paper stamped in gilt. .50
- 3.—To New Subscribers, 12 select back Nos. of this paper. .Free
- 4.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per cent. off regular rates.
- 5.—Pacific Coast and Eastern Railroads, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent. off advertised retail rates.
- 6.—Picturesque Arizona, 380 pages, in cloth and gilt. .25
- 7.—California, 100 pages, Magazine, 1880 to 1882 (3 Vols), single Nos. .083
- 8.—Per volume, unbound, 5 Vols., .20
- 9.—Per volume, bound, cloth back and stiff paper (about 600 pages). (Send two cent stamp for sample). .40
- 10.—Dewey's Patent Newspaper Fileholder (18 to 36 in.). .25
- 11.—Life among the Apaches, 322 pages, stiff cloth. .15
- 12.—Architecture Simplified, 60 pages. .25
- 13.—Webster's Dictionary, 634 pages, with 1600 illustrations; very handy and reliable. .50
- 14.—De Groot's History of Mining in California, 16 pages. .05
- 15.—Beautiful Poetic Review, entertaining and instructive, 35 pages (a handsome and pleasing present). .25

NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F.

Send for further information desired. Inform your neighbors about our office and paper. Sample copies of this paper mailed free to person thought likely to subscribe.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores," that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Ore; Mixing and Churning; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucible; Sulfuration; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Corrosive Material; Assay of Roasted Ore for Solubility; To Assay a Cupel by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 1/2 pages, with illustrations, well bound in cloth, 1884. Price, 50c. postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

PARTS II and III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process of Assaying; "Fotassage;" Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 1/2 pages, with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

THE GOLDEN STATE ROCK-CRUSHER is the one which received the Grand Medal at the last Mechanics' Fair, for the best rock-breaker and granulator. It is a combined rock-breaker and fine ore crusher, built on a new and novel principle, so that a large percentage of the ore crushed is as fine as if it came from stamps. It first crushes and then granulates by forcing the fragments of ore to rub together. Another form on the same principle is adapted for prospectors, assayers, samplers, etc. The advertisement in another column gives further details.

OWING to the crowded state of our columns this week in publishing our annual mining review, we are unable to give place to the account of the pleasant reception of Irving M. Scott, of the Union Iron Works, by the employees, on Wednesday evening.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

WORKS OF THE NEW YORK MUTUAL GAS LIGHT CO.,
New York, August 22, 1886.

Messrs. Rankin, Brayton & Co., San Francisco, Cal.:

GENTLEMEN—Yours of the 22d of May at hand, and in reply would say we have four
270-Horse Power and one 60-Horse Power Boilers of HAZELTON type at our works.

Their record with us has been "FIRST-CLASS." Our first one (270 H. P.) has been in
use nearly six years, running night and day, and has cost nothing for repairs. They give
dry, cheap steam. I consider them the best Boiler made. Yours truly,

N. F. ALLEN, Superintendent.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman
strength. On one occasion he slew several giants who opposed him, and with one blow
of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other
Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize
the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

This cut represents our
**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

Send for Circulars and Price List.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Mining Assessments.

During the past year, so far as the record has been kept, there were 86 mines in the Pacific States and Territories upon which assessments were levied, the aggregate number of assessments being 143 and the total sum called for was \$3,024,674. In 1885 the number of mines assessed was 105, the number of assessments being 162, and the total amount \$2,701,150. In 1884 the amount was \$4,724,700; in 1883, \$5,885,784; and \$7,630,000 in 1882.

The mines assessed in 1886, the number of assessments levied, and the amount called for by each mine, were as follows:

Mines.	No.	Amount.
Alpha Con.....	1	\$15,000
Alta Con.....	2	51,573
Andes.....	3	37,500
Bed Rock.....	1	5,000
Baker Divide.....	2	5,000
Belcher Con.....	1	3,000

Utah.....	2	20,000
Virginia Creek Hydraulic.....	1	1,000
Wm. Penn Con.....	1	2,000
Yellow Jacket.....	1	90,000
Totals.....	143	\$3,024,674

The foregoing assessments, summarized, show the following distribution, as compared with 1885:

	1885.	1886.
California.....	\$499,100	\$426,500
Nevada.....	1,873,350	2,351,174
Arizona.....	238,000	209,000
Alaska.....	5,550	5,000
Idaho.....	4,000	4,000
Utah.....	4,000
Dakota.....	30,000
New Mexico.....	2,000	10,000
Mexico.....	55,200	19,000
Totals.....	\$2,701,150	\$3,024,674

The following shows the apportionment according to districts:

California—Amador, \$16,000; Butte, \$30,500; Inyo, \$20,000; Los Angeles, \$20,000; Mono, \$104,500; Nevada, \$31,500; Placer, \$107,000; Sierra, \$25,000; Tuolumne, \$15,000; Yuba, \$75,000; total, \$426,500.
Nevada—Elko, \$195,000; Esmeralda, \$175,000; Eureka, \$150,000; Humboldt, \$16,500; Lyon, \$5,000; Nye, \$75,000; Storey, \$1,787,174; White Pine, \$15,000; total, \$2,351,174.
Arizona—Gila county, \$7,000; Maricopa, \$5,000; Pima county, \$197,000; total, \$209,000.
Alaska—Fish River mining district, \$5,000.
Idaho—Custer county, \$3,000; Wood River district, \$1,000; total, \$4,000.
New Mexico—Black Range district, \$10,000.
Mexico—Sinaloa, \$19,000.

TOMBSTONE.—A dispatch from Benson, A. T., dated Jan. 21, says: The Grand Central mining company want about 500 men, so rumor goes, to work in their enormous mines, which have been closed to business for some time. The county is all excitement over this news, and if it is true good times are ahead for the people of this vicinity.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings oftentimes prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice for a period of one year of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$8 and additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, cogs or pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER.

659 CLAY STREET.

PHOTO SPECIALTY GALLERY

Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs, lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and large towns. Address, for further information, S. F. PHOTOGRAPHING CO., 659 Clay St., S. F., or the office of this paper.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, JR.

This now and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dwyer & Co., Publishers, 253 Market St., San Francisco.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

ED. G. LUKENS, Manager.

WANTED.

A PARTY, OWNING A LARGE GOLD Quartz Mine, with free water-power and other appliances, now ready for the mining of 100 tons ore daily, where mining and milling can be done for \$1 per ton, desires some person to join in the erection of a mill. Only principals need apply to P. O. Box 2463, San Francisco, Cal.

Applegarth's Ore-Roasting Oven.

Our new ore oven is the best in the world for separating the base from the precious metals. The furnace is intended to be worked right at the mine itself, where the ore is produced. It uses very little fuel indeed, and is perfectly economical and practical. Royalty for sale.

JOHN APPLGARTH,
East Oakland, Alameda Co., Cal.

THE ORIGINAL Roller Ore Feeder

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Alameda county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,

AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,

(signed) N. W. CROCKER, Supt.

SAN FRANCISCO, Jan. 3, 1887.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: Having used four (4) of the "Roller" or "Templeton" Ore Feeders, built by the Golden State and Miners' Iron Works, of this city, for more than a year last past, in the Bollo Gopher Mill, in El Dorado county, this State, and being acquainted with the superior principles of construction and the operations of the "Challenge" Feeder built by yourselves, I unhesitatingly indorse the statements made by Mr. N. W. Crocker, Superintendent of the "Bunker Hill" Gold Mining Company, under date of July 12, 1886, as to the irregularity of the feed of the "Roller" or "Templeton" Feeders under the conditions of use which his names, and I am very truly yours,

(Signed) W. G. ROBERTS,
Of Greenwood, El Dorado Co., Cal.

HENDERSON'S PATENT TRUSS.

Comfortable and Reliable.

This simple truss can be worn without inconvenience, and gives all the comfort to the wearer that can be obtained from a perfect-fitting, pliable apparatus. The pad is soft and yielding, and on account of its peculiar construction and the connections of its securing bands, cannot get out of place. It will remain in place no matter what position the wearer may assume. The engraving shows the construction of the appliance. It is simplicity itself, and is comfortable and reliable. Address,

JESSE G. HENDERSON,
Grizzly Flat, El Dorado Co., Cal.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

WHAT IS SAID OF THE THOMSON &
EVANS PUMP.

JEFFERSONVILLE DEPOT OF THE
QUARTERMASTER'S DEPARTMENT,
JEFFERSONVILLE, IND., August 1, 1885.

Messrs. Thomson & Evans, San Francisco, Cal.:

GENTLEMEN—In January last we received from you one of your Fly-wheel Pumps, size No. 11, fitted with extension shaft and belt wheel. It has been given a most fair and thorough test at this depot, and I feel satisfied that it will perform more service with less wear than any direct-acting or fly-wheel pump that I have ever seen.

Besides my recommendation for this particular pump here, I wish to add my commendation of the merits of the pump you put in the engine house at the Presidio, San Francisco, a few years ago, while I was stationed there. At that time I made critical tests of its capacity, and do not hesitate to say that it is the best and most economical pump that I have ever come across in the course of a long experience.

I inclose you a letter from our Chief Engineer, showing what he personally thinks of the pump you sent to this depot. Yours truly,

ED. W. HEWITT, Chief Clerk.

JEFFERSONVILLE DEPOT OF THE
QUARTERMASTER'S DEPARTMENT,
JEFFERSONVILLE, IND., August 3, 1885.

Messrs. Thomson & Evans, San Francisco, Cal.:

GENTLEMEN—After thirty-three (33) years' experience with almost every kind of pump, I consider your "Fly-wheel Pump," received at this depot last January, the best and least complicated I have as yet seen. It fully comes up to all you claim for it.

Yours respectfully,

JOHN W. TIMMONDS,
Chief Engineer.

Saving Floured Quicksilver.

As recently stated in the PRESS, experiments are being carried on in Nevada, in the direction of recovering the floured quicksilver and amalgam in the sands of the bed of the Carson river. These sands are mainly tailings from the quartz mills near by, and are the accumulations of years. When it is remembered that from one to three pounds of quicksilver are lost with each ton of ore worked, and that this quicksilver carries off some of the precious metals with it, one can see how much wealth lies in the river. The question is, how to recover this.

A company has been formed to dredge the river and to work these tailings; and experiments are being made to prevent any more such loss as that described, by collecting the floured quicksilver before it passes off with the tailings.

A representative of the PRESS visited the Pacific Iron Works in this city last week and met Dr. J. H. Rae, who is the inventor of the apparatus and process designed to save floured quicksilver. He demonstrated the general plan by a simple experiment, witnessed by several persons.

An ordinary gold-pan was nearly filled with the material taken from the river-bed and water added. The two poles of a battery were then connected with the material, and it was left standing a short time. The material was then panned out in clear water, and an ounce or more of mercury, apparently containing some amalgam, was the result. Very little "floured quick" could be seen around the edge of the pan. Then a pound or so of the same material was panned down, in another pan, without being treated by electricity. The whole edge of the pan was found to be white with the floured mercury, but it would not consolidate in a mass as when treated by the electricity.

As a laboratory experiment, this shows conclusively that the treatment by electricity has the effect of bringing the floured particles together in a mass of sufficient specific gravity to admit of saving it. The thing now to be done is to carry out the same plan on a practical scale. An apparatus to do this is being built at the Pacific Iron Works, and is the invention of Dr. Rae. It is an ordinary amalgamating pan or tub, within which the usual rotary

muller or settler-arms are operated. It is so arranged, however, that a current of electricity is applied through the mass of pulp or tailings under treatment.

In order to overcome a certain amount of resistance to the electrical current which is developed in the water, certain chemical substances are added. The strong current of electricity which is passed through the material results in aggregating or bringing together the fine particles of floured quicksilver which are usually lost or carried away in the water, because it is impossible to unite them by ordinary means into a body large enough to be collected.

The Tehachepi Loop.

Tehachepi, 120 miles from Los Angeles, is the highest point on the railroad (3964 feet) between San Francisco and Los Angeles, and is the name of the coming together of the mountains of the Sierra Nevada and the Coast Range. Between Tehachepi and Caliente, 26 miles further west, is the famous "loop," considered by surveyors and civil engineers as one of the most remarkable specimens of railroad engineering in the world, the peculiarity being that the road, in climbing the elevation, is made to cross itself. Its exact location is 352 miles from San

lowed elsewhere. It was claimed by some German engineers that they had used it first. Still investigation proved that their work was commenced after this was completed, which virtually settles the question of priority.

In the construction of railroad on this coast in the mountainous regions, many problems were met and solved by the engineers which were new in railroad work. This is but one of them. Most of them seem simple when the results are seen, but in the designs and construction great skill and genius have been shown. Obstacles were met and overcome, which, in some places, would have been considered insurmountable.

There were not very many choices of routes, however, so that the engineers had to do in some way what was required of them. Their work speaks for itself, and all who have ever had occasion to examine it critically speak in the highest terms of the engineering skill displayed.

IRON continues very firm. The advance East has led some manufacturers to draw on Great Britain, and several heavy purchases are reported. One is for 100,000 tons to be laid down in New York at \$19 per ton, tide-water delivery. The purchaser was a manufacturer of pipe. Nails are rapidly rising in sympathy with this advance in iron. A local circular says that the advances made in metals in the American and British markets are fully sustained, and are now being more sensibly felt here. Consumers generally are carrying full stocks for immediate requirements, but the stocks in first hands are materially diminishing. This, combined with the light shipments afloat, should lead to better figures in the near future.

The past year was not a big one in the way of mining in Beaver Co., Utah, and yet in some directions good progress was made. The town of Frisco, once so full of life in the palmy days of the Horn Silver mine, has been very quiet since the big cave in the lower levels of the Horn Silver mine, 23 months ago; there has been an average of probably 35 men employed.

THERE is a bill before the Nevada Legislature to encourage prospecting and developing mineral resources by giving a bounty.

THE LOOP IN THE SOUTHERN PACIFIC RAILROAD, AT TEHACHEPI, CALIFORNIA.

These particles are brought together either by attraction or some other reason. The apparatus referred to will soon be placed in the Douglas mill and practical experiments made with it on a scale sufficient to demonstrate its usefulness. It is the intention to introduce the system in the ordinary mill process in order to prevent the waste of quicksilver and amalgam which goes on under the present condition. Thus far Dr. Rae is only confident that experimentally the system is a success. How it will work practically in a mill remains to be seen. This question will soon be answered, however, and when the results are accomplished we shall give the details of the trials.

OIL WELL No. 6, at Puente, caught fire the other day and the derrick, engine and other machinery were all burned and the well itself destroyed. Loss about \$25,000.

THERE are about 3000 hands employed in the drift mines of this State, the annual product of which amounts to about \$5,000,000.

Francisco, or 130 miles from Los Angeles. The length of the loop is 3795 feet; lower elevation at tunnel 2956 feet, and upper elevation, at grade over tunnel, 3034 feet; difference in elevation, 78 feet. The engraving on this page (from Major Truman's book describing the Sunset route of the Southern Pacific Co.) shows the general features of the loop, the entrance to tunnel and the crossing.

It is interesting to note in connection with this engineering feature that the plan has since been adopted abroad, and in Germany they now have several examples of the same kind of railroad work.

It has been erroneously claimed that the foreign engineers originated the idea and that the California "loop" was simply a repetition. This is not so. Inquiry at the engineering department of the railroad company here develops the fact that this Tehachepi loop was the first one of the kind ever made, and the plan was devised and carried out by the engineers of the company. Since then many engineers have examined it, and, as stated, the plan has been fol-

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Old Belt Mining District, Montana.

[From our Travelling Correspondent, R. G. HUSTON.]

During this past year there has been quite a revival in the old Belt mining district, Meagher county, Montana. It is located 25 miles east of Helena. One reason for the renewed interest aroused is that a company of Michigan capitalists have bought all the individual interests in the two drain-ditch companies on Trout creek. They have, during the past season, built some immense reservoirs to hold the water of the main creek, and are intending to boom the creek out to headrock by turning immense bodies of water down it. They have all the necessary preparations made, so that on the opening of spring they will commence active operations, and the success or failure of the scheme will not be long delayed. The supervision of the project is attended to by Mr. Spratt. At this time of my visit he was East, and what I learned of it was from outside parties. I cannot say that I am envious of their succeeding, but will wish them well, at any rate.

The quartz interests have been revived, and a number of very flattering locations have been made. A Philadelphia company fell by the wayside in this camp for some \$250,000 or \$300,000, and a number of individuals fell for smaller amounts, which virtually killed the camp. One by one all the mills were moved away, but a few of the old-timers remained in this country. Among them were George Clarke and Valentins Heinrich. They were prospecting this past season along with Messrs. Dougherty and Stevens, and concluded they would spend a short time among these old hills that were so eagerly sought and sold so many years ago.

Their first location was the Golden Messenger, in Brown's gulch, about one and one-half miles from the old placer mines, in New York gulch, also a tributary of the main Trout creek.

They have traced this ledge for over 1000 feet on the surface and have sampled it in many places. Ore has averaged from \$12 to \$21 per ton in free gold. The size of the ledge varies from 18 inches to 4 feet. They are now hard at work sinking on the property, and if the prospect continues good as at the present, until spring opens, they will be well satisfied with their year's labor, and will then fix themselves to handle it in good shape.

The Little Dandy is another location near by, and is owned by the same parties. This is in a granite formation and is a ledge 3½ feet in thickness. An average assay taken from this 3 feet from the surface, and across 3½-foot ledge, went \$10. A number of assays have been obtained from choice portions, running as high as \$150 to the ton. This is all free-milling ore, and fine prospects can be obtained by pounding up in a mortar and the old pan process. They have a number of other locations here, among them the Assayer's Delight, but the first two mentioned will receive their attention first in the line of development.

In the old Upper New York district they made a discovery on the opposite side of the gulch from where the Gold Mountain lode that the Philadelphia Co. squandered \$50,000 on, was located. This is a contact vein between slate and granite, carrying a width of from 18 inches to 2 feet; average assay of full width return \$35 gold and 2 oz. silver. It is a strong, clear-cut vein; dips to the north at an incline of 40° and is running parallel with the gulch. It can be easily traced on the surface for 4500 feet along the ridge.

This is the case of an old camp turning into a new one, and I would not be surprised to hear of very favorable results from some of these locations. The camp had run to eolow an old Uncle Samuel has taken away their mail facilities, and now their nearest post-office is Cregar Ferry, some 12 miles up the river from there. The poorest wish I have for them is that they may regain and hold their population of 1867.

Leaching Ores.

EDITORS PRESS:—In reading the very interesting and useful articles on leaching silver ores, by Mr. C. A. Schenck, I observe that the floating hose for drawing off the silver solution was found to work too slowly.

I venture to say that I see no reason why a floating hose may not be made to work as rapidly as may be desired, but the diameter of the vat should be at least equal to the depth to the point of insertion of the hose. By a proper arrangement of the float, the liquid may be drawn at any desired depth below its surface. The hose may be of any required diameter, even to a foot or more, but, if much over two inches, it should be made with coiled wire between its layers, in order that it may not kink or collapse.

We are not informed as to how the joint in the iron pipe, used at the works described, is made and kept tight. Perhaps there is no great difficulty in this, but I think I should prefer the hose as being safer. For the rest, the pipe might be arranged with a regulating float quite as well as the hose; either is better than the

series of plugs or pipes at different levels used in some works. In regard to plugging the holes through which the solution flows from the trough to the precipitating vats, I have found the best arrangement to be to have a short piece of lead pipe (nipples) fixed in the holes, and to use a wooden plug with a *thimble*, consisting of a couple of inches of rubber hose into which the tapered end of the plug is firmly driven. This thimble may be tapered, if necessary, by shaving with a sharp knife. With a little tallow on the thimble, a perfectly tight closure may be made by hand pressure, hammering the plug being needless. C. H. AARON.

Nogales, Jan. 24, 1887.

The Big Patent Fight.

The argument in the great telephone cases has commenced in the Supreme Court of the United States, and will continue two weeks. This records in this case have grown to an enormous proportion. There is now before this court 15,000 pages of printed matter, besides voluminous briefs. An unusual interest attaches to these suits and the final result will be waited for with solicitude. The general question at issue is the validity of the Bell patents, between the American Bell Telephone Company and its dozen or more opponents and competitors. The Government case, known as the Pan-Electric case, contains no material point not included in the cases now on argument. These cases consist of five appeals from decisions of the United States Circuit Court, favorable to the Bell Company. These decisions were made in Massachusetts, New York and Pennsylvania, and are known as the Dolbear, the Molecular, the Clay, Drawbaugh and Overland cases. The appeals are to be argued as one case. It may be of interest to some of our readers briefly to summarize the grounds of these appeals:

First—That the claim that the Reis instrument was a perfect operative telephone, acting upon the microphonic principle, and therefore a full and complete anticipation of the Bell patents.

Second—That the Reis instrument, while not a perfect operative speaking telephone, yet was an instrument designed for and capable of transmitting by electricity musical tones at least; and as such defining the state of the art, and therefore limiting Bell's claims to the instrument shown in the patent alone.

Third—That the instruments described in the Bell patents are inoperative as a speaking telephone, and that therefore his patent, so far as it is said to cover a telephone, is void.

Fourth—That Bell got his patent by fraud, and that it is therefore void.

Fifth—That the principle sought to be covered is not patentable, and that the patent, therefore, be limited to the device shown.

Sixth—That the instruments made by Drawbaugh were in existence before March 10, 1876, the date of Bell's first patent, and were therefore an anticipation.

Seventh—The Dolbear defense admits the validity of the Bell patent, but claims that Dolbear's machine works on a different principle, and therefore does not infringe.

All but one of these appeals assails Bell's first patent, that of March 10, 1876. This patent might be broken down by the Supreme Court and the second patent of January 30, 1877, still hold the field against all comers. It is claimed that the Drawbaugh instruments contain all the elements of Bell's second patent, and were in existence before Bell secured his last patent. In that case this huge telephone monopoly will be broken down and competition left open to half a dozen patents, a "consummation devoutly to be wished."

The Eastern journals are not very hopeful of relief from this gigantic monopoly. The New York Herald calls attention to the fact that Judges Gray and Lowell have already, in the lower court, rendered opinions favorable to the Bell patents, and that they are surrounded by a host of relatives and friends who are large owners of the Bell stock. The Herald gives the names and addresses and the number of shares of stock claimed to be held by the relatives of these two judges. This does not look favorable for the public welfare. Then it is known that some of these cases are collusive, and are intended to uphold the Bell patents. Have the people, then, no remedy against this powerful and odious monopoly whose existence they have made possible by enacting patent laws? The experience of Indiana shows that State laws restricting rates do not furnish a remedy. The New York Times intimates that it might be well to overhaul and remodel our entire patent system if it will result in putting an end to such monopolies. It says:

The power which the telephone monopolists are exercising was given to them by the people, and it is the people who now suffer under the exercise of it. What will they do if, with evidence of the fraudulent procurement of the patent before them, their agents shall not be able to obtain justice? Surely there will arise a feeling of great hostility toward our patent system, and this feeling will be manifested in legislation. Our patent system should not be overthrown, but the abuse of its privileges by such corporations as the Bell Company exposes it to attacks that may greatly weaken it.

An important discovery of coal oil has been made near Mountain View in the Coast Range mountains. The supply is to be conducted to Mountain View, thence to San Francisco. It is located on S. Weilheimer's lands.

Friendly Demonstration by Mechanics.

Irving M. Scott Serenaded.

Irving M. Scott, of the Union Iron Works of this city, returned this week from Washington, where he has been for the past nine months arranging about getting this contract for one of the Government cruisers. He succeeded in obtaining the contract for Cruiser No. 2, which will be built here. On Wednesday of last week a delegation of the Molders' Union called on Mr. Scott and presented him with an immense floral design, representing a model of the Charleston. The floral ship was over eight feet in length. Mr. Scott, in response to a short address, assured the committee of his goodwill and a desire to do everything in his power to advance the interests of the workmen in his employ.

Shortly afterward the men employed in the other departments of the works, several hundred in number, visited the residence, accompanied by the Second Regiment band, and serenaded Mr. Scott. After the band had played a few airs, Mr. Scott left the members of his family, who had assembled on the portico to welcome the men, and descended to the foot of the steps, where General William H. L. Barnes, in a very happy speech, expressed, on behalf of the employees of the Union Iron Works, their appreciation of his successful efforts in securing to San Francisco and the mechanics of San Francisco, a recognition of their capabilities.

In response Mr. Scott said:

This demonstration in support of the Union Iron Works in their efforts to sustain the industries of this coast fills my heart with joy, nerves my arm and almost makes me feel ready for a fight against all the Eastern manufacturers combined; and if you will stand by the Union Iron Works, and make Cruiser No. 2 a success, you will have a long and prosperous run of work. I am of the opinion that by this time you ought to know which is the real friend of the workman—the men who give you all work and pay you the agreed wage at the agreed time, or the men who give you a regular talk at regular intervals, and never a day's work nor a dollar. Now we have the contract, and upon us will depend whether it is to be a success or not. If you stand by the ship we will all be saved or all lost by her; and if I could tell you the trials and tribulations of the last nine months, you would know how to estimate the value of bringing a million of Government money to this coast and distributing it among the working people of this coast. That money represents the wages of 1000 men at \$3 per day for 325 days, which means the bread and butter to at least 4000 people. That of itself is an important fact. But it means more. It means the establishment of a credit for ability with the Government, and is only the key to unlock the Treasury, and in coast defenses and harbor defenses distribute again in the channels of trade what the Government has gathered from you in the shape of revenue and taxes, which amounts to an annual sum of \$11,000,000. When we asked the Government for this ship we were confronted with three objections:

First—We had not the facilities to build a ship. When the commission appointed to examine the plant of the Union Iron Works reported that it was unequalled in the United States, it settled objection No. 1.

Second objection was, no skilled labor could be had in San Francisco. The building of the caisson for the Mare island dock, which fitted so perfect that not a file or chisel touched it after leaving the works, settled the second objection, and is a matter of record in the archives of the navy.

To No. 3, that no materials could be had on our coast, we took the objection out to the steps of the Capitol, where the piece of steel which you finished in the Union Iron Works stood. And as this was at that time the largest piece of steel they had ever seen, it was a complete and overwhelming answer to their last objection.

And when the bids were opened and the Union Iron Works was lower on the two first cruisers, it answered all the Eastern shipbuilders' questions and burst their brags that no one could compete with them. And now you are on your mettle, boys, and are obliged to stand by us and make that ship beat anything afloat. And this unexpected spontaneous expression of goodwill to-night gives us good cheer; and above the coronet of kings, the power of wealth, or the pride of position, give me the goodwill and hearty support of my fellow-workmen. Thanking you from the bottom of my heart, I wish you a full-round prosperous time and the substitute of arbitration in the place of strikes and persuasion in place of force.

At the close of Mr. Scott's address cheers were given, and the large crowd moved away with flags flying and the band playing "Home Again."

A MINING MACHINE.—The Stockton Mail makes a short mention of a machine conducted on an entirely new principle, centrifugal force being applied for use, on a gravel claim near Campo Seco, in Calaveras county. The machine was started a few days ago and exceeds the expectations of the owners. Four tons of gravel were run through in 10 minutes. It will require the labor of 30 men to supply the material from the claim to keep the machine going. Boulders six or eight inches in diameter, iron, cement and other hard substances are in a flash reduced to powder, and when the machine is in good running order, it will reduce a ton in three minutes. In the estimation of miners the new machine will create a revolution in gravel mining. A machine that knocks iron and boulders into powder in a flash must be built of some new sort of material to stand the wear. The thing that wears such substance must get worn. The Mail's story reminds us of the man who discovered a universal solvent, but was not able to use it because he could get no vessel to hold it.—Ex.

Determined Miners.

They Wanted their Pay before the Mine Shut Down.

A dispatch from Helena, Montana, dated Jan. 27th, says: Advice from Gregory states that this place is in a state of siege, the works having been closed down and the miners having taken possession of the town. Gregory is a mining camp near Wicks, southeast of Helena, where the Gregory Mining Company conducts its milling and smelting operations, giving employment to 300 men. To-day A. J. Selligman, B. W. Child, E. W. Bach and Thomas L. West, all stockholders in or officers of the company, went out to close down the works, the finances of this institution having arrived at such a condition as to make a suspension of operations imperative. The company has been running behind for months, and now some of its wealthy stockholders whose means have been used to carry on the operations have refused to put up any more money. On arriving at Gregory and making known their mission to the men, Messrs. Selligman, Child, West and Bach were promptly taken into custody by the exasperated miners, who have two months' pay due them. The works were immediately shut down and the men took possession of the town. This company's treasury is empty and there is no visible resource on which a draft can be made to obtain sufficient funds to pay off the men. It is learned later that Selligman and Child have been released to come back to the capital and devise means for payment of the back wages. The other two gentlemen are to be held as hostages for their safe return. Meanwhile Gregory is in possession of the miners, who are peaceably inclined and allow no disorderly proceedings. They are determined and were holding the fort persistently at last accounts. The local managers here in Helena are making arrangements to pay the men. It is claimed that if more money had been advanced from New York and a branch road built from the Northern Pacific to the works, the operations would be profitable.

A dispatch dated the following day has this additional information: Drafts for the amounts due the employees had not reached Helena, and the men, fearing that they were to lose two months' wages due, on being notified of the company's intention, called a meeting and took charge of the mine and works. They then went in a body and notified the gentlemen named that they wanted them to attend their meeting in the hoisting works. One hundred and fifty men walking in front, and 175 behind, escorted them to the meeting. Speeches were made on both sides, and the men decided to hold the four gentlemen named until the money was forthcoming. They detailed eight men to guard them during the day and eight men during the night. They voted to close every saloon and detailed men for that purpose, which was strictly carried out. They also appointed a committee to inspect all telegrams and correspondence. Later in the day they decided to allow the general manager to go East to secure the money, at the same time paroling the accountant and foreman, but still holding Mr. Selligman a prisoner for security until the money was paid.

Mr. Selligman telegraphed to his father in New York that if the company did not pay the men he would not answer for the consequences, for the protection of the property or himself. The amount involved was \$75,000, and J. & W. Selligman & Co., owning but a portion of the company's stock, immediately telegraphed the money to Helena for the payment of the men and to release the company's property and Mr. Selligman.

About midnight Mr. Selligman was released, upon a messenger being sent to the men, who guaranteed the money for Selligman & Co. The men treated their prisoner and all parties with the utmost respect and courtesy, and protected the company's property, no disposition being shown to injure any one. Mr. Selligman was paroled and allowed the freedom of the camp, on his word of honor that he would not leave, and that payment of the money would be made to the men. They are being paid off to-day, and all hands are happy over the result of what might have been a serious affair had not the New York bankers promptly stepped in.

QUARTZ MINING.—Quartz mining is the backbone (spinal marrow included) of the prosperity of Nevada county, says the *Foothill Tidings*. Fruits and trees and vines and factories come in and help. They are ribs, as it were, of the structure of prosperity. The vines and trees will take the place of quartz mining when our quartz veins shall have been worked out. That will occur somewhere about 400 or 500 years from now. Our quartz mines make the market for the productions of the trees and vines; a home and cash market. And our quartz mining is a safe and legitimate business. No one wants to stop it; it would not pay the valley people to try to stop quartz mining, and they are not going to try. Therefore, plant all the trees and vines you can. Trees and vines grow well right on the top of our best producing quartz ledges, but when you dig a hole for trees look well into the excavation, for the digging may show you a quartz ledge. That sort of thing has often happened. Do any kind of work and study up the work that will do this section good. Promote and encourage every kind of industry; but while doing so keep your best eye on quartz mining.

Smelting in Colorado.

The old year closed with the smelting industry in far better shape than when it opened. In the summer of 1885 a war between the smelters was begun, which was continuing at the end of the year. Smelters were paying such prices for lead ore that there was little or no profit in the business. The war came to an end when the price of silver declined below \$1 per ounce, and the price for smelting was advanced to a paying, but still low basis. During the early part of the year the competition of the valley smelters outlasted work very seriously at the Leadville plants, and for a time there was talk to the effect that all the smelting would of necessity soon be done in the valley towns, owing to their advantages for obtaining cheap fuel, limestone and cheap freight rates to the East on bullion. But when the Pueblo works drew out of the Leadville market, and the price for treatment advanced, the industry revived at Leadville. It was aided materially by a largely increased output of the mines, and the Leadville plants are now treating about 900 tons daily, making the city the leading smelting point in the State.

One year ago oxidized lead ores, in which the iron balanced the silica, were treated for \$2 per ton, and 45 cents per unit was the price for lead. Ores rich in lead were treated for nothing, and 45 cents per unit paid for lead. Five per cent was deducted from the New York quotations on silver on these classes of ore. The hardest of all ores to treat, the zinc sulphides, containing an excess of silica, were treated for \$15 and seven per cent off from silver quotations. Now, the best ores bring only 40 cents per unit for lead, and this treatment charges vary from \$4.50 to \$5.50 per ton. Now zinc sulphides are treated for \$16 per ton, with a charge of 50 cents for each per cent of zinc over 10.—*Denver Tribune-Republican.*

Snake River Placers.

The Snake river placers are now being advantageously worked, from Eagle Rock for hundreds of miles down the river.

The gold-bearing gravel lies in immense banks, or what were bars when the river was higher and larger than it is now. They extend along the river, with low channels sometimes cutting them in two or crossing them. They vary, therefore, in width from a few feet to as many miles, and in thickness from a few feet to 200.

The only drawback is the extremely small size of the particles of gold; coarse gold is unknown on Snake river, but from Eagle Rock, in Oneida county, to the mouth of the river gold can be found of such exactly similar metallurgical conditions, both as to fineness in grade (shape of grains being scale-like in form) and fineness in character of grains, that it might have come from either end of the river. On the alluvials of this river gold is also found, but even within half a mile of its mouth 'Boise' gold sinks to an assay fineness of from 720 to 780, while that from the river under review will assay over 900, and even 990. The shape of the grains is noticeably a feature of Snake river gold, being so flat and scale-like that the precious metal is often seen floating on the surface of the water, while gold from any of the feeder streams assumes more the character of shot gold, is coarser and much more easily harnessed to the service of man. Its extremely small size is also a distinguishing mark of this gold. Other minerals produced in Idaho are copper, lead, coal and salt. Marble exists along the valley of the Snake, and mica has been found in Washington county and in North Idaho.—*Portland News.*

BUTTE, MONTANA.—The successive copper and silver crises which threatened the prosperity of Butte having happily been triumphantly survived, it may be safely assumed that the future of this district is beyond the pale of uncertainty and bright with the jewels of well-grounded hope. On every side are visible evidences of present and future successful achievements in the mining field. In the early spring the Anaconda will be in shape to produce 5000 tons of copper per month. The erection of another 60-stamp mill is in contemplation by the Bluebird company. The condition of the Mountain View already warrants the building of a 250-ton concentrator and smelter. The Clark's Colusa plant is already inadequate to treat the product even of the mine so named, not to mention a half dozen other copper properties with which the owner is identified. The Clear Grit requires a smelter and can supply a big one with plenty of copper silver ore. The Chambers' Syndicate properties, now undergoing thorough development, will soon rank among the heavy producers. The Goldsmith and Wabash will resume operations within three months. The Josephine, Flag, Cora, Golden Rule and Mountain Chief may be implicitly relied upon for continued heavy contributions to the custom mills, while the Amy & Silvermith, with its dividend record of nearly \$200,000 during the past year and its handsome treasury surplus, can furnish lively occupation to a 20-stamp mill for an indefinite period, even from the present opening.—*Inter-Mountain.*

If you want to make a fortune you must produce something that appeals to the millions, not to the millionaires.—*Jacksonville Times-Union.*

Quicksilver.

The following tabular statement shows the extent of our export trade by sea and the shipments by rail from San Francisco and other points during the year 1886:

MONTHS.	FLASKS.	Value.	MONTHS.	FLASKS.	Value.	MONTHS.	FLASKS.	Value.	MONTHS.	FLASKS.	Value.
January.....	301	\$8,855	July.....	12	\$30	January.....	301	\$8,855	July.....	12	\$30

TOTAL.....	1,032	\$27,816				TOTAL.....	1,032	\$27,816			

Includes 500 flasks Spanish in bond, which had been brought here from London on speculation, and valued in the primary market at \$13,710, 1885.

The total number of flasks given for 1885, by sea, includes 100 for South America, valued at \$3900, and 233 for China, valued at \$6930.

The rail shipments (gross) from this State last year, according to the monthly reports furnished by the railroad company, were, in pounds, as follows:

Months.	From.	Pounds.
March.....	San Jose.....	27,000
April.....	San Jose.....	27,000
June.....	San Jose.....	27,000
July.....	San Jose.....	55,350
August.....	San Jose.....	89,550
August.....	San Francisco.....	450
September.....	San Francisco.....	38,000
September.....	San Jose.....	27,000
October.....	San Jose.....	31,500
October.....	San Francisco.....	1,350
December (1885).....	San Francisco.....	11,430

Total..... 335,600
Equivalent to flasks..... 3,730

The production of the California mines in 1886 (December estimated), compared with 1885, was as follows:

Mines.	1885.	1886.
New Almaden.....	21,400	18,000
Edna.....	1,309	3,478
Napa Consolidated.....	2,197	1,709
Great Western.....	3,460	1,949
New Idria.....	1,144	1,144
Sulphur Bank.....	1,295	1,449
Rodriguez.....	385	409
Great Eastern.....	446	735
Varadero.....	302	786
Gudalupe.....	35
TOTALS.....	32,073	29,081

The production for several previous years was as follows: 1884, flasks, 31,013; 1883, 46,725; 1882, 52,732; 1881, 60,851; 1880, 59,926.

CAVE CREEK DISTRICT, ARIZONA.—A correspondent writes from Phoenix, Arizona, that they are experiencing great mining "activity," with almost certainty of three very large sales in Cave Creek district. There will be two very large mills that will equal the Vulture plant within 60 or 90 days. Experts are on the properties from New York, and within 30 days there is promise of two different experts to report on another property, all in Cave Creek district. Material is being hauled from Maricopa, on S. P. R. R., to Gila river (between Phoenix and the railroad), and a very large force of laborers are at work grading; others are at work on the Gila River bridge.

No American city shows for 1886 a better business record than San Francisco. It had fewer commercial failures according to population than any other.

The world owes nobody a living, and is certainly not indebted to a loafer. If the world is a sea full of fish, everybody must work to get them out.

Interstate Commerce.

Important Sections of the New Law by Congress.

The principal provisions of the Interstate Commerce bill, as it passed the Senate and the House of Representatives, are embraced in the following sections:

The first section applies the provisions of the Act to any common carrier engaged in the transportation of passengers wholly by railroads or partly by railroads and partly by water, when both are used under common control, management or arrangement through more than one State or Territory or from any place in the United States to any adjacent foreign country. It defines the term "railroad" to include all bridges and ferries used or operated by any railroad. All charges made for any service rendered in the transportation of passengers or property shall be reasonable and just, and every unjust and unreasonable charge for such service is prohibited and declared to be unlawful.

Section 2 makes it unlawful for any common carrier, subject to the provisions of this Act, to charge, demand, collect or receive, directly or indirectly, from any person or persons, greater or less compensation for any service rendered in the transporting of passengers or property than it charges, demands, collects or receives from any other person or persons for doing him or them a like and contemporaneous service in the transportation of a like kind of traffic under substantially similar circumstances and conditions.

Section 3 makes it unlawful for any common carrier, subject to the provisions of this Act, to make or give any undue or unreasonable preference or advantage to any particular persons, company, firm, corporation or locality or any particular description of traffic. Every common carrier, subject to the provisions of this act, shall, according to its respective power, afford all reasonable, proper and equal facilities for the interchange of traffic between its respective line, and for receiving, forwarding and delivering passengers and property to and from the several lines and those connecting therewith, and shall not discriminate in their rates and charges between such connecting lines.

Sections 4 and 5 (the long and short haul and pooling sections) are as follows:

SEC. 4. That it shall be unlawful for any common carrier, subject to the provisions of this Act, to charge or receive any greater compensation in the aggregate for the transportation of passengers, or of like kind of property, under substantially similar circumstances and conditions, for a shorter than for a longer distance over the same line, in the same direction, the shorter being included within the longer distance; but this shall not be construed as authorizing any common carrier within the terms of this Act to charge and receive as great a compensation for a shorter as for a longer distance; provided, however, that upon the application to the commission appointed under the provisions of this Act, such common carrier may, in special cases, after an investigation by the commission, be authorized to charge less for longer than for shorter distances for the transportation of passengers and property; and the commission may, from time to time, prescribe the extent to which such designated common carrier may be relieved from the operation of this section of the Act.

SEC. 5. That it shall be unlawful for any common carrier, subject to the provisions of this Act, to enter into any contract, agreement or combination with any other common carrier or carriers, for the pooling of freights of different and competing railroads, or to divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in any case of an agreement for the pooling of freight, as before said, each day of its continuance shall be deemed a separate offense.

Section 6 requires that after 90 days from the passage of the Act, every common carrier subject to its provisions shall have printed, and keep for public inspection, schedules showing its rates, fares, and charges, and, in addition to requiring railroads to give publicity at all of their depots on their several lines it gives authority to the commission, where it is proper and necessary, to require them to give publicity to the rates to other places beyond the lines of their several railroads. It also provides that rates, fares and charges shall not be raised except after 10 days of public notice, but that they may be reduced without previous public notice. The notice, however, shall be simultaneous with the reduction itself.

Section 7 makes it unlawful for any common carrier to enter into any combination or agreement to prevent the carriage of freights from being continuous from the place of shipment to the place of destination.

Section 8 declares that any common carrier violating the provisions of the Act shall be liable to any person or persons injured thereby, for the full amount of damages sustained in consequence of any such violation, together with reasonable counsel or attorney fee.

Section 9 provides that persons claiming to have been damaged by the action of common carriers may proceed for the recovery of their damages, either in the courts of the United States or before the commission herein provided for; but not before both tribunals.

Section 10 makes it a penal offense to violate any of the provisions of this Act, and puts the

maximum fine which may be imposed at the sum of \$5000.

The 11 following sections contain the commission features of the bill. They provide for a commission to consist of five persons, whose term of office shall be for six years, except for the first appointments, which are to be for two, three, four, five and six years. The members of this commission are to be appointed by the President, by and with the advice and consent of the Senate. Their principal office shall be in Washington, but they may hold sessions at other places than Washington, and a single member of the commission may take testimony anywhere, as may be directed by the commission. These commissioners are to have salaries of \$7500 each. The commission has power to appoint a secretary, with an annual salary of \$3500, and has authority to employ and fix the compensation of such other employees as it may find necessary to the proper performance of its duties, subject to the approval of the secretary of the interior.

Section 22 provides that nothing contained in this Act shall abridge the remedies now existing at common law or by the statute.

Section 23 appropriates \$100,000 for the purposes of this Act for the fiscal year ending June 30, 1888.

Section 24 provides that the provisions of Sections 11 and 18 of this Act, relating to the appointment and organization of the commission herein provided for, shall take effect immediately, and the remaining provisions of this Act shall take effect 60 days after its passage.

SAN JUAN REGION, COLORADO.—Concerning San Juan, the *Silverton Democrat*, in an excellent review of the situation in its region, says: The quantity of ore shipped from the Silverton depot during the year commencing January 1 and ending December 31, 1886, foots up the comfortable amount of 14,350 tons, whose cash value is \$1,517,550. These figures are as correct as it is possible to get them, having been taken directly from the books of the Stoiber Bros., those of Schnyler & Duyckinck, ore samplers of Silverton, and the books of the Denver & Rio Grande Railroad Co. This is an increase on the output of 1885, notwithstanding the low prices for silver that prevailed during the best business portion of the year. Of all the mines and prospects in the San Juan country, subsidiary to the Silverton market, the output from 18 make up the great bulk of ore shipped during the year. These are the great mines of the district, whose prosperity and permanence are beyond question. The ore of some of these mines is both abundant and high in grade, while in others the grade is quite low, the margin over and above cost of mining, transportation and reduction of each ton being small, the sum of the proceeds being made by large output and the careful and economical management of the mines. Of the other mines that have contributed to the yield of the district, the number is 88.

THE ALICE.—During the past year the Alice company has paid four quarterly dividends of 6 1/2 cents per share of \$25,000 each, aggregating \$100,000 and making the total amount of dividends declared to date \$775,000. The stock is capitalized at \$10,000,000, divided into 400,000 shares of \$25 each. Each share has thus paid \$1.63 1/2 per share, while the plant and property are constantly improving. For the past five years the two mills have treated an average of 35,000 tons of ore per annum, a total during that period of 175,000 tons. In the Alice properties it is estimated that two tons of waste are displaced to one ton of ore. In the five years during which the two mills have been running, therefore, 350,000 tons of waste have been heisted, which added to the ore makes the tremendous aggregate of 525,000 tons of rock that the company has mined or lifted from the Alice and Magna Charta mines. During that time the gold and silver value of the bullion the mills have yielded exclusively from company ore has reached the splendid total of upward of \$6,000,000—enough to pay \$60 each to every man, woman and child in Montana.—*Butte Inter-Mountain.*

THE GRANITE MOUNTAIN MINE.—The ore is a very hard quartz, carrying native and ruby silver and black sulphurets of silver, together with oxide of manganese, antimony, zinc and arsenic. It is treated by dry crushing, chlorination and amalgamation, the milling appliances and method of reduction being very perfect. For the year ended August the average value of the ore treated, according to battery assays, was 177 ounces per ton—a much higher average than that of any other on the continent. For the past year the company has had but 30 stamps in operation, but so rich have been the developments of the past 12 months that a contract was let last summer for the construction of a new mill of 40-stamp capacity, which has just been completed. With 70 stamps dropping, it is designed to treat some of the lower grade of ore of which many thousand tons are blocked out and reserved in the upper workings, and which it is expected will reduce the average battery assays to \$125 per ton; yet it is anticipated by the directory that the gross output will be increased to \$240,000 of silver and \$2500 in gold per month, of which sum the enormous amount of fully \$200,000 will be passed to the dividend or surplus fund.

Gov. STANFORD has purchased the Grogan ranch at Paicines for his stock now at Palo Alto.

TABLE OF CONTENTS.

EDITORIALS.—Saving Floured Quicksilver; The Tehachapi Loop, 89. Passing Events; The Arid Interior; Reduction Works; Silver Coinage; Carboniferous Fields, 99. The Mining Bureau; New Rotary Roasting Furnace; Foundry Notes, 93.

ILLUSTRATIONS.—The Loop in the Southern Pacific Railway at Tehachapi, Cal., 89. Arent's Improved Rotary Roasting Furnace, 98.

CORRESPONDENCE.—The Old Belt Mining District, Montana; Leaching Ores, 90.

MECHANICAL PROGRESS.—Welding by Electricity; Piston Packing; A Pendulum Churn; Malleable Iron Ore; Bending Iron or Steel Plates; The Boiler Inspector Bill; To Make a Flange Joint that Won't Leak; Loss of Heat in Gas-Engine; An Odorless Solder, 94.

SCIENTIFIC PROGRESS.—The Conservation of Force; Segregating Lightning from Heat; Instantaneous Photography; Production of Citric Acid; Measuring Thought Action; Chemical Reaction from Pressure; Improvement in Engine Pistons; How Thirsty Plants Get Water; Astronomy in Ancient China; Burmese States, 94.

ENGINEERING NOTES.—The Efficiency of Electric Motors; A Ten-inch Draught Steamboat; The Eads Ship Railway; The Harlem Ship Canal; Cable Road for San Jose, 95.

USEFUL INFORMATION.—Adulterated Camphor; Cigars and Men; Economy in Coal Fuel; To Prevent Screws from Rusting; An Effective Sofa Ornament; Mock Iron; "Featherbone"; Iron Bookbinding; To Polish Plate Glass; Leakage of Petroleum; An Incandescent Lamp; Roughing off Tools; To Demagnetize Steel; Floating Pumice Stone; The Screwdriver; The Oldest Picture in the World, 95.

GOOD HEALTH.—Second-Hand Air; Diphtheria; A Sunny Room a Poem; For Scalds, Burns, Etc.; Take a Moment's Rest; How Will He Learn; Neuralgic Ointment, 95.

MISCELLANEOUS.—The Big Patent Fight; Friendly Demonstration by Mechanics; Determined Mines, 90. Smelting in Colorado; Snake River Placers; Quicksilver; Interstate Commerce, 91.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 92-93.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, and Bullion Shipments, 100.

Passing Events.

The Legislature is discussing a great many hills of interest at present, among them, that relating to the appropriation for the State Mining Bureau, to which we refer more fully in another column.

The rainstorm that set in on Thursday night is probably extending over a large area. The rainfall, up to the time of our going to press, has been copious, with prospects of several days' continuance, the wind and barometric indications being favorable.

The experiments to which we refer elsewhere concerning the saving of floured quicksilver are of great interest to miners. We are promised full details of the results of the practical trials, which will soon be made.

There are rumors that the famous Spring Valley mine at Cherokee, Butte county, is in financial difficulties and that it will be closed.

The Mount Diablo gold mines, Contra Costa county, about which there was some excitement a few weeks since, have not panned out very well. Some claims were located, but there is little evidence of any paying ore. Many will remember that there was a copper excitement in the same region a long time ago, when several thousand dollars were lost in the vain efforts to make a mine.

The Arid Interior.

The last issue of the MINING AND SCIENTIFIC PRESS contained our usual Annual Mining Review, a paper of 25 columns, embracing a summary of the progress made in the various branches of mining carried on in our Pacific States and Territories. More than two-thirds of this review related to a region that only a few years since was designated on all the maps extant as the "Great American Desert," and which, in a general way, may be said to cover the present Territories of Idaho, Utah and Arizona, that section of Washington and Oregon lying east of the Cascade Range, trans-Sierra and South-eastern California, together with the western half of Montana, Wyoming, Colorado and New Mexico; this region, in the absence of any easily recognized natural boundaries or climatic differences, taking in as much more territory as the imagination of the geographer might choose to include within its limits. In a rough way, it may be said to be bounded by British America on the north, Mexico on the south, the Rocky mountains and the Sierra Madre on the east and the Cascade and the Sierra Nevada ranges on the west. In its most restricted sense this so-called American Desert is, however, marked by very respectable dimensions, being more than ten times as large as all New England and nearly three times as large as the State of California.

Not much was known concerning this great interior basin until about 30 years since, when the California miners in search of the precious metals first visited and began its exploration. Meeting with the objects of their search in many parts of it, this extensive country began to be rapidly populated, the labors of the miners having since been rewarded with such success that more than half the gold and silver, with a large proportion of the lead and copper now produced in the United States, comes from this region. But these industries here are still in their infancy. That the present product of these metals will in the course of the next 10 years be doubled seems probable, some of them having last year increased their output 20 per cent over the largest ever before made. While the area of the metalliferous domain is under more vigorous and well-directed exploration, being all the while enlarged, the ores are at the same time being worked more closely and cheaply, imparting to the future of the mining industry here a very cheerful aspect.

But not only in mineral wealth does this supposed land of sterility turn out to be rich; it shows itself to possess also great agricultural and grazing resources. Much of it is well adapted for farming and stock-raising purposes. It contains more than 1,000,000 head of horses and neat cattle, with sheep and swine in countless numbers, vast herds of these animals being every year slaughtered or driven out of the country. Nearly enough fruit and breadstuffs are raised for home consumption, and of both there will be ultimately some, and perhaps much, to spare. The soil almost everywhere is warm and rich, growing the natural grasses and other stock-sustaining herbage in abundance. Sure and bountiful crops of the cereals can be raised here with the aid of irrigation, and in some places without this aid.

With these many forms of natural wealth so abounding, the name *desert* has come to be generally dropped in speaking of this region. The United States Geological Survey and other explorers in the service of the Government term these the Arid Sands of the Interior, and this is the proper term to apply to them; they are deficient in moisture but not generally in fertility.

But while the rainfall here is limited, averaging hardly more than three or four inches per year, the snow falls every winter to a great depth on the mountains that traverse this arid realm in every direction, the trend of the main chains being northerly and southerly. Between these mountains occur deep, broad valleys, some of which spread out into wide-extended plains. The filling up of these valleys, consisting of the material brought down from the adjacent mountains, is so loose and porous that the snow when it melts is absorbed by the soil, or, sinking to bedrock, flows out into the center of the valley, but little ever coming quite to the surface. In the winter, shallow lakes are often formed at the points of greatest depression in these valleys, but they disappear in most instances as the dry season

advances. By reason of these conditions water can be obtained in these valleys and plains almost everywhere by artesian boring, and that generally at no great depth. Hence, while there is not much water on or quite near the surface in this region, and most of the mountain streams dry up early in the summer, it will, by recourses to deep-well digging and boring, be possible to obtain here water enough for a large amount of stock, as well as for extensive irrigation. This, while it will in large measure insure the prosperity of the farming and cattle interest, will also serve to largely promote mining, a great deal of the ore being carried from the mines down into the valleys for reduction. More than half of the ore extracted from the Utah mines is treated at the several large smelters located in this valley of the Jordan.

Thus it will come to pass that all the leading industries of this immense basin will be rapidly advanced notwithstanding its scanty rainfall. For the output of the mines an annual increment of ten million dollars for some years to come may be safely counted upon. That a similar growth in the other forms of wealth, as well as in population, will follow, may also be set down as likely to ensue. Meantime the term "Great American Desert" having been eliminated from the maps, will cease to have "a local habitation and a name."

Foundry Notes.

The new North Star mill, Nevada county, built by the Risdon Iron Works, will be started up shortly, and, it is said, will be one of the most complete gold mills in the State. The whole mill is to be run by water-power. This water is first used by the Empire mine, and is carried from there by 10,000 feet of iron pipe. The Risdon Works have also been putting up some machinery in a mine at Angels, Calaveras county.

The Union Iron Works are still engaged in the temporary erection of the great iron dome for the Lick Observatory. Mr. Irving M. Scott has returned from the East and will vigorously prosecute the work on the cruiser Charleston. These works hid lowest on Cruiser No. 1; also on No. 2, but the first was withdrawn. The telegraph this week announces that the contract on Cruiser No. 1 will be re-advertised. The Union Works may get this after all. On another page we give Mr. Scott's speech to the workmen who welcomed him home. Our space last week having been fully occupied by our annual mining review, we were compelled to leave the account over until this issue.

The Pacific Iron Works have just completed shipment of a 10-stamp silver mill for the Mt. Diablo Company, of Esmeralda county, Nevada, embracing chloridizing furnace, pans, settlers, etc. They have also in hand a 20-stamp mill for the La Luz Mining Co., of Guanajuato, Mexico. This mill will be furnished with three 75-horse power Hazelton hoilers, which these works are introducing so successfully on this coast. Also a 50-ton chloridizing furnace for the Manhattan Company, of Austin, Nevada; water-pipes, gates, etc., for the Walnut Grove Water Company, of Arizona; tramway for the Standard Mining Co., of New Mexico. They are sending several Duncan concentrators to various parts of the country, including two shipments to South America.

Silver Coinage.

As far as the miners of this coast are concerned, the silver question is the most important matter that Congress has to deal with. Unfortunately it has got into "politics" more or less, and there are now so many branches of the subject that there are very few who understand it. The most recent action concerning the question in Congress is the answer of the Director of the Mint to the House resolution relating to silver coinage, which was this week transmitted to the Speaker by the Secretary of the Treasury. The director presents a table from which it appears that the cost of the amount of bullion delivered on monthly purchases during the past fiscal year was \$24,398,002, and the face value of the coinage was \$29,838,905. During the first six months of the current fiscal year, the cost of monthly purchases of bullion was \$13,548,403, and the coinage was \$15,960,361. In only one month (July 1885) did the coinage fall below \$2,000,000. In

that month the total cost of purchases delivered was \$1,578,874, from which the coinage was \$1,900,000. The director says that it will be seen from this table that the law has been complied with during the past fiscal year as well as for the remaining months of the calendar year of 1886.

Carboniferous Fields.

Coal on the Pacific Slope.

Since Americans have been living in California, more or less interest has been felt in the discovery of coal in this State; prospectors have wandered far and wide, but as yet little success has rewarded their search. On the western slopes of the Sierra Nevada, occasional deposits of brown inferior lignite have been found, notably at Ions, and carboniferous traces have been discovered here and there in the Coast Range. One important seam, and one only, has been mined to any extent, and that at Mount Diablo; but this deposit is poor in quality, when compared with the coals of Pennsylvania. Indeed, the statement of geologists would seem to have weight that California was upheaved from the ocean at a later period than the great carboniferous age, and that its strata are of too recent origin to be coal-bearing. If these scientists are right, there is little or no hope of finding coal here.

The Pacific Coast, however, geologically increases in age toward the north, and valuable discoveries have been made in Washington Territory and above. The history of these discoveries is given by Mr. H. H. Bancroft in his volume on British Columbia. In 1835, a party of Quakwolds Indians, from the north end of Vancouver island, came for the purpose of trade to Fort McLoughlin, a station of the Hudson's Bay Company. Full of curiosity, they wandered, one day, into the blacksmith shop, where they watched the smith draw his glowing iron from the fire and shape it, with sturdy blows, on the anvil. Presently they saw him replenish his fire with a black, lustrous, rock-like substance; and as they saw with astonishment that it glowed and burned, they crowded eagerly around the furnace. They turned to the pile on the ground, picked up the lumps, turned them round and round, broke them, hit them, and finally threw them down with a questioning grunt. "What is that?" they demanded. "Stuff to make the fire burn," replied the smith, good-naturedly. "What do you call it?" "Coal." "How is it made?" "It is dug out of the ground," and the smith told them that the coal was brought in vessels from England, a country a long way off.

Drawing off into a clump as the show-ers of sparks began to fly from the anvil, the Indians fell to talking and gesticulating among themselves. They finally seemed to come to an understanding, and then burst into wild laughter. Turning to the coal again, they examined it thoroughly, and finally told the smith that though the white man was wise in many things they were fools to bring from a great distance a substance that could be found at their doors, and that in their country the same substance could be found in many places.

Word was sent to Fort Vancouver, and in due time McLoughlin, the chief trader, ordered the company's steamer Beaver to stop at the place indicated by the Quakwolds and ascertain the truth in regard to their report. The vessel stopped, and the crew went ashore to make the search. By distributing a few presents among the natives they soon learned where the deposits were. Indeed the coal beds were visible from the beach, where for about a mile the waves had washed away the soil and left the seams exposed. At another place a rivulet had cut its bed through the strata for three-quarters of a mile back from the shore. The coal was found to lie in extensive fields and in clumpy mounds.

A few men were employed by the Hudson's Bay Company in developing this deposit, but through lack of proper implements progress was slow. The surface coal was of inferior quality, suitable for steam purposes, but useless for the blacksmith; the substrata, however, was of better quality. The works were extended, and improvements were made, till, in 1849, a force of 40 men—whites, half-breeds and Kanakas—were landed, and a regular post, Fort Rupert, with storehouses, workshops, and officers' quarters, was established there. Thorough investigation,

however, showed that the coal seams there were not profitable to work.

The coal deposits at Nanaimo were also discovered by the aid of an Indian. He, too, noticed coal in use by the blacksmith at Fort Victoria, where he was having his gun repaired, one winter's day in 1849. This old Nanaimo chief said that he knew of beds in his own country, and was told that he could have his gun repaired without charge and a bottle of rum also if he would bring in some specimens. The old chief departed, and nothing more was heard of him for some months. He was old and feeble, and during the long winter he lay sick, almost at death's door. With returning spring, however, his strength revived, and the old man began his work, determined to earn his bottle of rum. One day, early in April, he paddled into Victoria harbor with his canoe loaded with coal. It was taken at once to the forge, examined, and tested by the smith, and was pronounced to be of excellent quality. The savage received his well-earned rum.

A prospecting party was fitted out at once by Joseph W. McKay, and they landed near where the town of Nanaimo now stands, about May 1, 1850. They carefully examined the country for miles around, and on the 8th of May McKay located the Douglas vein, which is still being worked. At Commercial inlet was a seam, three and a half feet thick; but the average thickness proved to be about double this.

On the northwestern extremity of Nanaimo harbor a shaft was sunk by experienced miners, and a thickness of six or seven feet of coal was found. In 1852 work began in earnest here; the fur company erected the necessary buildings and established Fort Nanaimo, and the development of the mines was commenced with great vigor. The first cargo of coal sent to San Francisco was by the ship William, and it brought there \$28 a ton. Work has been carried on continuously in these fields up to the present time, and through this industry Nanaimo has developed into a busy, incorporated town. The area of the coal fields here has been estimated to be 90 square miles.

In 1852 or 1853 coal was discovered at Bel-lingham bay by two woodchoppers, who found coal in a mass of earth, clinging to the upturned roots of a fallen tree. They examined the ground beneath and found a seam several feet thick; a claim was entered, which afterward was sold for \$10,000 at San Francisco. Several companies were organized to work this and adjoining claims, of which the most prominent were the Puget Sound Mining Company and the Mamoose Mine Company.

Anthracite coal has been discovered in the Queen Charlotte islands, and the seams have been found to be of considerable extent and value. A company, taking its name from these islands, established extensive houses, tramways, inclines and a wharf at Cowgitz, to mine this coal. Anthracite has also been found at Cumshewa harbor, and at Masset, in the northern end of the islands.

Coal has been discovered on Baynes sound, and in the vicinity, which is pronounced superior to that of Nanaimo, but the harbor facilities are much inferior. Five thousand acres of coal lands are owned by the Baynes Sound Colliery Company, Limited, which began operations ten miles southeast of Comox, in 1876. By the end of the following year a narrow-gauge tramway, running from the mine $3\frac{1}{2}$ miles, to tide-water, had been constructed, and a locomotive and cars procured. A wharf, with two chutes, was built, and a town was laid out, named Quadra.

By the act of the Legislative Assembly April 18, 1877, the coal mines of British Columbia were placed under stringent and healthful regulations. By this act women and girls are not allowed to work in the mines underground, nor boys under 12. If, on account of the thinness of a seam or from any other cause a boy under 14 is employed, he shall not work more than five days, of six hours each, in any one week. Wages must not be paid in a liquor saloon, and if payment is made on the amount of coal raised the check-weigher may be nominated by the miners. Examiners are appointed to examine and grant certificates of competency to managers, who are required to be experienced and temperate men.

The Mining Bureau.

The original bill introduced in the California Legislature appropriated \$125,000 to the support of the State Mining Bureau. The majority of the Committee on Mines and Mining agreed to report it for \$60,000, but the minority agree only to \$20,000, on the plea that "the purposes of the bill will not prove beneficial to the mining interest, and instead of stimulating mining will only deplete the treasury." The last Legislature appropriated \$20,000, and of this there is a balance of \$2500, as also an unexpended balance of \$2400 in the Mining Bureau fund, making in round figures \$5000 to the credit of the trustees. The minority believe that "no such sum as asked for is needed, nor that the Bureau is of any material value to the development of mining interests."

It is difficult to say exactly what the Legislatures of late years think will prove beneficial to the mining interest. This interest has had to take care of itself as best it could for some time. The only thing now asked is the support of this Bureau. The minority report referred to above says: "It is idle to hope for much results from asserting and displaying rocks in the richly furnished parlors of the Mining Bureau." But if the trustees and mineralogist have no money for anything else they must confine themselves to the mere task of collecting

tion referred to, rather than collecting minerals. However, it was determined by the official appointed that a collection of minerals was the most important, and the Bureau became more prominent in that direction than others. This was considered a mistake by many friends of the Bureau who urged the collection of data concerning the working of mines, pumping, hoisting, treating ores, etc.

It is now seen that this information is needed and desired, and must be obtained if the Bureau is to be a permanency. Meantime, however, the ore and mineral collection has grown to be large and of great value, and its care is expensive, by reason of the space required to display it. It fills a sphere of usefulness in that it conveys to strangers and visitors an idea of the magnitude of our mineral resources. But a small appropriation will only maintain this feature. It will not permit the Trustees and State Mineralogist to carry out the plans they have formulated. They realize fully that the data needed will not be forwarded to them. They must send out competent men to collate the facts, and then publish. There is now no official source of information concerning these matters. Each miner or millman goes on in a haphazard way, without any means of finding out what others have done in the same direction. With data which would be collected in a year or two, this would not be the case.

ARENTS' IMPROVED ROTARY ROASTING FURNACE.

minerals. It may be confessed that too much attention has been given to this branch and too much money spent on it in the past, and it may be confessed also that collecting minerals is not the very best way to advance the mining industry. This is realized by the present incumbent in the office of State Mineralogist, and it is with the idea of extending work to the field that the increased appropriation is asked.

The writer conversed with the trustees and mineralogist on this subject some months since. There is an evident desire on their part to make the Bureau of more practical service to the mining industry than has been the case before. They want to send suitable men to the various gold mills in the State and collect data concerning the best practices. They want to find out the best weight and drop of stamps, best systems of amalgamation and saving fine gold, plans of utilizing and applying water-power, etc. It is desired to gather all this data and publish it for the benefit of the mining community.

There is no doubt that all this should have been done by this institution long since. The MINING AND SCIENTIFIC PRESS advocated this in the early days of the Bureau. The late Joseph Wassen, who originated the bill creating this State institution, was in favor of this plan also. In fact, he never intended it to be a mere collection of ores and minerals, well enough in their way for purposes of study and comparison by students, but of little use for advancing mining development or the mining industry. When George C. Perkins, as Governor, signed the bill, he also, as a miner owner, was in favor of the Bureau collecting the informa-

tion referred to, rather than collecting minerals. However, it was determined by the official appointed that a collection of minerals was the most important, and the Bureau became more prominent in that direction than others. This was considered a mistake by many friends of the Bureau who urged the collection of data concerning the working of mines, pumping, hoisting, treating ores, etc.

Reduction Works.

The Rano reduction works, which we described fully not long since, have been in full working order some weeks and a few days since made their first shipment of hullion. A smelter is being erected and will be in operation in about two weeks. The ore is said to be coming in as fast as two such works could use it.

Works of this character are just what are needed at central points in other States and Territories. There are many small districts and camps where there are ore-producing mines, but where there are no means of beneficiating the ores. Moreover, the presence of reduction works in any vicinity stimulates prospecting and mining. When the miners know to a certainty that they can dispose of their ores, or can have them worked, they are encouraged to go on with prospecting or development. There are many towns where the merchants and business men themselves could afford to put up works for treating ore. Such things attract a mining population and enliven the whole neighbor-

hood. The success of the Rano reduction works was assured from the beginning, as there was plenty of ore promised to begin with. It is hoped the example set there will be more generally followed elsewhere.

New Rotary Roasting Furnace.

It is a well-known fact that the intensity of the temperature of heated gases, coming from a fireplace and passing through any space of more or less extent, diminishes gradually as the gases pass on, the intensity of temperature being greatest nearest the fireplace or entrance and smallest near the flue or exit. It is also a fact that in ordinary roasting furnaces the layer of ore in the roasting chamber is of equal depth from one end to the other, practically speaking; hence with a flame of varying temperature, as it passes through the roasting chamber, the ore is usually overheated at one end, near the fireplace, while it remains "underdone" or insufficiently heated and roasted at the other end near the flue.

Mr. Albert Arents, of Alameda, has devised certain improvements which obviate this drawback entirely, or at least to a great extent, for by it he secures a layer of ore through the length of the roasting chamber or "hearth" of graduating thickness or depth, in conformity with the varying or graduating intensity of temperature of the gases passing through it—that is to say, where the greatest heat is, the layer of ore is deepest, and vice versa.

He makes the diameter of the roasting chamber or cylinder, gradually decreasing from the end nearest the flue. When such a furnace or roasting chamber is charged with pulp or crushed ore, and the chamber is rotated around its horizontal axis, the material seeks a level and its surface soon lies parallel with the horizontal axis of the chamber; hence it is necessarily thickest or deepest toward the greatest diameter of the chamber, graduating the thickness or depth toward the smallest diameter of the opposite end, at or near which the layer of material is thinnest or most shallow. If, now, the chamber is continued to rotate, the pulp changes its surface, continually falling or tumbling sideways, keeping its place in reference to the length of the chamber; and if a flame is passed through this chamber from the widest toward the smallest end, said flame finds more pulp to heat where itself it is hottest, and correspondingly less where it is coolest.

In the accompanying engraving *A* is the fireplace; *b* its ash-pit; *c* is the roasting chamber, in the form of the frustum of a cone; *d* is the flue through which the products of combustion escape into any suitable series of dust chambers and chimney; *e* is a sheet-iron hopper, receiving the charge of ore, prior to its introduction into the roasting chamber; *f* is a bin of masonry, located underneath the fireplace, and receiving the roasted ore when discharging of the chamber takes place; *g* is a sliding-door of cast iron, through which the ore is removed to the cooling-floor; *i*, after it has remained in the bin for several hours, and has gone through what is termed "banking;" *h* is the fireman's floor; *k* is the sheet-iron extension of the bin, *f*, in the form of a removable funnel; *l* are friction rollers upon which the chamber is mounted and revolved; *m* are cast-iron rings, tires or bands of equal exterior, but unequal interior diameter, fastened to the roasting chamber and receiving their motion through friction on the driven rollers; *n* is the gearing, transmitting power to the rollers; *o* and *p* are openings, serving respectively for charging and discharging the ore, which are closed at proper times by cast-iron hinged goods, usually applied for charging and discharging this class of furnaces.

The difference between the largest and smallest diameter of the roasting chamber proper is from 12 to 18 inches, according to the length of flame any local fuel may give. The larger the flame, the less difference should be in the two diameters; the shorter the said flame, the greater should be this difference. The roasting chamber consists of a heavy sheet-iron shell, and is lined with four inches of common fire-brick or any suitable lining. Rollers and support rings are made of chilled cast iron.

THE Milton Mining and Water Company has been adjudged in contempt for ground-slucing and hedrock cleaning, by which certain materials described in the decree of injunction have been discharged into the river from the mine at French Corral.

THE new 40 stamp mill of the Granite Mount ain mine, Phillipsburg, Montana, has been started up.

MECHANICAL PROGRESS.

Welding by Electricity.

Prof. Thomson recently lectured before the Society of Arts connected with the Boston Institute of Technology, on this new discovery in electricity. He alluded to its wonderful expansion in the field of usefulness during the last 15 years. Heating by electricity is now practicable when the supply of heat waste is small, or when simply quick heating, or very high heating for a short time, is necessary. Upon this depends its use in welding. Up to the present the process of welding has been confined within narrow limits, the metals upon which it could be practiced being few. By the new method, a broken bar of metal can be easily reunited, or bars of different metals welded together; and those metals which previously resisted welding most strenuously are now joined with ease, while those previously easily welded remain the same by the new process. Differences in specific electrical and heat conductivity are the properties which are most troublesome. The method consists in simply forcing the ends to be welded together tightly and passing a sufficiently powerful current of electricity through the joint. The resistance raises the metal to a welding heat, and the pressure makes the joint.

The speaker next enumerated some of the practical results obtained personally within a recent period. Iron and copper wires of varying dimensions have been joined end to end. Steel or iron bars nearly an inch in diameter have been solidly welded together, and steel has also been joined to brass. A copper rod nearly one-half an inch in diameter has been welded, requiring a current of 20,000 amperes. Specimens were shown of the results of the above-mentioned weldings, and of many others recently made. Steel-pointed tools may be cheaply made of inferior metal, and new points welded on as desired.

The cost of the new process is undoubtedly less than by the old method of forge and hammer, while the time required is very short, and no heat is wasted. After explaining clearly the meaning of the terms volt and ampere, Prof. Thomson stated that in welding a steel bar $1\frac{1}{2}$ inches in diameter, a current of 6000 amperes in volume, and having an electro-motive force of one-half a volt, was necessary. The use of 35-horse power for one minute is another way to state it.

The chief essentials of the apparatus are the means of getting a heavy current through the metal without loss. Carefully adjusted clamps hold the pieces to be welded in a true position, end to end, and by means of a cam their distance apart can be brought to a minimum. A secondary battery, or, preferably, an inductive coil, is used to obtain the enormous current. The shortest possible connection is made to the clamps, which are of brass and solidly constructed. The pieces to be welded are polished bright and placed in the clamps, touching end to end. The current passing through renders the metal molten, and springs in the clamps keep the contact forcible. The weld is probably simply the result of heat and pressure, and electricity plays no part beyond the heating. Should the heating be unequal on the section, by a simple law the rise of temperature becomes uniform, as cold metal is a better conductor, and more electricity thus passing raises to the average temperature of the colder part. All the apparatus was exhibited in working order, and many successful welds were made in a remarkably short time and the results critically tested. The apparatus and methods are fully covered by patents and can, of course, be used only by permission of the inventor, Prof. Thomson.

PISTON PACKING.—Relative to the discussion of the question, "What is the best form of packing for piston heads and stuffing-boxes?" which was presented at a recent meeting of the Western Railway Club, it may not be amiss to direct some attention to this average character of piston and valve rods and spindles. As a matter of fact, it is not unusual to find such rods, even when new, in a remarkably poor condition. Not only are they often turned out of the shops indifferently finished, but in the subsequent work of fitting and erecting they are handled in a manner which would leave little to remain of the most carefully turned and highly polished surface. It can scarcely be said that any care is taken of these rods when an engine is being put together, and whatever work may have been expended on them to furnish them in the best possible condition is frequently wholly wasted. It is not surprising, under the circumstances, that in the end stuffing-boxes and packings of every description fail to keep them tight, and that they prove to be sources of constant expense and troublesome delays. The idea which unfortunately prevails to some extent, that a valve or piston-rod will and should work itself smooth in a stuffing-box, is responsible for a good deal of this carelessness and should be vigorously dispelled.

A PENDULUM CHURN.—The latest novelty in churns is one which works on the principle of the pendulum. The churn is hung up and by devices of counterbalance weights and springs is moved back and forth like the weight on a clock pendulum, by the exercise of a very little force. The construction is very simple; there is no iron or metal of any kind to be brought into contact with the cream, thereby avoiding

any collection of corrosive matter; it can be readily taken apart for cleansing and cannot get out of repair. The evenness with which it brings the butter gives, it is claimed, a larger percentage from the same amount of cream than other churns. A small as well as a large amount can be churned and the churn is made of different sizes. A small child can operate a large churn.

Malleable Iron Ore.

McRae, in his "Products and Resources of Arkansas," says that altogether the most remarkable and interesting mineral of all that region is the white, malleable iron ore, regarding the existence and malleability of which a great deal of skepticism is said to exist. It is found in the corner of Howard county, adjoining the frontier of Montgomery, Polk and Pike. During the war, it is stated on good authority, the inhabitants of the vicinity used to take the ore as it was picked up from the ground, and, in an ordinary blacksmith forge, hammer it into horseshoe nails. Whether this is true or not, it is certain, and can be abundantly proved, that the ore can be taken and, being heated in an ordinary blacksmith forge, can be welded and beaten into any desired shape. It should be remembered that this white iron ore has been analyzed more than once. Mr. Charles E. Wait, of the Missouri School of Mines, makes the following quantitative analysis:

Water.....	9.94
Silica.....	16.27
Ferric oxide.....	69.69
Ferrous oxide.....	1.03
Alumina.....	2.55
Sulphur.....	.03
Phosphoric acid.....	trace.
Total.....	99.51

The outcrop of this ore, as far as it has been explored, runs for two miles west to east, showing a width of from 15 to 30 feet, with an unknown depth. There can be no doubt that this development of iron, in so pure and malleable a form, will some day be immensely valuable. The magic touch of a railroad will convert it into gold.

BENDING IRON OR STEEL PLATES.—An invention of Mr. Joseph Toward Eltringham, of South Shields, England, relates especially to the bending of the shell plates of marine boilers of great thickness—required for high working pressure—without the use of rolls, dispensing with the heating of the plate, which frequently injures the quality of the material, and insuring that the plate shall be bent to a true radius over its entire surface, which is not effected by roll bending. The operation of bending, according to this invention, is effected by concave and convex molds of the required radius, each application of which bends a portion of the plate equal circumferentially to the breadth of the molds and axially or longitudinally to their length, which will be sufficient to take in the largest plates required to be dealt with. The machine may be arranged to operate either vertically or horizontally, as may best suit special conditions, but in either case it is perfectly self-contained, requiring no further foundation or steadiment than is necessary to support its own weight and that of the plate being bent. The plate may be moved forward as each section is completed upon rollers and the use of the crane dispensed with except to bring it to the machine in the first instance, and to remove it when completed. The machine may be adapted for corrugating—simultaneously with the bending or not—plates forming any arc of a circle by using corrugated molds, the operation being the same, and the plate may be heated or not as may be required.

THE BOILER INSPECTOR BILL.—The Senate committee has been discussing Senator McCarthy's bill, which provides for the appointment of steam boiler inspectors. By its passage six boiler inspectors would be appointed—one for each congressional district. A large number of persons were present. President McEvoy, of the Pacific Boilermakers' Association, was the principal witness. Messrs. Baker & Hamilton also visited the town on that account. The San Francisco representatives are willing for the bill to pass, but there is a strong opposition to it among the country members. They hold that in the interior the boiler inspector would have every farmer who has an engine at his mercy, and the place would engender blackmail. Farmers with immediate need for harvesting would have to sue for mercy at the hands of one man.

TO MAKE A FLANGE JOINT THAT WON'T LEAK.—To make a flange joint that won't leak nor burn out, on steam-pipes, mix two parts of white lead to one part red lead, to a stiff putty; spread on one flange evenly, and cut a liner of gauze wire—like mosquito-net wire—and lay on to the putty, of course cutting out the proper holes; then bring the flanges "fair," put in the bolts and turn the nuts on evenly. For a permanent joint this is A 1.

LOSS OF HEAT IN GAS-ENGINE.—Experiment has shown that when an explosive mixture is burnt in a cylinder of a gas-engine, very nearly half the total heat developed by the gas is lost by coming in contact with the wall of the cylinder.

AN ODORLESS SOLDER.—A soldering fluid composed of a teaspoonful of chloride of zinc dissolved in two ounces of alcohol will not rust and tarnish and has no bad smell.

SCIENTIFIC PROGRESS.

The Conservation of Force.

The subject taken by Mr. R. Howson, the president of the Cleveland Institution of Engineers, for his inaugural address, at the meeting of the Institution on Nov. 22d, was "The Conservation of Force and Some of its Possibilities." The author explained that all the natural powers which were employed depended upon the development of potent or static energy into the energy of motion. When that motion had been utilized, this energy was lost, and could not be recovered except by a renewal of its source. The principle was traced in the case of falling water, the steam engine, in voltaic electricity, and in the dynamics of animal life, and it was shown that in every instance the force developed and used up represented so much waste of original power, which waste would have to be made good, otherwise the system would come to an end. The balance was invariable, so far as could be ascertained in our laboratories and workshops.

Nevertheless, it was contended that outside our terrestrial sphere, the conditions were different, and therefore the results would be different. In one case it was pointed out that we actually know this to be true, viz., that the principle of gravitation, which brings everything to a standstill here, is, in the planetary system, one of the components of two forces which are the cause of unceasing orbital motion.

After referring to permanent magnetism as in some respects falling into the same category as magnetism, the president entered into some speculations as to other cosmic possibilities which might be true, although, owing to our environment, these possibilities could not be realized here. Among those was the question of the radiation of the sun, whether that was really in process of decay or not. The doctrine of the dissipation of energy leads to the appalling result that the universe must ultimately come to one dead level of coldness, darkness, and desolation. The author contended that this doctrine might not after all be true, but that there was a law of compensation coexistent with the process of radiation.

SEOREATING LIGHTNING FROM HEAT.—When anything becomes heated, says an exchange, it has received with the caloric a portion of electricity, and if, by any means, the caloric can be abstracted, the electricity should remain. Take a bell-glass and heat anything, such as sand, flour, meal, iron filings, copper filings—in fact, any substance in the form of a powder, and dust it into this glass on any cold morning when the thermometer is in the vicinity of zero, and the glass will at once become strongly electrified. To get the best results, the cold should be so intense as to immediately abstract the caloric, which passes through the glass into space without warming the glass, in this respect resembling sun-heat. The glass, however, being a non-conductor, the electricity remains imprisoned. Air, when heated, also requires a large supply of electricity, even more than aqueous vapor. Hence air becomes highly charged with electricity occasionally when no vapor is present. For experiment, take a pig's bladder and partly fill it with dry air. Heat this until it expands. Carry the bladder out of doors and pass the hot air in it into another bladder, through a rubber tube, and the air, when it enters the cold bladder, becomes electrified. Next hold the mouth of this bell-glass downward and press the hot air out of the bladder into it, and the bell-glass will become electrified. There are hundreds of other ways by which one can prove that when a thing is heated it also receives electricity. To perform the above experiments successfully, the cold employed should be below the freezing point, at least, and as much lower as convenient.

INSTANTANEOUS PHOTOGRAPHY.—Mr. Mallin, a photographic artist, of Southport, England, has recently been very successful in taking instantaneous photographs of flying gulls. Animals in far more rapid movement have been photographed by Mr. Muybridge in America, or M. Marey in France; but these are produced by special apparatus, and rarely give much more than a silhouette of the object photographed. The photographs of the gulls were taken by Mr. Mallin under ordinary conditions, and with ordinary apparatus; but the lens must have been a good one, and a very rapid shutter must have been employed. The plate also must have been of special high sensitiveness. About 60 birds are shown quite sharply and distinctly, and their various attitudes are curious. Most of them have the wings spread in the orthodox manner, but some of them are caught in the position with the wings hanging down, which, from the shortness of the time during which it is maintained, the eye does not appear to catch. The photographs are striking examples of the speed with which objects can now be thus reproduced.

PRODUCTION OF CITRIC ACID.—Chemists have lately been much interested in the discovery that large quantities of citric acid may be extracted from the fruit of the cranberry, which, it appears, contains one and a half to one and three-fourths per cent of pure acid, and accompanied by one-fourth to one-third per cent of malic acid; but the quantity of the latter is found to vary in different localities, and it di-

minishes as the fruit becomes perfectly ripe. In this process the fruit is ground in a mill and pressed to obtain the juice, the residue being treated with water, subject to pressure three times more; the first operation yields 57 per cent of free acid. The liquids being all united, are treated with a solution of gelatine, which precipitates all the tannin; the precipitate is very abundant, but is soon deposited. Having ascertained by a test made upon a small portion of the clear liquid how much carbonates of lime is required to saturate it, this quantity is added to the whole of the solution decanted, not filtered, from this precipitate of tannate of gelatine; when the entire liquid is perfectly saturated it is heated until it boils; the boiling causes citrate of lime as white as snow to be deposited, and this being collected and strained in the usual manner, is decomposed by the action of sulphuric acid at 10 per cent. From one to one and a fourth per cent of pure crystallized citric acid can thus be obtained from the fruit of the cranberry.

MEASURING THOUGHT ACTION.—Starting with the idea that the hand varies considerably in size with the quantity of blood present in it at any moment, Prof. Morse, the Italian physiologist, has made some most interesting investigations. In his first experiments the hand was placed in a closed vessel of water, when the changes in the circulation produced by the slightest action of body or brain, the smallest thought or movement, was shown by a rise or fall in the liquid in the narrow neck of the vessel. With a large balance on which the horizontal human body may be poised, he has found that one's thoughts may be literally weighed, and that even dreams, or the effect of a slight sound during slumber, turn the blood to the brain sufficiently to cause the balance to fall at the head. When the brain of the person balanced is being relaxed from thought, the flow is toward the feet, with a corresponding oscillation. The investigator has continued his studies of the circulation until it seems that he may almost read one's thoughts and sensations. A single pulse-beat shows him whether a person is fasting or not; two beats serve to determine whether the subject is a thinking or a heedless one, whether asleep or awake, cold or warm, agitated or calm. The changing pulse even told him when a professional friend was reading Italian and when Greek, the greater effort for the latter having due effect on the blood flow.

CHEMICAL REACTION FROM PRESSURE.—It has lately been shown by experiment, that, by the simple action of pressure upon two solids, previously thoroughly intermingled in a pulverulent condition, a chemical reaction between the two is effected. The substances experimented upon were barium sulphate and sodium carbonate, about one gram of a mixture of these two substances being submitted to compression; the cylinder resulting being then pulverized and submitted to the action of water, and the insoluble residue analyzed to determine the amount of barium carbonate produced. It was found that by compression of the mixture, under a pressure of 6000 atmospheres for a few seconds only, nearly one per cent of the barium sulphate had been transformed into carbonate; and upon subjecting the material of the first cylinder anew to compression, four times in succession, the amount of the carbonate produced rose to 4.78 per cent and after six to 8.99 per cent. It is also ascertained that if these cylinders are left to themselves after compression, the chemical action will continue for a period of some 14 days, the quantity of barium carbonate produced in the cylinder submitted to six compressions rising during that time to 10.89 per cent.

IMPROVEMENT IN ENGINE PISTONS.—This invention consists in making the piston body with a suitable number of holes round its external surface, in which are placed a corresponding number of inverted spiral steel springs; within each spring is fitted a metal stud, having a tapered head, to open or expand the outside ring of the piston, so as to get the same steam tight all round the piston. The piston rings are correspondingly shaped to receive the tapered head of the studs, and the other end of the stud is placed and works in a recess made in the body, extending toward the center of the piston. Patents claim the construction of the piston as set forth, whereby a direct equal pressure is obtained both at the top and round its sides, in effect rendering it a double compensating piston, perfectly steam tight, and expanding both in diameter and horizontally.

HOW THIRSTY PLANTS GET WATER.—In the arid regions of Egypt a French botanist, M. Volken, has found roots 20 times as long as the part of the plant above the surface. On some of these desert plants the same observer has noticed a very curious moisture-absorbing contrivance. Glandular hairs put forth by the leaves yield a bitter crystalline liquid which spreads out at night and collects the dew.

ASTRONOMY IN ANCIENT CHINA.—One of the best evidences of the early study of astronomy by the Chinese is found in one of the Paris libraries. It consists of a Chinese chart of the heavens, made about 600 B. C. In this chart 1460 stars are correctly inserted, as corroborated by the observations of modern astronomers.

BURMESE SLATES.—A peculiar black pepper, made from the bark of certain trees, serves the purpose of slates in Siam and Burmah, the writing being erased by means of betel leaves.

ENGINEERING NOTES.

The Efficiency of Electric Motors.

A number of experiments, says *Engineering*, of London, have been made by Mr. W. M. Morley and Mr. C. Watson, at the factory of the Anglo-American Brush Electric Light Corporation, to find out the best principles on which to construct electric motors and the reason why the dynamo as a motor should have a lower efficiency than when working as a generator. As given in the *Philosophical Magazine*, these principles are: 1. That the magnetic field should be a very strong, and the armature a very weak, electro-magnet. 2. In both generators and motors, lead, distortion or displacement of the brushes or the magnetic field is wrong, and is to be avoided by attention to the first condition. If there be any lead in dynamos, it is in the direction of rotation; in motors it is in the opposite direction, as the course of the current through the armature is reversed, but the field is the same. 3. In both generators and motors absence of sparking at the brushes depends mainly on the first condition being complied with. 4. Reversal of rotation. In neither generators nor motors is movement of the brushes necessary.

It appeared from these principles of construction, which are applicable to both generators and motors, that the lower efficiency of the dynamo as a motor must be due either to friction at the bearings, air friction and friction of the brushes against the commutator; to loss of energy in heating the armature and field magnets and to self-induction; or to loss by the production of eddy currents in the iron. From the nature of these probable causes consideration shows that the last is the true one; for in a dynamo the rotation of the armature causes eddy currents to be generated in the iron core in the same direction as the conductor proper with which the core is surrounded. Of course as the armature is always more or less subdivided or laminated in a direction at right angles to the lines of force, any circulation of currents round the core is avoided; but local currents or "eddies" are set up, and taken as a whole these eddy currents on the outside of the core are in the same direction as the current flowing in the copper conductor. In an electric motor, however, the eddy currents and the currents in the copper conductor are in opposite directions, as, although the electro-motive force set up in the conductor is in the same direction in a motor as in a dynamo, the current in the former is forced through the armature in a direction contrary to the electro-motive force. It will be seen that while in a dynamo the two sets of currents, those in the iron and those in the conductor, tend to oppose and to reduce one another, in a motor they act in such a manner as to mutually assist one another. Thus, with the strength of field, the current in the conductor and the speed the same in both cases, the eddy currents in the iron core of the armature will be greater than in a generator, and the loss from heat more.

A TEN-INCH DRAUGHT STEAMBOAT.—A steamboat has been built to navigate the Allegheny river between Pittsburg and Kittanning, a distance of 45 miles. Although 142 feet long and 25 feet beam, she draws but 10 inches of water. It has been nearly or quite 20 years since steamboat packets ran on the Allegheny, and it has been believed that the railroads had crowded them off for all time; but the builder of the craft mentioned believes that there is still a chance for a line of properly constructed boats, and, if this first venture pays, we believe he intends to add other boats, and perhaps run some of them as far up as Oil City. There must be many streams navigable for steamers of light draught like the above.

THE EADS SHIP RAILWAY.—Captain Eads has kept so quiet lately concerning his project of building a ship railway across the isthmus of Tehuantepec that some people might suppose he had abandoned it. Not so. He had little confidence, however, of obtaining any assistance from Congress further than securing a charter for the road, which being done, he thinks there will be no difficulty in obtaining money to construct it from great capitalists of this country and Europe.

THE HARLEM SHIP CANAL.—Charles Stoughton, of New York, who will ask Congress for \$1,500,000 to complete the Harlem ship canal, urges upon citizens of Chicago that that city is notably interested in the New York project, because when it is completed dressed meats from that point can be deposited in London in seven and a half to eight days by the new route. The cost of the improvement is estimated at \$2,500,000.

THE MARKET-STREET CABLE ROAD, in this city, is probably the best-paying property of the kind in the country. The road is said to pay six per cent interest on \$6,000,000, an amount more than double what the road cost.

THE MEXICAN GOVERNMENT is building a railroad similar to the Panama railroad across the Isthmus of Tehuantepec. It is broad gauge. There are no tunnels in it, as it goes through a pass in the mountain chain.

CABLE ROAD FOR SAN JOSE.—Arrangements are being made for the construction of a cable road between San Jose and Santa Clara. The estimated cost is \$170,000.

USEFUL INFORMATION.

ADULTERATED CAMPHOR.—Crude camphor is adulterated with common salt, sulphur, vegetable matter, tar, and water. Its purification can be best accomplished by sublimation in glass flasks of a capacity of eight pounds to ten pounds, at a temperature of 400 degrees Fah. These flasks are made of thin glass, with flat bottoms and short necks. They are put into a sand bath, where a uniform and rapid heat can be applied. The crude camphor is broken up, mixed with three to five per cent freshly slaked lime and one to two per cent iron filings, well sifted and introduced through a funnel into the neck of the flasks. The flasks are then put into the sand bath, covered with sand to the neck, and heated gently for half an hour to expel the water. As the temperature increases the camphor softens, and finally melts. After the whole mass has become fluid the sand is removed from the upper part of the flask and a paper stopper put in to close it partially. The heat is then carefully preserved at a point sufficient to sublime the camphor, but not to remelt it. In this way a very pure article can be obtained.

CIGARS AND MEN.—If a man smokes his cigar only enough to keep it lighted, and relishes taking it from his mouth to cast a look at the curl of smoke in the air, set him down as an easy-going man. Beware of the man who never releases his grip on his cigar and is indifferent whether it burns or not. He is cool, calculating and exacting. The man that smokes a bit, rests a bit, and fumbles the cigar more or less, is easily affected by circumstances. If the cigar goes out frequently the man has a whole-souled disposition, is a devil-may-care sort of a fellow, with a lively brain and glib tongue, and generally a fine fund of anecdotes. A nervous man, who fumbles his cigar a great deal, is a sort of popinjay among men. Holding the cigar constantly between the teeth, chewing it occasionally, and not caring if it is lighted at all, are the characteristics of men who have the tenacity of bulldogs. The top stands his cigar on end, and an experienced smoker points it straight ahead, or almost at right angles with his course.

ECONOMY IN COAL FUEL.—One of the most difficult things to teach a girl is economy in fuel. Nothing seems to satisfy but a continual piling on of coal. As soon as a little gas has been burned off a vigorous shaking and a raking out of ashes follows; then the stove filled anew, touching and lifting the covers, which soon become red hot, and the process is repeated from morning till night. Teach her, in order to obtain and secure a good draft, the coal ought never to be above the lining; and in this connection I am reminded of another practice, which seems to come to kitchen girls by intuition or handed down by tradition, that is, to put sadirons, or flatirons, as generally called, on the stove over the hottest fire hours before use, consequently they are ruined, for if once heated to redness will ever after retain heat but a short time, and lose their smoothness too. I would rather lend anything else to a neighbor than a flatiron. In ironing have two holders to use alternately, thereby lessening the heat of the hand, and insuring a greater degree of comfort.

TO PREVENT SCREWS FROM RUSTING.—Great trouble is often experienced from the rusting of screws when they are placed in damp situations. When they are employed to join parts of machinery, they often become so tightly fixed that they can only be withdrawn with considerable trouble, fracture sometimes resulting. In order to avoid this inconvenience, screws are generally oiled before being put in their places, but this is found to be insufficient. According to the *Moniteur Industriel*, a mixture of oil and graphite will effectually prevent screws becoming fixed, and, moreover, protect them for years against rust. The mixture facilitates tightening up, is an excellent lubricant, and reduces the friction of the screw in its socket.

AN EFFECTIVE SOFA ORNAMENT.—A very effective ornamentation for a small sofa is made by taking a strip of satin, plush or of velvet, about five inches wide, and nearly the length of the sofa itself; on this embroider a vine in some distinct and quite open-work pattern. When this is done put a narrow strip of similar material, but of a different color, around it as a plain border. Line it with a stiff cloth, and apply it to the sofa with unseen and immovable pins. It should not be placed in the center of the seat, but be drawn forward so that it is just above the puff or band of plush which finishes the sofa cushion.

MOCK IRON is the name given to an alloy for filling blow-holes, etc., in castings. It is made of one part bismuth, two parts antimony and nine parts lead. It has the property of expanding in cooling, so that a hole filled with the melted alloy will not show any cracks, and the plug will be tight.

"FEATHERBONE," the name of a new article of manufacture, prepared from the quills of geese and turkeys, is largely taking the place of whalebone in the manufacture of whips, etc., for which whalebone was formerly used exclusively.

IRON BOOKBINDING.—Metal is now being substituted in England for cardboard in bookbinding. This novelty is known as the "British

Pellisfort" binding, and it consists in the use of thin sheet-metal for covers. The metal is specially prepared, and the cover may be bent and straightened again without perceptible damage. It may, in fact, be safely subjected to such treatment as would destroy ordinary covers. The metal is covered with the leather usually employed in bookbinding, and the finished book presents no difference in appearance except in the greater thinness of the cover.

TO POLISH PLATE GLASS and remove slight scratches, rub the surface gently, first with a clean pad of white cotton wool, and afterward with a pad covered over with cotton velvet which has been charged with fine rouge. The surface will, under this treatment, acquire a polish of great brilliancy, quite free from any scratches.

LEAKAGE OF PETROLEUM.—Ten years ago, according to Sir Frederick Abel, the loss of petroleum spirit from leakage and evaporation was as much as 18 per cent, but it has now been reduced to eight per cent in many storehouses, and in Germany the leakage is said to be less than one per cent.

AN INCANDESCENT LAMP which requires no vacuum in the globe is said to have been invented in Germany. The wire used is a mixture of conducting and non-conducting elements, the latter preventing the former from melting.

ROUGHING OFF TOOLS.—A round-nosed tool ground on a radius that will exceed the greatest depth of cut, and left with a shearing edge, will make the best tool for roughing off the work end removing the largest amount of material.

TO DEMAGNETIZE STEEL.—First heat it to a red heat, allowing it to cool slowly. Then place the steel on a magnet, with the light poles touching each other, repeating the operation until total demagnetization has taken place.

FLOATING PUMICE STONE.—Large floating fields of pumice, thrown up by the great volcanic eruption at Krakatoa, Java, have been seen in the Indian ocean, nearly 700 miles from where they were seen a year ago.

THE SCREWDRIVER.—The reason that a screw is driven more easily into wood by a long than by a short screwdriver is because the long screwdriver, by reason of its greater length, affords more leverage than a short one.

THE OLDEST PICTURE IN THE WORLD, or what is supposed to be such, is in the museum at Boulak, in Egypt. It is a fresco from a tomb at Maydoom, representing six geese.

GOOD HEALTH.

Second-Hand Air.

Breath is life. At least the breath is the evidence of the union of spirit and body. With the breath, life departs. Added breath gives added life. The power of breathing, or the capacity of the lungs, measures health, strength, longevity, and power of endurance.

Granted that the lungs are doing full duty, what are you breathing—the pure oxygen-laden atmosphere so abundant everywhere, or air poisonous with foul breaths, impure odors, or noxious gases?

The lungs of an adult inspire 22 cubic inches with each breath. A slight calculation only will reveal how soon one must breathe second-hand air if denied access to a fresh supply. How we recoil, and justly, too, at the thought of using even a drinking glass or a towel after another. Cast-off clothing brings to mind visions of filth, parasites, and contagious diseases. Even the outer habiliments of valued friends are worn reluctantly by sensible people.

How much more revolting to take into the lungs, the most vital and sensitive organs, air which has been used by the smoker or drunkard; by one afflicted with catarrh, consumption or scrofula. Such second-hand air is repulsive and may contain germs of disease, while the absence of oxygen and the presence of carbonic acid gas render it positively injurious.

To conserve heat and yet provide pure air is yet one of the unsolved problems. A lack of oxygen taxes to the utmost the vitality of attendants upon our elegant churches and theaters. Our public conveyances are filled with air not only second-hand, but hundred-hand. Our luxurious sleepers are whited sepulchers. Our living and sleeping-rooms are built with reference to the demands of comfort and health except in regard to the one universal need of fresh air. Indeed, the majority of modern dwellings are sealed habitations. From the weather-strips and other means used to prevent the ingress and egress of air, one would judge the human family to be a kind of perishable fruit, requiring potent hermetical sealing to prevent decay.

For stove-heated homes a special warning must be given. As the blasts and blizzards of winter are upon us, if life and health are valued, an effectual mode of introducing pure air into dwellings must be sought. The simplest is to raise or lower a window sufficiently to allow a current between the two sashes. Especially should the sleeping-room have a constant supply of pure air. Two or three times a day open doors and windows so as

to allow the escape of every particle of second-hand air. The loss of heat will be more than compensated in the power to resist colds and acute attacks.

A false idea currently prevalent is that cold air, fresh air and drafts cause colds and influenza. He who is sensitive to drafts, who chills at sight of an open door or window, is nearly always one who is striving to live on second-hand air. This produces an inflamed condition of the system, and the life principle is enervated, the power of resistance gone.

It does not require so large an amount of fuel to raise pure air to a given temperature as to raise impure air. But a higher temperature is needed to give a sensation of warmth in a close room than in one that is well aired. Every heating apparatus should be in itself a ventilator. The open grate gives simple, practical and satisfactory results, and is an economical investment considered from the standpoint of health. Partial ventilation is secured by connecting the apparatus of the indoor water-closet with the kitchen chimney, thus causing the constant current of warm air to carry off offensive gases.

The prevalent fear of night air is fallacious. Confined and deodorized night air is more to be dreaded than that which comes fresh and breezy from the steril heavens. Sleeping or waking, fresh air is necessary to existence; it is essentially a part of life.

We clip the above valuable hints from the *Watsonville Peajaronian*.

DIPHTHERIA.—This insidious disease, which is just now so prevalent in this city and State, awakens the most painful memories in thousands of hearts. Just at this time it appears to be raging with terrible energy everywhere throughout the northern hemisphere—in this country, not only on the Pacific Coast, but in the Eastern States as well. It is also raging with even greater violence in many parts of Europe. In one town in Hungary it has lately broken out with fearful force. Out of 20,000 inhabitants in one city, 2135 persons were recently sick at one time with diphtheria, and 1000 of the sufferers died. With reference to remedies a German paper recently gave the following: "We deem it a public duty to make known every remedy which may snatch even a single victim from death. Thus, we learn with much interest that strong port wine or fiery meadira and malaga is being used on the part of physicians with great success against diphtheria. Even in a case where a poor child had already been given up, and they had been unable to decide upon the well-known tracheotomy operation, the life was saved by a glass of strong port wine. It is related in one instance that special medical officer Dr. Fiedler, in Dresden, was extraordinarily successful with the child of a State official. The child was already lying in the throes of death when, through the fire which the port wine communicated to the veins, in a short time a heavy perspiration broke out and the fungus and phlegm, which would otherwise have brought about suffocation, were ejected."

A SUNNY ROOM A POEM.—Let us take the airiest, choicest and sunniest room in the house for our living-room, the workshop where brain and body are built up and rewarded; and there let us have a bay window, no matter how plain in structure, through which the good twin angels—sunlight and pure air—can freely enter. This window shall be the poem of the house. It shall give freedom and scope to sunsets, the tender green and changing tints of spring, the glow of summer, the pomp of autumn, the white of winter, storm and sunshine, glimmer and gloom—all these we can enjoy as we sit in our sheltered room, as the changing years roll on.

FOR SCALDS, BURNS, ETC.—The following was recently sent to the *Call*, of this city, by a Boston lady, who stated in her letter that it was not only a specific for scalds and burns, but also for bee stings, bites of insects, and even reptiles: "Make a strong decoction of lobelia herb; apply at once, cold, and keep the part wet with the fluid till the fire subsides, which will not be long. Then the cuticle will, in most cases, be sensitive, and should be covered with collodion, the ether in which is cooling and soothing, and will finish the cure and prevent the skin from breaking. In nine cases out of ten the lobelia will prevent blistering."

TAKE A MOMENT'S REST.—A very important secret of life and good health is learning to rest in the midst of confusion—such confusion, say, as that which follows turning the pantry loose upon the kitchen, preparatory to cleaning the former. Stop when that terrible exhaustion comes over you, leave the kitchen, go to the most restful spot in the house, and there sit for a few moments in absolute quiet, taking in deep draughts of that soothing but invisible influence permeating the whole atmosphere, but which we cannot receive unless in a state of mental tranquillity.

HOW WILL HE LEARN?—The medical student of Maine must dissect before he can become an M. D., but the law provides that no bodies shall be dissected except those of executed criminals, and another law abolishes capital punishment.

NEURALGIC OINTMENT.—The *Journal of Chemistry* gives the following: Menthol, 45 grains; cocaine, 15 grains; chloral, 10 grains; vaseline, 5 drachms. To be applied to the painful part.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Cor. Amador Ledger, Jan. 29: W. Q. Mason's mine, near this place, is sure to be a good mine. The tunnel is 200 feet, and the ledge will be tapped about 80 feet below the surface. A few days ago we had a conversation with Mr. Gillick in reference to his mining property in this place. This mine is located on Sutter creek, one mile below town, near the owner's house. The mine consists of two ledges, each about four feet wide and running parallel. One is on the surface. On this ledge a shaft has been sunk to the depth of 40 feet. The ledge is increasing in thickness, and contains free gold in abundance. The mine owned by Benj. Ross, about half a mile from Volcano, and near the Downs mine, gives evidence of a promising future. Sinking has been progressing for the past six months. The ledge is three feet in width, and experts say it will pay \$50 per ton. The Robinson mine, on Clapboard gulch, is coming into prominence among mining men, and its future is very flattering. John Griesbach has struck it rich again in the extension of the Old Pioneer ledge that yielded so handsomely about seven or eight years ago. Frederick & Williams are operating upon a newly discovered quartz mine about a mile from Pete Denzer's place. The tunnel is in about 100 feet, and gold can be seen in the rock. The boys feel jubilant over the outlook. Mr. Gillenwater, of San Francisco, lately purchased from Terry Gillick the mine commonly known as the Whitmore mine, located in Humboldt gulch, about one mile from town. A force of men are at work day and night running a tunnel into the hill to strike the ledge at a distance of about 200 feet from the mouth. This mine in early days was considered rich, some very nice specimens having been found.

MCKAY.—Amador Ledger, Jan. 29: At the Amador or McKay mine, south of the Moore, the shaft is down nearly 120 feet. Some of the ore extracted lately shows considerable free gold, and the owners have increasing confidence in the value of the property. It is the intention to go down 300 or 400 feet, before making any attempt to run drifts. The Quartz Mountain mill and mine were attached last Tuesday by A. McWayne, of Drytown, for a debt of over \$800 against the Graham brothers, the owners or bonders of the property. While from all accounts the mine has been paying something over expenses, it is said that \$2000 per month in free gold was obtained from 10 stamps, and that the sulphurets were very rich and would yield \$1500 or \$2000 more. At this rate, it certainly ought to have paid its way, and this debt is a surprise. W. A. Nevills left San Francisco last Saturday, with the intention of proceeding to the East and from thence to England. His trip is purely a business one.

SUTTER CREEK.—Surface work has been commenced in earnest at the Wildman. C. E. Fournier has secured the contract for building the hoisting works, and with several other carpenters commenced work framing timbers Monday morning. Knight & Co. are busy with the iron work. They are also making 2000 feet of 13-inch pipe to connect with the Amador canal. Twenty stamps at the Lincoln mill are kept running steadily, and the rock seems to improve both in quantity and quality as the ground is opened up.

THE KENNEDY.—Dispatch, Jan. 29: It is reported that the Kennedy M. Company has decided to make a change in the superintendency of their mine near this place, and that Mr. J. F. Parks, of Amador, will take the position of superintendent on the first of next month, in place of Mr. F. F. Thomas, the present superintendent. Mr. Thomas, we understand, is going to Calaveras county to take charge of some mine in that county, but we are not informed as to what mine it is.

Calaveras.

THE GWIN MINE.—Calaveras Chronicle, Jan. 29: A Mr. Couzelman, of St. Louis, arrived here last Monday evening, and remained two or three days. We learned that the gentleman named had come to get information concerning the Gwin mine, in the interest of a company to which he is to report the results of his inquiries and investigations. In the absence of Mr. Wm. M. Gwin, who is the owner of the mine, and who is at present East, Mr. Couzelman sought information from responsible parties as to the location of the mine which he visited, and during his stay in these parts spared no pains to seek and interview those workmen who were employed in the mine just previous to its closing down, for the purpose, of course, of learning points and facts concerning the mine that would be of importance to the company in whose interest Mr. Couzelman is prosecuting his investigations and inquiries, and to whom he is to make a report of the result of his labors. Although we have no assurances of the matter, the prospects are that in the not distant future there will be operations commenced on this valuable mine. That it is a valuable piece of mining property, explorations have proven. The shaft upon the mine reaches a depth of over 1500 feet, with a splendid body of paying ore, and the requisites are heavy appliances in the way of machinery to undertake the work. We hope to see something done upon this property, which offers the best of inducements for profitable quartz-mining investment.

MURPHYS.—Mountain Echo, Jan. 26: Since the rain has set in we have a marked improvement in all mining matters, which doubtless will continue throughout the coming season. The Oro Plata paid off last week, and in consequence times are livelier. The working force of the mine is now complete. Since the Burleigh is in operation on the 100-foot level of the Red Wing, adjoining the Oro Plata—some days may be necessary to prepare the workmen in their duties in running the machinery—there can be no doubt as to the final success of the adoption of this method of extracting the ore on this level. The company has spared no expense to facilitate work, and the development is largely due to the energetic superintendent, F. B. Morse. The 10-stamp mill on the Esmeralda, on Indian creek, is completed and will be run in addition to the pulverizer that heretofore gave such a good account of itself and turned out so much bullion. This mine is situated near Davis' store,

which locality in early days was rich in placer diggings. The owners are young men from the Bay city, but seem to hit the spot in the right place. The rock is free milling, of good quality, and has a reputation second to none in this vicinity. Other mines in this vicinity bid fair to rival in richness any in the county. Increased activity is noticeable since the rains have set in. Gulch miners are at work and times are better in consequence. The claim on Central hill, owned by McCormac, Bisbee & Thomas, is now in operation, and will soon give a good account of itself. They employ about 10 men; it is a paying institution, and its owners are deserving of the success they have met with, and richly merit their reward. Other mines in this section give promise of good returns and claim the attention of mining men, who often visit us. The late rains have aided in adding to the increase of products in minerals, etc., and will be productive of good.

El Dorado.

GRIZZLY FLAT.—Placerville Observer, Feb. 1: The Mount Hope Co. has a tunnel in 300 feet on the vein, and a shaft 200 feet deep. They have a good ten-stamp mill and hoisting works. It is reported that work will soon start up under the management of H. H. McClellan. The Melton Mining Co. has been laboring for three years on a tunnel, which is now completed, striking their ledge 400 feet from the surface. The ledge is five feet wide and the ore pays on an average \$30 per ton. The Kemp mine has a tunnel in 600 feet, with a six-foot ledge. A test of ore from this mine shows it to be of low-grade, but with facilities for cheap working will justify the erection of a mill, which is now in contemplation. The Sunday mine has a tunnel in the hill 400 feet. At the mouth of the tunnel a shaft is down 100 feet, also a winze 40 feet deep in the tunnel, showing a ledge from 2 to 4 feet in width all bearing gold, some of it high grade. The Bullard mine has a snug 8-stamp water-power mill, ditch and extensive tunnel. The ledge is small and the walls hard, which makes it of doubtful character. The Idaho mine recently bonded by a San Francisco Co. has a ledge eight feet wide of gold ore supposed to be of low grade. The Ohio mine was worked in 1853 by Capt. Tellis, and paid well as long as it was worked with the aid of a wheelbarrow. It was afterward sold to the Valde-lora Co., of Boston, and by them abandoned. It was subsequently located by Alex. McAfee, who is now sinking a shaft to strike a rich ore body known to exist. The Hale and Norcross mine, still further south, was worked with a small arasta, propelled by a jack, in 1852, and was shortly afterward abandoned. Within the last two years this ground was located by Dennis Gallagher, who sold it to Joseph Lyon, John Melton and others, who have sunk about 35 feet, and have found the richest average ore perhaps in the district, giving as high as \$300 per ton—but are unable to contend with the water without expensive machinery which they have not means to purchase. The Carrie Hale Placer Mining Co., at Henry's Diggings, have their ditch in good order and are attempting to work their gravel, channel through an incline. They have good gravel, but their plan of working is doubted by mining men.

Fresno.

THE MINERAL BELT.—Fresno Republican, Jan. 28: Of all mining counties in this State there is none which offers such inducements to those seeking investments as Fresno county. Her mineral resources are unlimited, and we only require more capital to place her at the head of the bullion-producing counties of this State. There is not a gold mine in the county which has been worked by experienced mining men but what has proven a success in every particular. A few more such men as Hearst, Ewing, Gillet, Haley, Grayson and McNally is all we require to place her at the head of the list as a gold-producer. Undoubtedly the most important gold belt in the county is that which the Texas Flat and Surprise mines are located on, and what is commonly known as the Blue Gauge lode, and it is indeed a lode worthy of the consideration of all seeking after permanent mines. This lode is a contact vein lying between granite and slate, with well-defined walls, and can be readily traced for ten or more miles. On leaving the Surprise mine in Grub gulch and traveling a southeast course, we come to the Butterfly mine, on the Fresno river, now being judiciously developed by Mr. Poole. Continuing on the line of the lode some two miles, we come to where the Hawkeye Mining Co. is opening it with most flattering results. West in line is the Texas Flat mine, near Coarse Gold, which is being developed in the most systematic manner, and when sufficiently developed will be worked on a large scale. Two miles on is the Blue Belt mine, recently discovered, which at a depth of ten feet shows a four-foot ledge of rich quartz. Preparations are being made to sink 100 feet on this newly discovered bonanza. Continuing on the line of the lode we come to the McFarland mine; thence the Nate Harbert; thence the Last Chance, which has its ten-stamp mill running day and night. Then to the Mountain View mine, on Fine Gold gulch, which is reported sold for a large sum. Few sections in this State can show such an immense lode as this, and few lodes are worthy of as much consideration as this one. Many claims between the mines mentioned are being developed, and all with good results. A grand boom is predicted along this lode the coming season, and capitalists who may visit it will not go away disappointed.

Inyo.

THE MARBLE MILL.—Independent, Jan. 29: Mr. Luce, superintendent of the marble quarry, says the mill, so far as completed, is running in good shape. A gang and one rip saw are in operation, and they are doing good work. The quality is fine; there is no fear as to quality or quantity. Mr. Luce was assured that all the machinery for additional saws would be delivered at the quarry about the middle of December. But the makers failed to be on time, and up to the beginning of the present week the last piece of machinery had not been delivered. There is plenty of demand for all the marble the mill can turn out when working up to its full capacity.

ORE SHIPMENTS.—From the Brown Monster, Tom Bastian and his partners shipped two carloads of ore to San Francisco a few days ago. At Darwin a good deal of ore is being taken from the Lucky Jim and Defiance mines. A miner who went through all the workings of the Defiance lately,

says the mine now looks better than ever before. From Lookout, Frank Fitzgerald is shipping ore regularly, teams are constantly employed hauling from those places to Keeler. Tom Crough recently took out and shipped some fine ore from the claims he is interested in at Red Hill. Wilnot, Whitaker & Thorpe had a large stock of supplies taken to the White Hill at the end of last week, and have begun work under a lease for one year from Barnes & Kehoe.

Napa.

THE GOLD AND SILVER MINE.—Independent Callistogian, Jan. 29: Of the 540 feet of tunnel through the hill to connect the Grigsby & Johnson mine in King canyon with their mill to be erected in the canyon on the other side, a little more than 200 feet of drifting remain to be done. Work progresses night and day, but very slowly, as the rock is hard. Very little more than a foot a day is excavated. At this rate the tunnel will not be completed until the latter part of May, and not then if rock harder than that now found is met with on the course. Over the creek near where the preparations are being made to construct the mill plant, a heavy substantial bridge has been built. It is 30 feet long and about 25 feet to the water below. Over this all the lumber and machinery for the mill will have to be taken. The mouth of the tunnel on the side of the hill will be above the mill, and ore brought through it on cars will be dumped in the chute and discharged into the mill. A dozen men find employment about the property now, though this number will be more than quadrupled in a few months.

Modoc.

COAL.—Adin Argus, Jan. 27: Wednesday morning P. S. Early started for the recently discovered coal mine in Hot Spring valley, on a prospecting tour. He has leased the mine for a period of 60 days, and will immediately put some men to work sinking on the vein.

Mono.

THE STANDARD CON.—Bodie Miner, Jan. 26: Ore shipped to mill for week, 275 tons. Several appearances of ore bodies without material change. Mill running steadily.

THE BULWER CON.—North drift, 200-foot level, was extended 10 feet, showing the vein two feet wide. There were employed six miners, \$4 per day; one foreman, at \$6; and jointly with Bodie and Mono, one blacksmith, at \$4.50; one helper, at \$4.

THE BODIE.—Upraise from west crosscut on second incline level was extended 13 feet. North drift, from upraise from 620 level, was extended 14 feet.

THE MONO.—South drift on 800 level was extended 23 feet; west crosscut from south drift, 800 level, was extended 14 feet. There were employed five miners and one carman, and jointly with Bodie, three engineers, two firemen, one pumpman, one carpenter, one watchman, two carmen, one foreman, and jointly with Bodie and Bulwer Con., one blacksmith and one helper.

CON, PACIFIC.—West crosscut, 135-foot level, has been advanced nine feet; total distance from shaft 36 feet; south drift same level advanced six feet; total distance from shaft 35 feet.

Nevada.

WOOD'S RAVINE.—Nevada Transcript, Jan. 29: The work of prospecting at the Muller & Walling claim on Wood's Ravine, a mile or more in a north-westerly direction from town, has been going on for the past two years by a series of cuts and shafts. Last fall a crushing of 20 tons of ore was taken out. It showed well in free gold in the coarser and decomposed sulphurets, and yielded \$16 to \$20 a ton. This claim is on the same vein as the Nevada City mine, which it joins on the north. It is the intention to sink a regular working incline and put on a pump and hoisting works. This will no doubt soon develop into a good mine and add another producer to this district. Messrs. Lord & Sharkey, further up the ravine, have made some fair developments during the past year. They have cut the vein in four different places by inclines, one 40 feet, one 35 feet, and two from 18 to 24 feet in depth. The vein, which is from 3 to 7 feet in width, has now been opened for a distance of 1200 feet in length. This is now considered one of the best prospects in the county by miners whose judgment in such matters commands respect by reason of the success with which their operations have been attended. The character and extent of the deposit of ore, which shows well in free gold and is in places heavy with sulphurets, indicate that a mill on this property would be profitable. It works from \$9 to \$26 a ton. Still further up the ravine, on the south end of the Mt. Auburn claim, considerable prospecting has been done during the last year with good results. The incline was sunk 80 feet and some good-paying ore was taken out. The Kirkham brothers are now running a tunnel on the vein which is from 3 to 4 feet wide and has paid from \$18 to \$35 a ton. Had one-half the money expended on the north end of this claim been applied to the development of the portion now being worked, there is good reason to believe the Mt. Auburn would have been in full and profitable operation to-day.

NEW QUARTZ MILL.—Grass Valley Union, Jan. 29: The young men who own and are working the W. Y. O. D. quartz claim on Kate Hayes hill are now putting up a five-stamp mill to crush the ore from the mine. The mill will be run by water-power, which will be conducted through 2400 feet of pipe, the water being received from the Empire mine drain tunnel. There are now on the dump 50 loads of good ore, and by the last of February, when the mill is completed and in running order, the amount will be increased to 100 loads. The W. Y. O. D. claim is doing splendidly, and so far the quartz has yielded a fine profit. The six owners are young men who do all their own work.

CROWN POINT MINE.—Grass Valley Union, Feb. 1: There have been rumors at different times of the sale of the Crown Point mine, of this district, and within a few days these have been renewed; but the Union is able to state authoritatively that the mine has not been sold, and is not likely to be unless it is taken at the figures that Mr. Gauthier has placed upon the property, which are largely above any offer that has been made. He is now anticipating the making of improvements by which the mine can be worked on a more extended scale than at present. The shaft is of but two compartments, four feet by eight, and only sufficient quartz could be raised through it to keep a ten-stamp mill going,

whereas if the shaft was in three compartments, with two car tracks, sufficient quartz could be raised to keep a 30-stamp mill going, as the ledge now in the north drift on the 300-foot level is from nine to ten feet between walls, and four men on a shift keep the mill going. The great size of the vein shows what an immense body of quartz will be opened up when another level is sunk, which will be in good time, after the present shaft is enlarged from two to three compartments. There is every appearance that the Crown Point is a great property, but its riches cannot be produced as rapidly as they should, because, as stated, the want of present facilities for raising the ore, but when the improvements are made which are in contemplation the mine will be an important producer. It is paying well now, and has been for a year or more.

Placer.

SATISFIED.—Placer Republican, Jan. 29: William Gray, who leased the Sharon mine at Alta, has got the mine pumped out and the machinery in working order, and he is well satisfied with the present prospect. At the Last Chance claim they have got their shaft down and struck good pay on the bedrock. They are now running drifts, and if the pay continues they will work on an extensive scale. Several other mine-owners talk of prospecting for drift diggings.

Plumas.

BUNKER HILL CON.—Plumas National, Jan. 29: This mine is situated in Plumas and joins the famous North American mine on the north. There are 20 shareholders and they have pushed the prospecting with energy. After running a tunnel about 800 feet in bedrock they raised up last week about six feet, striking a fine body of gravel that prospects very rich, one pan of dirt yielding \$3. The Bunker Hill promises to rival in richness the famous Bald mountain of Sierra county. W. Metcalf, of Nelson Point, is superintendent and part owner. The owners are all hard-working miners and some of them have been interested in the ground since 1857. They deserve their good luck in payment for their unlimited faith and persistent energy in prosecuting the work.

GENESEE M. CO.—Greenville Bulletin, Jan. 27: Messrs. Bidwell & Watson of the foundry are turning out a new set of cams, tappets, shoes, dies, etc., for the mill on the above property, which is soon to be started for the coming season's work. It is said that quite extensive improvements on the property are contemplated this summer. The mill, including the water-wheel, will be thoroughly overhauled and hoisting works erected. The past record of the mine and the well-known financial standing of the present owner, Joe Gruss, would seem to fully justify the contemplated additional outlay.

Shasta.

SILVER.—Redding Free Press: Reid and Hi Bemis have purchased Mike Shay's interest in the Bakakala mine. There are 15 partners in this silver mine. Mr. W. R. Conant came down Wednesday from the Uncle Sam mine, on Squaw creek, bringing with him about \$1000 in bullion, being the clean-up of the plates alone after a two days' run with 10 stamps. The mill is running day and night, and the above is about the average produced. S. P. Fillman informs us that a Huntington mill, rock-breaker, concentrator, engine and pumps have been purchased for the Texas and Georgia mine, and that competent miners have been employed to attend to the mine. Active operations will prevail, and it is expected that large results will be realized. Mr. Jewett, superintendent of the Black Bear mine on Squaw creek, was in town last week. He appeared to be highly elated when speaking of the improvement of the output, which the brick he brought down verified. They have sunk a shaft, and are now running a crosscut with the best kind of results. The mine adjoins that of W. R. Conant's. Mr. Baker, of Ono, who was here last Monday, informs us that there is a great deal of travel through that place to Bullychoop, and that a boiler weighing four tons, besides 20 tons of other machinery, passed through last week for the Cumberland mine, owned by Foster & Cornwall, who are now laying the foundation for a 20-stamp mill, but only 10 stamps will be put up at present.

IRON MOUNTAIN.—Courier, Jan. 29: Iron Mountain will be booming in a few weeks. The original discovery mine bears the name of Lost Confidence, but Charles Camden, Colonel Magee and James Sallee have never lost confidence in the great richness of the immense ore body which they have developed. The ore is now being worked under the superintendence of Sallee by a different process from that employed by Ellsworth, and is rolling the bullion out in a style which would make the eyes of an old Comstockite stick out as big as an ostrich egg. We understand that other mines on the mountain will be worked in the spring, and the indications are that a large number of men will find employment there in a short time, but at present there is an oversupply of miners in every part of the mines that we have heard from.

GRAVEL.—Dr. Bell has for years owned a gravel claim on the flat on Grizzly gulch, just below the mouth of Studhorse gulch, and about three miles above Desmond's hotel. Owing to ill health the doctor could not very actively attend to the development of the mine. Some time ago he took in a partner by the name of Damon, a practical miner and good worker from Colorado, who recently struck a bed of gravel rich in coarse gold. The prospect justified the erection of hydraulic works; iron pipe was ordered at Volentine's, and this week Mr. Damon came down with a team and transported the pipe to the mine, and the gravel will soon fly at a lively rate. They will have a continuous water supply and good pressure, and it is the wish of the friends of the owners of the mine that they have struck a bonanza.

CLEANUP.—Democrat, Jan. 26: Last week a 60-ounce gold brick was cleaned up from the Black Bear mill, Squaw creek, after a seven days' run with a Huntington mill, crushing on an average of about five tons a day. In the lower tunnel of this mine they have a 12-foot vein that prospects from wall to wall.

BAR.—Scott Bar on Scott river was noted in early times as being immensely rich, and millions have been taken out there. Lately the Magofey Brothers have struck a big bed of rich gravel in the hill back of the bar.

Sierra.

NEW DISCOVERY.—Sierra Tribune, Jan. 29: We hear that a new quartz lode has been discovered near

the mouth of Kanaka ravine, which is about half-way between Sierra City and Downieville. The lode was found by a prospector from near Camptonville, named James. The report is, that the lode is four feet thick, and the ore is very rich in many places. Some very fine specimens have been shown around town this week. The vein has been traced for the length of four claims, and is said to run at right angles with all the other veins in the vicinity.

Trinity.

BULLYCHOOP.—Cor. Red Bluff *Sentinel*, Jan. 29: As you are already aware, the mill started up last June and run until the present, crushing ore at the rate of 16 tons in 24 hours. The yield was from \$4 to \$16 per ton and plenty of ore in sight to run for years to come. There is now on the ground, ready to be set up, a new 10-stamp quartz mill. There is plenty of wood, good water, good roads, a good hotel; and a sawmill will soon be put up to supply the mine with building material. There are at present about 40 men and four families in camp. The men are all at work, and the hotel does a good business, board being \$20 per month. In the spring there will be work for double the number of men that are here now. The winter has been very mild so far, and at present there is no snow on the ground, but the indications are favorable for a storm. Bullychoop is situated about 50 miles northwest from Anderson, in Trinity county, and is sure to be the boss mining camp in Northern California. There are other mines in the immediate vicinity which are yielding very rich ore, and everybody is in good spirits and happy.

Tuolumne.

GOLD.—Tuolumne *Independent*, Jan. 27: We hear good accounts of the Maryatt mine, at Tuttle-town. On the lowest level the chute has been found 200 feet long showing gold. On Sunday, one and one-half tons of powder, a Burleigh drill and other implements were received at the mine from San Francisco, and work will be prosecuted vigorously. We have strong hopes that this mine will prove a valuable property.

THE HYDE MINE.—Sonora *Democrat*, Jan. 29: Some interesting tests, not by assay but by practical mine workings, have been lately made by Mr. Louis Blanding on the ores of this mine to determine their value. The tests were made on samples of 50 pounds each taken from the dumps with great care to obtain average values. The ores from which the samples were taken came from different points of the mine in depth and length along the line of the vein. The results obtained are important, as they go to show the great value of the mine and also the fact that the San Francisco gentlemen who had a bond on it which expired on 15th December, made a great mistake in not taking the mine, having been strangely misled by the late superintendent as to the value of the ores, and this has been shown to be the case by the results obtained by working lots of ore selected by the superintendent as low average and pronounced by him to be of little value, yet proved to be worth by mill work nearly \$8 per ton in free gold. The ores tested by Mr. Blanding, samples taken by himself, came from the crosscut at face of north drift on level 350-foot level 210 feet from shaft, where the vein is 26 feet wide of solid ore and the result showed a yield in free gold, per ton, from \$8.40 to \$11.18. And also from the face of the south drift on same level where the vein is four feet wide and the working on this ore in mill gave a result of \$28.30 in free gold and showed 2½ per cent of sulphurets worth \$100 per ton and a combined value in free gold and sulphurets of \$33.05 per ton of ore. These tests were made on the ore coming from the deepest point of development of mine, the good quality of the ores in the upper portion of the mine having been heretofore demonstrated on hundreds of tons in mill.

NEVADA.

Washos District.

SAVAGE.—Virginia *Enterprise*, Jan. 29: 500 level—East crosscut No. 2 has been advanced 52 feet, the last 30 feet being in quartz, carrying ore. 800 level—Engaged in easing timbers and timbering drift. West crosscut No. 3 on this level has been extended 18 feet. Have encountered quite a heavy flow of water. The face of this crosscut is now in quartz, carrying some fair ore. 600 level—Stopping ore. Hoisted through the Gould and Curry shaft all that the ore dump of that company will contain. Will commence hoisting ore from this level through our own shaft on Monday next. 1640 level—The main north drift has been advanced 100 feet and the south drift 65 feet from the Suro tunnel. Near the face of the north drift have started an east crosscut, and another from the face of the south drift, in the quartz body.

HALE AND NORCROSS.—1300 level—South drift has been advanced and timbered 50 feet. It is entering softer ground and a heavy clay formation. West crosscut No. 2, south boundary, has been extended 35 feet. 1200 level—The south drift has been advanced and timbered 25 feet, and east crosscut therefrom 30 feet. North drift has been advanced and timbered 20 feet, and east crosscut 25 feet. Both of these drifts are in quartz that give some fair assays.

CROWN POINT.—More prospecting work is being done on the 300 and 400 levels now than during the last week. The intention is to run the lateral drift on the 400 level south into the Belcher. It being near the surface, the veins encountered are narrow, running from 2½ to 6 feet wide. The Mexican mill is kept running steadily on ore from the lower levels principally; that produced from the upper levels works from \$15 to \$20 a ton.

OCCIDENTAL.—Upper tunnel—The south drift from the north incline winze has been extended 11 feet; total length, 92 feet. The east crosscut has been extended to feet; total length, 36 feet. From the north drift, same level, the west crosscut has been extended 12 feet; total length, 16 feet. At the 800 station in north incline winze are preparing to start a drift south. Extracted 12 tons of ore.

BEST AND BELCHER.—600 level—No. 2 west crosscut has been extended 44 feet; total length, 114 feet; porphyry formation in face. 800 level—West crosscut No. 4 has been extended 28 feet; total length, 160 feet; porphyry formation.

THE QUINN.—This famous old mine, below Silver City, is being actively reopened. Inside of a week the retimbering of the shaft will be completed to the

depth of 100 feet from the surface, heavy 12x12 timbers being used. The new machinery for the steam hoisting works is about being delivered on the ground, and will be set up as soon as men and money will allow. This machinery is of a capacity for sinking 1500 feet or more.

GLADSTONE.—For the week ending January 31st, we have driven the tunnel 10 feet. The waterflow remains about the same. The ground in the face of the tunnel is still in the veinstone and shows signs of near approach to the ledge, which we expect soon to cut. Are working the same number of miners.

SIERRA NEVADA.—520 level—West crosscut No. 6 has been extended 11 feet; total length, 62 feet. The south lateral drift from crosscut No. 2 has been extended 45 feet; total length, 74 feet; porphyry formation with stringers of quartz.

BELCHER.—The Vivian mill is crushing about 40 tons of ore a day, and the Santiago about 100 tons. The ore comes principally from the 1400, 1500 and 1600 levels.

YELLOW JACKET.—Shipping about 150 tons of ore daily to the Brunswick mill. This ore comes from the 1200, 1300 and 1400 levels. Everything going along smoothly.

POTOST.—Running south drift No. 2 on the 250 level. It is 100 feet east of south drift No. 1, running parallel with it, and is in about 80 feet; the face in quartz.

ALPHA AND ENCHEQUER.—On the 122 level three separate drifts are being extended; one east, one south and one north. All are in quartz.

UTAH.—472 level—At a point in the main west drift 400 feet from the shaft a north lateral drift has been advanced 36 feet. This drift is in vein porphyry.

GOULD AND CURRY.—425 level—The east drift has been extended 37 feet; total length, 142 feet. The upraise has been extended 22 feet; total length, 50 feet.

SCORPION.—Have finished the station at the 300 level, from which point a drift has been started east.

NORTH GOULD AND CURRY.—Working two shifts of men. Are sinking and prospecting. Everything looks favorable.

IMPERIAL.—Repairs to the shaft continue. Work is being done now near the 900 level.

EAST BEST AND BELCHER.—Cleaning out shaft, preparatory to doing important work.

CHOLLAR.—Shaft cleaned out and retimbered to a depth of about 500 feet.

Alum Orisk District.

PANNED OUT.—Esmeralda *News*, Jan. 29: D. W. Milsaps has been at work on a claim which he has relocated in Alum creek district named the Relocated Pride of Nevada. During the week he encountered a six-inch streak of decomposed quartz, from which he extracted 15 pans full of dirt and washed it out, obtaining therefrom \$140 in gold. He has shipped the dust to the Selby refining works.

Aurora District.

THE SILVER LINING.—Walker Lake *Bulletin*, Jan. 29: Very encouraging reports, relative to the Silver Lining, come from Aurora. The company is energetically pushing the work of developing this property, and a marked improvement in the tunnel which is being driven, rewards their efforts. The ledge alongside the tunnel is showing a great deal of free gold, and even the strata of quartz in the tunnel are highly mineralized and carry free gold. The property is improving steadily and never looked better than it does at present, and without doubt it will soon be one of the most valuable mines in Esmeralda county. So long as such promising mines as the Silver Lining are worked by capable and experienced men, the outlook for Aurora is more than favorable.

Como District.

PROMISING.—Virginia *Enterprise*, Jan. 29: The prospects for a new lease of life and activity in Como, Lyon county, shortly, are highly promising. Specimens taken recently from the 150 level of the Como-Eureka mine show free gold to the naked eye. The North Rapidan Co. thinks its mine shows as good prospects as the Como-Eureka, but will not proceed with development work until spring.

Gold Mountain District.

THE CORONET MILL.—Walker Lake *Bulletin*, Jan. 29: The Coronet Mining Co. has a new five-stamp mill nearly finished on the Amargosa flat, near Gold Mountain. It is expected that the stamps will begin dropping about March 1st. The Coronet Co. is a San Francisco incorporation which owns a number of gold mines near the new mill. The property has been thoroughly prospected; there is a large quantity of good free ore in sight, and it will require but a short time after the mill begins work to accumulate a dividend-paying fund.

Hawthorne District.

NEW DISCOVERY.—Esmeralda *News*, Jan. 29: Pat Shannon and Frank Thorn have recently discovered, in Hawthorne district, about 3000 feet easterly and in the Lapanta belt, a ledge over two feet wide which contains a 12-inch streak of the crumbled white quartz ore, the same as that of the richest of the Lapanta ores. They are sinking upon the ledge and are taking out a considerable quantity of this ore. Last Tuesday they sent the *News* a specimen of the ore weighing four pounds that is very handsome. The claim is named the Evening Star and bids fair to be one of the most brilliant gems of that golden region. Success attend you, boys!

Jackrabbit District.

ONONDAGO.—Pioche *Record*, Jan. 27: The Onondago mine, Jackrabbit district, is looking "way up." The ore continues going down, down, and keeps growing richer in silver. The indications promise immense. Considerable ore has been shipped the past two weeks. The poor little orphans who are interested in the mine believe that they have a grub stake for the remainder of the winter, whether snow flies or not. The assays made from the recent strike show \$295.27.

Mount Ross District.

PARADISE.—Cor. *Silver State*, Jan. 27: The engine shaft in the Paradise mine was completed last night, and crosscutting will immediately be commenced to cut the vein. The work of development is being vigorously pushed ahead at all available

points, with some very encouraging indications. The judicious and energetic exertions of the management are deserving of great credit, and are sure to be successful at no distant day, as the ledge surely exists below the break.

Tuscarora District.

NEVADA QUEEN.—Have started crosscut from gangway on 350-foot level to connect with the shaft; have advanced 13 feet. Rock is very hard. Connection has been made between the shaft and west crosscut No. 1 on 200-foot level. Station is being cut out and timbered and will be finished in two or three days. Shaft has been sunk 9 feet. Cutting out for station intersected somewhat with sinking. Bottom of shaft is 21 feet below the 200-foot level.

TORNADO CONSOLIDATED.—Tuscarora *Times-Review*, Jan. 29: Tunnel extended during the week 9 feet; total length 192 feet. West crosscut advanced 9 feet.

BELLE ISLE.—Belle Isle and Navajo joint crosscut west, 150-foot level, has been extended 25 feet.

NAVAJO.—North drift on new vein, 150-foot level, has been extended 11 feet.

NORTH BELLE ISLE.—North gangway, 400-foot level, has been advanced 33 feet. Rock is hard but breaks well, with a slight increase of water.

ARIZONA.

CUSTOM MILL.—Prescott *Courier*, Jan. 27: Mr. John S. Jones, a mining man who has made a favorable impression in this section, left for New York last evening, intending to return here in about six weeks. Mr. Jones has purchased a mill, and proposes to establish and run complete reduction works on Groom creek, six miles south of Prescott. He will purchase ore on dumps, or anywhere else.

STRIKE.—Clifton *Clarion*, Jan. 27: A very rich strike is reported to have been made ten miles north of Clifton and a group of mines located. An assay of the ore has been made and gives an average of \$40 in gold besides a fair showing in silver. The location of the mine is a good one, being within one mile of a fine mill-site. The owners of the property are B. W. Magin, H. Garvey and D. M. Potter, of Silver City.

COLORADO.

CLAIMS WORKED.—La Plata *Miner*, Jan. 22: A number of claims on Anvil mountain are being worked this winter. Chestnut & Hackett have a force of men working in the IXL tunnel. The heavy storms of late have made the ore shipments proportionately light. The Uncle Sam, on Cement creek, will be worked under lease the coming season. The owners of the Transatlantic are drifting on the vein and taking out some fine gray copper ore. Four men are working the Queen Anne at the head of Cement creek. The shaft is down 70 feet in a large body of coarse galena ore mixed with gray copper. Work is progressing very favorably at the Silver Lake. Six men are employed, and an immense quantity of ore has been piled up for shipment. Tim Malone has got quite a pile of ore on the dump of his claim, above the Washington on Kendall mountain. He is now doing development work, and expects to have a large amount of ground opened by spring. Good news continues from Humboldt gulch. The Carbonate King shaft is still following down their big ore body, and it is now half-way over the bottom of the shaft. The showing compares favorably with the best mines in the district, and the property seems likely to become one of the leading shippers of 1887. A portion of the Grand Prize force was employed Wednesday in sinking on the body of carbonates which was lately cut in the north drift. One hundred and eight sacks were filled the first day, which will weigh nearly five tons. This ore is worth about \$80 per ton, and the day's work at which only two men were employed is merely an illustration of what can be taken out when a full force shall be put to work on the big ore bodies.

SEVEN-THIRTY MINE.—Georgetown *Courier*, Jan. 27: Work has been somewhat delayed upon the Seven-thirty mine during this month, owing to the preparations for placing a new double hoisting engine at the main shaft. This engine is being built for Mr. Griffin, by Messrs. Fraser & Chalmers, of Chicago, and will enable him to sink 1500 feet if he desires. At a depth of 1400 feet connection can be made with the Burleigh tunnel, and outlet obtained level with the railway. From 1500 to 2500 feet of stopping ground will then be available—drained and ventilated. The Burleigh tunnel is in 2300 feet, and has 15 acres of patented ground at its mouth to which a switch has been built by the railway company for the convenient shipping of ore. Twelve hundred feet from the entrance of the tunnel, connection has been made with a drift from the Victoria tunnel, which has given a good circulation of air for both tunnels. In the Seven-Thirty the work of development is being continuously pushed forward. The orehouses are full of ore awaiting shipment. In the six months ending December 31st, ore was marketed to the value of \$58,637.76. Mr. Griffin has obtained government patents to 11 miles upon the veins centering in Brown gulch, and intends to develop them as far as practicable by the main shaft and drifts driven each way therefrom until connection is made with the lower tunnel. There are about three miles of underground drifts and tunnels already opened and operated with T rails and cars. This mine has been one of the steadiest producers in the camp for the past ten years. Judging from this and its present appearance we feel confident Mr. Griffin will be well repaid for the expenditures he is now making in permanent improvements. This mine is on a true fissure vein which can easily be worked to a depth of 5000 feet below the surface by a combined development of shafts and tunnels. It has already added \$1,000,000 to the output of our country, while as yet its main shaft is only 400 feet deep.

IDAHO.

SMELTER.—Ketchum *Keystone*, Jan. 26: The Bayshore smelter for the year 1886 shipped via Ketchum seven cars bullion aggregating 162,670 pounds, being the product of a very short run. All contracts having expired by which the Queen of the Hills disposed of its ore, the ore is now being stored until a new contract can be effected. The Germania, in Germania basin, owned by J. D. Wood,

produced 50 tons of ore in 1886, which was worth about 100 ounces silver and 50 per cent lead. Lead during the past year has fluctuated from \$5 per hundred, its highest point, to \$4.05, its lowest price. Its closing price at the end of the year 1886 was \$3.85. At the end of the year 1879 it was \$5.60. Jas. Brennan and Wm. Turner came down from the West Fork mine Saturday. Mr. Brennan has a contract to run a prospect tunnel 200 feet long in that mine. The tunnel is in about 70 feet and a 10-inch vein of good ore has been found. Every indication favors the discovery of a rich body of ore. The firm of A. J. Crook & Co., owning the Clayton smelter, Salmon river, shipped via Ketchum during the past year 18 cars of ore aggregating 438,270 pounds. This ore was chiefly from their Skylark mine near Bayhorse. They also sent out 21 carloads of bullion, 469,175 pounds, made at their Clayton smelter.

MONTANA.

A SUCCESS.—Helena *Independent*, Jan. 27: One of the marvelous successes in mining in Montana is the Minah, a property of which little is publicly heard. It is situated one and a half miles from Wickes. In February of last year it was the merest prospect. It was taken hold of by J. O. Briscoe and Chas. F. Blake, who immediately began developing it, while the prospect was covered deep with snow. They have worked from the grass roots down, and the following is the output for the ten months ending Dec. 31, 1886: Number of tons of ore marketed, 5143; gold, \$58,344.47; silver, \$151,848.00; lbs. of lead, 769,119. \$34,610.22. Total, \$244,802.69. Average value per ton, \$47.59. This ore has all been shipped, but a plant for handling the ore on the ground is now in contemplation. The mine now presents about 15,000 tons of ore in sight with the small development that has been made.

NEW MEXICO.

THE COONEY MINE.—Socorro *Bulletin*, Jan. 29: The Silver Hill Mining Co.'s properties, including the celebrated Silver Bar No. 1, otherwise known as the Cooney mine, received but little attention this year, the company's mill not having dropped its stamps. We are informed, however, that during the current year the latter property, and several other valuable claims, owned by the Silver Hill Mining Co., will be explored and exploited in the most industrious manner by our old friend and staunch miner, Capt. M. Cooney, and that the company under his supervision will at once commence the erection of an improved concentrating and milling plant of large capacity. There are numerous other valuable claims in the Mogollon districts, which in the present year will come to the front as producers, but this high-grade mineral section of this county will only appear at its best and secure that attention from capital which it merits when the Socorro and Magdalena branch of the A. T. & S. F. R. R. awakens the echoes of its towering cliffs with its screech of civilization, and upon good authority we believe that this much to be desired end will be secured before the close of spring.

OREGON.

GLENDAL.—Cor. *Jacksonville Times*, Jan. 29: The surrounding country, which is conceded to be one of the finest mineral districts of the Pacific Coast, is attracting widespread attention by the recent rich quartz discoveries, the most notable of which is the Green Mountain ledge, owned at present by Messrs. Jones & Wilson, who have lately bought out the other partners. Large quantities of quartz have already been taken out of this ledge, which shows plenty of gold and several other minerals as well. The owners will erect a mill near the ledge shortly. They employ a force of men tunneling and getting ready for mill work. The next in importance is the Mount Pisgah ledge, which is owned by Keenan & Ingelman of Grant's pass, and which prospects finely and promises to rival the Green Mountain. Another is the Bonanza, owned by Levens & Hays, who are having it thoroughly prospected, and which is presumed to be of fabulous richness. There are numerous other ledges, of which we will speak anon. Of placer mines the Whiskey Creek mines are the richest. They are owned by Sherer & Judson, of Grant's pass, and located on Whiskey creek, which has its source in the mountains northwest of this place, and which is a tributary of Rogue river. Mr. Norris, the manager of these mines, came out a week since, bringing with him \$500 in beautiful pieces of gold, the largest of which weighed 547. Another placer mine of importance is the Canyon Creek mines, owned by Chas. O. Walker, of Portland, who is personally managing the same. These mines are operated by hydraulics, and piping is carried on day and night. All expect to hear of splendid results from these mines when they clean up, which will be soon. There are several other mines of minor importance and Glendale is the shipping point for all.

UTAH.

REVIEW.—Salt Lake *Tribune*, Jan. 28: The week has been a quiet one in mining circles, the specially notable feature being light receipts of ore locally, though the shipments abroad have been fair. The weather has been cool but pleasant. The receipts in this city for the week ending Jan. 26th, inclusive, were \$172,308.76 in bullion and \$15,518.09 in ore, a total of \$187,826.85. For the previous week the receipts were \$179,870.31 in aggregate, of which \$145,243.28 was bullion and \$34,627.03 was ore. The Ontario bullion output for the week was 34,520.27 fine ounces, and \$17,187.88 in ore sales, a total of \$51,808.15. All goes well with this property. On the 31st the Ontario will pay dividend No. 128, or 50 cents a share, or \$75,000, thus beginning the new year in the old and agreeable way. This will be an even eight millions paid in dividends by the Ontario. The Daly output for the week was 20,511.13 fine ounces bullion, and \$5133.66 of ore sales, a total of \$25,644.79. The metal receipts for the week have been divided, as usual of late, into many classes, as follows: Fine bars, \$43,739.74; base bullion, \$18,700; sulphides, \$5832.32; gold bars, \$4400; pure silver bars, \$20,095; bullion, \$8088.92; this besides special bullion named herewith. The Germania smelter produced, during the week, \$20,295.25 in bullion; the Hanauer, \$18,260. The Stormont sent up, on the 24th, silver bars valued at \$3050.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or
other Mineral Substance to any degree of fine-
ness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh
dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York
Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on
application.

THE FRISBEE-LUCOP MILL CO.,

Office, 104 & 106 Washington St., NEW YORK.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Care of this Paper.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Office—47 Roe St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorey, 529 Commercial St., S. F.

Legislative.

The consideration by the committee of the appropriation to the State Mining Bureau is referred to at length under another heading.

Ohleyer's bill to facilitate the service of injunctions has been refused a second reading in the Assembly, the Judiciary Committee having reported against it.

A bill has been introduced by Boggs appropriating \$100,000 to provide and maintain a permanent fund for the purchase and manufacture of jute for San Quentin.

A bill has been introduced appropriating money to erect a monument over the grave of James W. Marshall, at Coloma, near the scene of his discovery of gold. As the State was ungrateful to this man during his lifetime, she may redeem herself, to some extent, in the eyes of the world, by erecting a monument to his memory. Some time since an attempt was made to secure money by subscription to erect a monument. The State should do it, however, and it is to be hoped that the bill will pass. The discovery of gold here led to such marvelous results to California and to the world, that the man who first found it should at least receive this small recognition from the people among whom he lived.

Senator Walrath has introduced in the Senate a bill to provide for amicable adjustment of troubles between employers and employees through a State Arbitration Commission.

The following is the full text of a very important Assembly joint resolution introduced by Mr. Campbell:

WHEREAS, Under the rulings of the Circuit Court of the United States, as well as the rulings of the Courts of the State of California, the mining industry of our State is in imminent danger of being entirely suppressed; and

Whereas, California is the only State in the Union, or in any other part of the world, in which such rigid judicial decrees have been enforced against the miners as to render mining an outlawed industry and illegal, as mining cannot be carried on without debris; and

Whereas, This industry which has built up an empire on this coast, and upon which such vast interests depend, and upon which the welfare of so many thousands of hard-working people depends, is now in "extremis moris;" and

Whereas, Under the common law of England, in its adaptability to our wants and necessities, and which is the guide of our courts in their decrees against our miners, it is impossible to continue that industry openly and legally without some legislation to protect it; and

Whereas, The miners, as a class, are at present unable to carry on their industry and works without the fear of being enjoined by some judge of some court in our State, which proceeding means eternal ruin; and

Whereas, It is the opinion of this body that some congressional legislation is not only desirable but necessary to protect this industry; therefore, be it

Resolved, That our Senators be instructed and our Members of Congress be requested to take such steps as will, in their judgment, relieve the mining industry of California from its present status, and to that end procure the passage of a resolution of Congress, by which the sum of \$40,000, appropriated by the last session, by false statements, to prosecute the miners, be rescinded, and the unused portion of that money, together with such other sums as can be procured from Congress, be applied to the construction and maintenance of such impounding reservoirs as may be sufficient to retain all mining debris either in the valleys of the streams which have heretofore been used as dumping-places from the mines or elsewhere, and that such money be expended by the U. S. Government Engineers.

The Committee on Mines and Mining have only briefly considered Walrath's bill for impounding mining debris. The bill provides that any number of persons, or corporations, not less than three, who have appropriated, purchased or leased, or may hereafter do so, may form a general incorporation to build dams or works to restrain debris, and have the right to condemn private property for such works as provided by law.

State Engineer Hall has appeared before the Irrigation Committee on Langford's bill abolishing his office. He came prepared with data and maps, showing his plans for irrigation and claiming that the office should not be abolished until his work on the irrigation problem shall be completed. The committee decided to report against Langford's bill and allow Hall one year in which to complete his work.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, Jan. 31, \$74,536, making a total of \$284,595 for January, with one cleanup to come; Bluebird, Jan. 28, \$22,704; Reno Reduction Works, 26, \$3500; Granite Mountain, 26, \$100,000; Marget Ann, 27, \$4000; Moulton, 27, \$17,200; Alice, 27, \$24,192; Hanauer, 25, \$5160; Stormont, 25, \$3050; Hanauer, 26, \$2720; Germania, 26, \$11,990; Bannock, 27, \$3130; Hanauer, 27, \$2640; Germania, 27, \$4085; Hanauer, 28, \$2600; Germania, 28, \$3675; Sprucecroft, 29, \$6500; Hanauer, 29, \$2565; Crescent, 29, \$2980; Germania, 29, \$4067; Hanauer, 30, \$4850; Bluebird, 31, \$23,600. Last week Wells, Fargo & Co. shipped from Salt Lake, \$79,872 in bullion; McCormick & Co., \$28,065; T. R. Jones & Co., \$57,796; Union Bank, \$22,593.

MECHANICS' INSTITUTE.—The Nominating Committee to select the "regular ticket" for the Mechanics' Institute have nominated the following for trustees for the coming year: Columbus Waterhouse, George Spaulding, C. F. Bassett, James Spiers, John Mallon, Irwin C. Stump, and S. J. Hendy.

Mining Share Market.

The prices of stocks have been rather lower the past week. Quite a number of assessments are being levied just now, to the regret of those holding the stocks. The Virginia Chronicle has this to say of the situation: The weak tone of the market is due in a measure to the management below intimating that there would be only a 50-cent dividend declared by the Con. California and Virginia the current month. The one thing requisite to revive public interest in mining share speculation and cause a marked improvement is an important development in Ophir and substantial proof of the existence of alleged valuable ore deposits in the middle mines by converting it into bullion, which, if the assays range as high as represented, can be accomplished by steam-power and leave a handsome margin for dividends above the cost of production. It is rumored that the Potosi Company is now negotiating for the lease of the California battery mill of 80 stamps, and if successful in securing it, will immediately start it up on ore from the mine.

New York Metal Market.

Telegraphic advices dated Feb. 3d give the following New York prices:

BAR SILVER—\$1.02½ per oz.
BORAX—\$4.64 c.
COPPER LAKE—\$19.00 @ \$11.
IRON—One ton, \$10.00 @ \$19.50.
LEAD—\$4.25.
QUICKSILVER—54 @ 55c.
The following is the latest by mail from the "New York Metal Exchange Market Report":
COPPER—Dull, spot closing at 11.40. Transferable Notices (Lake) issued at 11.25. Transferable Notices (Chili Bars) issued at 1.38 1/16.
LEAD—Quiet at \$4.25 @ 4.40 spot. Transferable Notices issued at \$4.33 1/2.
TIN—Active at \$22.50 @ 22.60. Transferable Notices issued at \$22.60.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.75 @ 22.90; Billiton Tin, \$23.10 @ 23.40; Banca Tin, \$23.15 @ 23.50; Baltimore Copper, \$10.35 @ 10.50; Oxford Copper, \$10.35 @ 10.50; P. S. C. Copper, \$10.35 @ 10.50; Foreign Lead, \$4.75 @ 4.85; Foreign Spelter, \$4.75 @ 4.85.
MAKERS' PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.00 @ 21.50; No. 2, \$18.50 @ 19.00; Grey Forge, \$17.00 @ 18.00. Hudson River, Grade No. 1, \$20.00 @ 21.00; No. 2, \$18.50 @ 19.00; Grey Forge, \$16.00 @ 16.25. Southern, Grade No. 1, \$19.50 @ 20.50; No. 2, \$18.00 @ 18.50; Grey Forge, \$17.00 @ 17.50.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
 2. The freight to mine is less than one-half of stamps.
 3. The cost of erecting is less than one-fourth of stamps.
 4. The power to drive it is less than one-half of stamps.
 5. The wear is less than one-quarter of stamps.
 6. There is no wear except on shoes and dies.
 7. In point of amalgamation it is superior to any other machine in use.
 8. In its simplicity of construction.
- We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings,
cogs or pulleys

Power applied direct. Works Ore at Low Cost.
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and
amalgamating ore, and costs less. All who have used this mill
recommend it highly. Splendid for low-grade ore on account of
low cost of working.

Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, JR.

This new and important book is on the use and con-
struction of Ditches, Flumes, Dams, Pipes, Flow of Water
on Heavy Grades, methods of mining shallow and deep
placers, history and development of mines, records of
gold washing, mechanical appliances, such as nozzles,
hurdy-gurdys, rockers, undercurrents, etc.; also describes
methods of blasting; tunnels and sluices; tailings and
dump; duty of miners' inch, etc. A very practical work
for gold miners and users of water. Price, \$5, post-paid.

MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ore of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ore DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE of OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machine EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Fulfilling ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Saving Floured Quicksilver.

We mentioned recently the experiments made here in the direction of saving floured quicksilver in milling operations, by means of an electrical current, and stated that further experiments on a larger scale were soon to be carried out practically at the Douglas mill, Carson river. Dr. Ras took back to Nevada with him a dynamo for making the working test. From an account in the *Dayton Times* of last Saturday we take the following paragraph concerning the test made:

At 1 o'clock last Thursday, everything being in readiness, the wires were connected with a settler in the Douglas mill at this place, eight feet in diameter and four feet deep, filled with pulp and water, and the machine put in motion, a sample having first been taken from the settler and a like sample from another settler, charged at the same time with the same material. After running one hour both settlers were again sampled and it was found that while the one that was not connected with the electric machine showed no perceptible diminution of floured quicksilver, the one so connected showed a decrease of about 50 per cent. Upon taking samples again at the end of two hours' run, the disconnected settler showed a decrease of 10 to 15 per cent of floured quicksilver, while from that which was being operated upon by the electricity, the quicksilver had almost wholly disappeared. Altogether the test has proved a great success.

Dr. Ras sends us the following additional particulars: "Upon finding that one settler worked so well, the currents were attached at once to two settlers, with even better results. The millman for the trial of the two settlers ran the amalgamating pans ten hours so as to purposely increase the quantity of floured quicksilver. At the third trial of four tons, no floured quicksilver could be seen, and, on examining the sluice-boxes, little if any could be found, while the quicksilver recovered was bright, lively, and healthy."

Since that trial another one has been made, of which Dr. Ras, under date of February 7th, says: "We cleaned up yesterday two more tons, making seven tons, with same result, and have shut down the mill to clean up three pans and three settlers. Tuesday we shall run three settlers with the electric current as against others run in the ordinary way, and have the quicksilver weighed out in each set. We shall run 50 tons and then clean everything up, and weigh back quicksilver and bullion. We had probably 50 visitors Sunday, and all could, and did, see the decrease of floured quicksilver in each successive test. Times of running settlers is reduced one-half. It looks like a splendid success."

The jury in the now famous McWhorter murder case have returned a verdict of not guilty. McWhorter, of the Marysville *Democrat*, wrote something which gave offense to one Robinson, who is stated to have been an "anti-debris spy," and in a quarrel growing out of this, McWhorter shot and killed Robinson. The case has attracted wide attention by reason of being connected, as above stated, with the mining debris controversy.

The mineral cabinet at the State Library is to be removed to the Crocker Art Gallery in Sacramento. Both the State Mining Bureau and the State University wanted this collection.

The Southern Pacific railroad will run its road through to San Diego from San Juan Capistrano.

A Time and Longitude Indicator.

James H. Culver, of this city, has invented and patented through the MINING AND SCIENTIFIC PRESS Patent Agency a simple device for indicating the relative time and longitude of different places. There are two straight scales, made of wood or other suitable material, one of which has upon it the degrees and divisions of time. It is made with two complete divisions

MADDEN'S SHIELD FOR BOILER FURNACES.

of 360 degrees, the first commencing at the left end with 0 and ending at the center with 360 degrees. The divisions of time commence at the same point at the left end with 12 o'clock midnight, and end with 12 o'clock midnight, 24 hours later, at the center. The degrees commence again at 0 at the center and end with 360 degrees at the right end of the scale, and the time divisions in like manner begin with midnight at the same point and terminate with midnight, 24 hours later, at the right end.

The record, or movable scale, is one-half as long as the first-described one and has the names of places printed upon it at points which indicate their relative longitude, and it will be manifest that by moving this scale over the first one the relative time and longitude may be ascertained the same as with a circular scale.

Selling Stock on Margins.

Though so much has been said for years about the evils of stock gambling, and the danger of poor men dealing in mining stocks, it is nevertheless true that a great many miners all over this coast continue to dabble in stocks. Moreover, most of these transactions are carried out on the "margin" system, by which the buyer only deposits a certain proportion of the value

action was \$348.65, of which Maguire paid the brokers \$100, and they assigned the remainder of the claim to Shain, who brought suit for the recovery. Justice Burke held that the contract between Maguire and the brokers was unconstitutional, and quoted Section 26 of Article IV of the Constitution of California, which he claimed prohibits dealing in stocks on the marginal system. The plaintiff will appeal the case to the Superior Court, on the ground that several New York decisions have held that such sales were valid.

A Shield for Boiler Furnaces.

Wm. Madden, of the Keystons Boiler Works, this city, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a shield or protection which is specially useful in connection with boiler furnaces, where great heat is brought upon the angles and flanges of certain portions of the boiler. It consists of a protecting shield for these portions, by which they are relieved from the effects of excessive heat, and leakage, by the constant unequal expansion and contraction, is avoided.

The accompanying engravings show the device. The upper figure is a sectional elevation of a boiler, showing the application of the shield. Below is a perspective view.

In the present case the invention is shown as applied to boilers of that class having large flues in the lower part, with grates upon which the fire is built, bridge-walls at the rear end, and a combustion chamber at the front of the boiler. These boilers are usually made short, and where the high pressure of steam is carried, must be made correspondingly thick and strong.

At the point *a*, the flanges of the inner head or the flue-sheet are turned and riveted to the shell of the furnace, making a lap-joint of considerable thickness, and the exterior of this angle is exposed to the most intense heat from the fire while the interior is in contact with the water of the boiler. The thickness of the metal is such that very unequal expansion takes place at this point, and the result is a strain which causes leakage, so that it is almost impossible to keep the joint tight, and the boilers need constant overhauling and repair on this account. In order to protect this portion from the direct action of the flame and heat of the fires, the inventor forms an arch of fire-clay or brick, as shown at *b*, which extends a short distance each side of the joint and prevents actual contact of the flames with it. This arch may be either built of fire-brick or fire-clay. In the present case, the engravings show a semi-circular iron arch or hoop (having feet or flanges at the bottom, supported upon the bridge-wall at each end, and it is provided with projecting lugs or ridges, *c*, within which the body of fire-clay or the fire-brick may be held and prevented from falling out of place. This prevents the direct action of the heat upon the angle and prevents it from great and unequal expansion, which would otherwise take place, and prevents the strain and consequent leakage at this point.

Active quartz prospecting operations are in progress on Wood's ravine, near Nevada City. The ledges are large, and the crushings give results of from \$9 to \$35 per ton.

of the stock. If the stock goes up he is all right. If it goes down his margin is soon wiped out unless he puts up "more mud," as the slang phrase is. It will therefore interest miners to learn that Justice of the Peace Burke, of this city, has decided in the case of Shain vs. Maguire that the marginal system is unconstitutional. During the recent stock excitement Maguire authorized the stockbrokers, Hadley & Doud, to sell 100 shares of Con. California and Virginia on margins, and agreed to furnish the certificate at a future date. The stock was sold as directed, but Maguire afterward refused to deliver the certificates and the brokers were obliged to purchase 100 shares of the stock at the advanced price of \$757.50, sold in order to fulfill the terms of their contracts with the buyers. The difference resulting from this trans-

The Reno Reduction Works.

So quietly and unostentatiously has the work of construction been prosecuted since the formation of a company to build reduction works in Reno, says the *Gazette*, that very few people understand the real size and importance of the institution. To-day, however, after a very few months' time has elapsed, the ore is actually being worked, and the shining silver is being shipped away. One remarkable

Feature of the Works

Is that not a plan has been drawn on paper and not a stake has been stuck by a surveyor. A preliminary line was run by Mr. Bridges to establish the amount of fall that could be obtained, but after that the only chart to work by was in Mr. Howell's head. He marked the places for the wheel, the tail-race, the building, furnaces and battery, with all the shafts, pulleys, heling end everything, and not one was moved a quarter of an inch from the mark, and everything works smoothly and correctly without a jar or creak. No less remarkable is the fact that Mr. Howell's estimates of total cost have come out exactly. He has put in ten stamps instead of five, and four pans instead of two, and the whole outlay is just \$1500 more than he asked for in the first place. It is difficult to describe the workings of large and complicated machinery, but enough can be said to show even the layman the *modus operandi* of divorcing the precious metals from the dull company it has kept so long. The ore is carried to the doors on the north side of the building in cars on a side-track built from the Central Pacific road. This brings them on a level with the floor of the ore-room, 30x100 feet, over which there is a strong loft and below which two stories of the works stand on benches toward the river. On the ore-floor the rock is thrown into the breaker, from which a bucket elevator carries it up to the loft. It is then sampled and the sample goes back to the ore-room, and through a small rock-breaker and into a grinder, after which it is taken to

The Assay Office.

Here, Mr. Cerey, who has been associated with Mr. Howell for many years, is considered to be more directly in charge. He has the furnace and scales in a small wooden building apart from the main works, where the book-keeping is also done. The main body of ore, after the sample has been obtained, is dropped from the upper ore-loft into a self-feeding hopper above the battery. Here it is crushed by the ten stamps working on the dry process, and is carried along to the elevator, which raises it to the self-feeding bin, over a 60 inch Howell telescope-cylinder furnace, which is the largest size made.

The Furnace.

This furnace is, next to the battery, the most striking feature of the works. It is a huge iron cylinder, the upper end of which enters a brick flue and the lower a great brick fire-box.

The vast iron cylinder rests in drivers turned by machinery that keeps it revolving at the rate of eight revolutions a minute. The cylinder is slightly lowered at the big end, so that as it turns slowly around, the powdered ore works along toward the dumping place and is released by the dropping of two iron folding doors, operated by chain gear, into an iron car which is run out on a track and carried by a derrick to be emptied on the ore pile to cool. All this is on the middle bench which forms the second story, the ore floor being the upper one, this the second and the pen-room the lower one. An iron door can be raised on the side of the furnace right over the fire so one can look right through the cylinder and see the fine particles carried up the sides of the slowly turning cylinder and dropping in a constant shower of red-hot snow through the intense heat that passes from the furnace through its whole length and out into the flue at the other end. The cylinder has a capacity of at least 30 tons in 24 hours, and is able to do double the work of a 10-stamp mill. There is about 300 pounds in at any one time, and it is exposed for 45 minutes in passing. The feed can be changed so it will be a longer or shorter time, and the different kinds can be mixed to suit each other. The Howell furnace has been in use for 10 years and is an invention of the president of these works. Nothing compares with it as a chloridizer and oxidizer. It does the work of 10 stamps with two cords of wood and one man's time. It is also used as a dryer to take the moisture from the ore before it goes to the stamps.

The Fumes from the Furnace

Pass out into a brick-dust vault outside the building, which is divided into five chambers. It stretched out they would be 80 feet long. The vault is a solid brick structure 60x20 feet, with iron side-doors through which the accumulations are removed. The fumes from the high stack over the dust chamber have been largely relieved of their load in passing, but still contain antimony, sulphur and zinc. The thick, white smoke is the heaviest in sulphur. The roasted ore goes into the pans on the same floor and thence to two settlers on the next floor below. Here there is an engine and hoiler, pumps, the retorts, etc. The 30-ton water-jacket furnace and Baker blower are being erected on this floor, and in time

A Copper Smelter

Will be set up alongside of it. About 550 bushels of charcoal will be used every 24 hours unless it is found to be too light. If it is, it

will be mixed with coke. The company is impounding the tailings, so that the river is hardly stained. The wires for the electric light are strung, and the same wheel will give power to the dynamo that runs the works. This is a 50-inch Leffell double turbine wheel made in Springfield, Ohio, which Mr. Howell thinks is undoubtedly the best wheel made for heavy work. It is being caged in heavy wire to keep out float ice. The 112-horse power comes from the river through a ditch 900 feet long, with a dam 110 feet long and six feet high. It can be raised a foot and the whole river turned in and the power quadrupled. It speaks volumes for the future to see such a splendid power obtained by a ditch only 900 feet long. It will, in time, line the Truckee with factories and make a great manufacturing city here. It is cheaper, safer and swifter than even natural gas.

The Ore is Being Worked

In an entirely satisfactory manner. It is coming in double the quantity that any one expected, and will continue to increase as fast as the works can handle it.

Virginia City has a great deal of base ore which will come here. Mr. Howell could get a good deal of ore to mill if he had more stamps. At \$6 a ton, the price paid on the Carson river, it would pay well. It would be necessary to name almost every town on the C. & C. and most of those on the C. P. as far as Elko, besides Eureka and Austin on the east, Grass Valley and Ophir on the west and Cedarville and Cottonwood on the north, to tell where the ore is coming from. The company has got out a

Schedule of Rates

Which is as follows: For milling ores they pay 90 per cent of the gold and silver in ores assaying 300 ounces and under.

For ores assaying from 300 to 500 ounces per ton 93 per cent, and ores assaying 500 ounces and upward 95 per cent.

Milling charges \$14 per ton. Silver at the current rate of discount.

For smelting ores they pay 90 per cent of the gold, silver and lead on ores carrying 50 per cent lead and under, and charge \$14 per ton for reduction.

For ores carrying over 50 per cent lead, they pay the same percentages of gold, silver and lead as above, and charge \$10 per ton for working. For large lots still lower rates will be made.

Ores sampled and paid for as soon as received, and sacks returned to the shipper. There is no charge for sampling and assaying. Railroad rates from any point are furnished on application, and are very low.

The next thing needed is more stamps for free-milling ores and well-equipped refining works to separate the silver, gold and lead. The capital might easily be increased to \$100,000 right away and may be twice that in a few years. In time, chemical works to save the zinc, sulphuric acid, etc., will pay.

The Bounty for Mines.

Williamson's bill to encourage prospecting and develop the mineral resources of the State of Nevada has caused considerable discussion. Following summary of the arguments, for and against, is taken from the *Austin Reveille*:

"Those who argue against it, claim that the State finances could not stand the drain which would result from the Act; that the corporations or large mine-owners would reap the benefit, and that it gives too much sway to the practices of fraud which would result from the remoteness of many ledges from settled districts. That it would benefit only the rich districts, as \$100 per ton is rich rock and is found in comparatively few sections of the State. That the low-grade ore would receive no encouragement. The prospector who gets ten tons which assays \$100 a ton does not need the \$500. Those who favor it, claim that it will encourage prospecting and will lead to the discovery of rich finds, which will in the end overbalance the expenditures of the State, in that the new mines increase the taxable property and add more revenue to the State. Property all around the new discoveries becomes more valuable, and as the nation protects the manufacturing industries in order to foster them, why not encourage the poor prospector in his search for hidden wealth? He has to find new ledges that have not been worked or located, to sink over 50 feet and get out ten tons of rock which will assay \$100 per ton. This will prevent the working of barren ledges for the bounty, and will insure the opening of good ledges. The \$500 will no more than pay the expenses while searching for the ledge, and the property in some cases will become valuable enough, in which event taxes will come to the State which will more than repay the outlay. We would like to see encouragement given to the prospector, but the bill should be explicit so that frauds cannot creep in and destroy the intention of the measure."

THE Union Pacific system's pay-roll includes 20,000 persons. The payment of actual money to employees has now entirely ceased, a system of check payments being substituted. This does away with the handling of money and attendant risk, and the ticket offices at the different stations are made banks where these checks are cashed. The indorsed and canceled checks are then returned to Omaha as vouchers or receipts. If any agent cannot meet the demand, he telegraphs to the nearest station for funds.

La Mina Cordovena.

San Francisco Capital in Mexico.

The superintendent of the company gives the history and description of La Mina Cordovena, situated near Santa Ana, Sonora, Mexico, in the following language:

Some years ago, a Spanish adventurer from the city of Cordova, having read some old works written by the Jesuit Padra describing the mineral wealth and beautiful climate of Mexico, concluded to improve his fortune, and embarked for the land of his dreams. Landing on the western coast of Mexico, he heard of the then famous mine La Pima, whose riches, although worked in a crude way, yielded an amplitude to a large number of natives. Not finding room for speculation here, he studied the situation, sharp and shrewd as he was, and concluded to have a mine of his own. He here happened to fall in with one Pasqual, an Italian fugitive, having a similar object in view; the two set out, following up mineral deposits in search of another Pima. After many hardships and disappointments they found in the craggy and broken ridges of the Pima mountains, the croppings of an apparently rich vein of silver ore. During the subsequent work of exploring the vein, the two disagreed and separated, the Cordovenean, as he was called, keeping possession of the mine; he continued to work and soon had hullion.

About this time the Mexican mining laws, regarding the working of mines, right of possession, etc., were changed, the Government taxing all mines then worked, and making large concessions to capitalists as an inducement to open up the country. This proved too much for the indolent and unskilled natives, who so far had worked the mines in their own way. Many mines were abandoned, or were sold to foreigners, who up to this time could not own them, except in company with a Mexican citizen. The Cordovenean, about this time, went to Hermosillo to dispose of some silver hullion, and, it is said, died there.

A mercantile firm of Benson, A. T., having known of this mine, became its possessors. The new owners went to work sinking a regular working shaft, and intended to open up the mine in good shape. During this time the Sonora railroad was being built, and this firm, holding large contracts, lost heavily and failed. One Mr. Bennet, an employee of the aforementioned firm, became possessor of the mine. He continued the work of developing the mine, and went to San Francisco to put it on the market; he here met H. D. Bacon, a millionaire, who had come into possession of the Pima mine. Pooling their interests, they soon found a company ready to purchase the two mines; an offer of \$200,000 was rejected by Bacon. Bennet held on but a short time, his means being exhausted, the property went out of his hands, and has now by purchase become the property of the present owners, who thus fall heir to a considerable amount of good work done by its former owners in developing the mine. During the past year they have employed a heavy force of miners and spent a large sum of money, and the works are now in such shape as to make the Cordovena the most promising and largest mine in Northern Mexico.

La Mina Cordovena is located ten miles west of Santa Ana station, on the Sonora railroad, Sonora, Mexico, being about 70 miles south of Nogales, the border city of Arizona Territory. It is conveniently reached from the station in two hours by a good wagon road. The mine lies on an elevation of about 200 feet above the surrounding plains in the Pima mountains. An abundance of water for all working purposes is to be had at the foot of the mountains, and a large belt of timber, of dense and heavy growth, in close proximity to the mine, furnishes fuel for all time.

The formation of the ridge, on which this mine is situated and running parallel with it, having a direction from northeast to southwest, is of the most desirable character of formation for mineral, being partly amorphous limestone, as hanging-wall, and having slate as footwall, forming therefore a regular contact, between which the ledge or vein is bedded. The limestone hanging-wall is solid and compact, in taking out the ore very little timber is therefore necessary; this alone forms an item of no little importance when economical and cheap mining is considered. The ledge is well defined from about 40 feet below the surface to the present depth of 235 feet; above 40 feet, and up to the surface, it is somewhat broken up and twisted, owing to former volcanic disturbances.

A large California whim with steel wire rope and iron buckets are the present means of hoisting the ore to the surface, where it is dumped into carts, ready to go to the mill for reduction.

Development of the Mine.

The works of the mine consist chiefly of one vertical shaft 8x8 and 115 feet deep, being sunk on the ledge for about 30 feet (which has a dip to the southeast of an angle of 50 degrees), the remainder of the shaft was then cut through the footwall, or slate; at a depth of 75 feet, a rich body of ore was encountered, coming in from the southwest; examination proved a smaller vein, or stringer, coming in from above, at an angle of 70 degrees, and uniting with the main ledge, or ore body. At the bottom of this shaft a station was constructed and another shaft or incline sunk to the further depth of 100 feet, making the total depth of the main shaft 215 feet. From this level a crosscut was now

run toward the ledge, striking the same at a depth of 235 feet from the surface, and showing the ledge here in the strongest and most desirable shape, the ore as good, if not better, than in any part of the mine.

One hundred feet above this, the present lowest level, another crosscut was run to the south-east, striking the ledge at a distance of 30 feet from the shaft, and the crosscut carried clear through the ledge to the hanging-wall. The ledge shows a width of 20 feet between walls. The principal characteristics of the ore are chlorides, black metal or sulphates of silver, silver glance and horn silver, all being free milling, which was proved by practical milling tests of two months' duration.

The ore in this crosscut, being sampled, showed a surprisingly large result; the lowest average of the whole ledge assayed 21 ounces of silver to the ton, while about 5 feet in the center of the ledge assayed 55 ounces per ton on the average; a drift of 50 feet on the ledge to the southwest showed the ore to be the same all the way as encountered in the crosscut.

Seventy-five feet above this level, or 40 feet below the surface, the ledge was crosscut once more, showing a width to the hanging-wall of 12 feet, and being all ore.

From this point a winze has been sunk on the ore to connect with the 115-foot level, for the purpose of ventilation, and opening up a large body of ore ready for stoping.

The Cordovena mine is 2625 feet in length and 655 feet in width, comprising an area of 40 acres. Beginning at the northeast boundary the croppings of the ore body can now be easily traced for about 2000 feet; numerous small shafts and cuts show a very uniform character of the ore body, the same as shaft No. 1. Toward the southwestern boundary of the mine the ore carries some gold with the silver, and a small show of galena; the latter, however, in so small a percentage as to be no detriment to free milling and amalgamation.

Old Placer Mines.

It is constantly reported that abandoned mines in different portions of the State, which were worked in early days, upon being reopened are yielding handsome profits. Tuolumne county was noted in early times for the richness of its placer mines. Many of them were worked in a manner to get the quickest returns at the least expense, and when failing to pay without increased labor, shafts and tunnels were abandoned and allowed to fall in and fill up. Among these old mines no doubt there are some of them that still contain handsome fortunes. Take for instance Table Mountain near Shaw's flat. Reed, Krytser, Russell, Eakin, Caldwell and others, took out of a river-bed gold enough to make them all rich. Yet there is not one of them that believes they secured near all that the river-bed held. As was expressed, they just scratched the old bed above the drop-off. They worked with many difficulties hundreds of feet under ground, contending with water without the improved facilities of later days. It was demonstrated that the old river-bed, hurried deep under the mountain, was vastly rich for a distance from where it was explored until reaching a drop-off below.

With the knowledge of the times in which it was worked and the appliances at hand, it is certain that the gold deposits were not nearly worked out. If parties with capital will open up this old work again, it promises as favorably as any mining operation that has yet been worked in the county. There are other old mines to which attention can be called that will some time be worked and yield handsome returns. Capital is required to re-enter these old works. The placer miner of to-day is not fixed in that regard, hence he does not seek for them. There are quantities of old ground in Tuolumne that will yet pay largely and prove that the mines are not all worked out.—*Tuolumne Independent*.

UTAH SALT.—The Salt Lake *Democrat* says: Amid all the demoralizing influences at work in these "Valleys of the Mountains," Utah salt has not, in scripture language, lost its savor. There is salt enough in this Territory to preserve and put in pickle the Old and New World. On the shores of Salt Lake, storm and sunshine have deposited vast fields and deposits of the saving mineral. In Southern Utah, huge ledges of crystal salt, mixed more or less with earthy matter, are to be found, from which the quartz mills of Pioche were supplied in the palmy days of that mining camp. Large shipments are at present made to the mills of this and adjoining Territories from Salt Lake deposits. The supply will continue so long as the world stands. The present annual income from the sale of salt is about \$75,000.

BULLION AND BORAX PRODUCT.—Following is the total bullion and borax product of Esmeralda county, Nev., for 12 months commencing October 1, 1885, and ending September 30, 1886: Ores—34,773 tons and 1583 pounds, the gross yield of value of which was \$721,661.54, and net yield on which taxes were paid was \$107,970.26. Borax—Amount worked, 10,369 tons and 484 pounds, the gross yield or value of which was \$109,436.77, and the net yield, on which taxes were levied, was \$10,180.59. It is safe to say that this does not contain all that was produced, but simply what was returned to the assessor.

Impounding Mining Debris.

Following is the full text of the bill introduced in the State Senate by Mr. Walrath, of Nevada county:

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Any number of persons or corporations, not less than three, having appropriated, purchased or leased, or who may hereafter appropriate, purchase or lease, water for mining purposes, may form a corporation, under the general laws of this State, to build dams and other works, to restrain and impound mining debris carried into or down any stream by the water appropriated by them. Places for the deposit of such debris, and for dams and other works for impounding the same, are a public use, and may be condemned and taken by such corporation, in the mode provided by law for taking private property for public use.

SEC. 2. When corporations join in the formation of a corporation under this Act, they shall act through their president, duly authorized by the directors or trustees, with the consent of at least two-thirds of the stockholders, and in addition to the articles of incorporation now prescribed by law, each subscriber to such "articles" shall give a description of the water rights and ditch property owned by him, or the corporation which he represents, and all subsequent subscribers shall give a like description of the ditch and water property they represent, and such a description shall be duly recorded in the office of the county recorder, in the county in which the property is situated, and such record shall be notice to all the world of the liens and rights of the corporation, and the creditors thereof, as hereinbefore provided. Any person or corporation who shall hereafter appropriate or use water for mining purposes, subsequent to the formation of any corporation contemplated by this Act, shall have the right to subscribe to its capital stock upon the same basis and conditions as the original subscribers, and the liability of such description.

SEC. 3. The number of shares of stock in such corporation shall be equal to the estimated number of miner's inches, or other units of measurements, of the water which will probably be discharged from the mines into the stream above the point where the proposed impounding works are to be erected. Each subscriber of stock in the corporation shall take such number of shares of stock as the number of inches, or units of measurement of water appropriated by him, or the corporation he represents, to be used above the impounding works, bears to the whole capital stock of the corporation.

SEC. 4. All property, a description of which shall have been recorded, as herein required, shall be and remain subject to the payment of the debts of the corporation; and no conveyance or lien upon such property shall have priority or shall deprive the corporation, or the creditors thereof, from proceeding against such property, by a joint or several proceeding, after either personal service on the owners of the same, or publication of summons, as required in cases of non-resident defendants, at the option of the plaintiff.

SEC. 5. Any corporation formed under this Act shall have power to levy and collect such assessments from time to time, upon its subscribed stock, as may be necessary to construct and maintain restraining dams and other works necessary or proper to restrain all mining debris on the streams designated in the articles of incorporation above such dams, and other necessary expenditures, which assessment shall be a lien on the property described by each stockholder; and the corporation may collect such assessments, either by an action against the delinquent stockholder for a personal judgment or by foreclosure of the lien herein provided for, and for judgment for any deficiency that shall remain after the sale, under the judgment foreclosing such lien. Ten per cent of all assessments levied and collected by such corporation shall be paid into the treasury of the State, and shall be invested from time to time in such State and Government bonds of the United States as the Governor may direct, to constitute a sinking fund to keep and maintain the dams and works connected therewith, of the corporation, in good order, in case the corporation should become bankrupt, or the property of the subscribers should become exhausted. Whenever it shall become necessary to use such sinking fund, or any part thereof, to maintain such dams and works, the Legislature shall have power to pass all the necessary laws for that purpose.

SEC. 6. Any corporation created under this Act shall be liable for all injuries resulting to any person by reason of insufficiency of dams, or other works, to restrain all mining debris not carried in suspension by the water, or for the damage occasioned by the breakage of such dams or works, by reason of insufficient construction or maintenance.

This Act shall take effect on and after its passage.

THE RIGHT WAY.—Like many other mining excitements, this district is not without a number of prospect-owners who run away with the idea that they have another Hildreth, McNally or Golconda mine, and consequently place a false value upon their property that mining capitalists can't touch with a 40-foot pole. Such men, when they awake from their dreams, will see the fallacy of this course, and will readily speculate upon croppings that assay

\$50 per ton free gold, and purchase such locations say at from \$300 to \$800. If they would then do development work, as other mining men in the district have done, they would stand fair chances of success, and this would be much better than have prospectors do the work for them, and by this means fictitious prices would in a measure be avoided. There are quite a number of opportunities at present for mining men to get lay-outs on paying ledges (croppings) that would justify them in spending a few hundred dollars, or enough to satisfy them of the value and extent of the ledge.—*Fine Gold Miner, Fresno Co.*

The Black Range Mines, N. M.

Some of the mine-owners of this portion of the Black range who have let their properties remain idle, awaiting the starting up of the lixiviation works, had better hestir themselves in order to be in readiness for the mill. Work at the mill is steadily progressing, and its completion is not far distant. The engine has been repaired; now shells have been put on the Cornish rolls; all the leaching, precipitating, and storage tubs are about ready for setting up; all the old machinery that is to be used has been put in order; the foundation of the cooling floor is completed; the excavation for the foundation of the chloridizer, and furnaces are ready for the foundations, and in fact, nearly everything is in readiness for the new machinery, some of which will arrive in a few days. Almost ever since the foundation of the camp, the cry has been: "If we only had a mill to treat our ore we would develop our mines!" There is no question but that we will soon have a mill that will successfully treat the ore of the camp, and the miners should see that the mill is sufficiently supplied with ore to keep it in constant operation. There is no other mining district in any mining country that possesses a quality of ore better adapted to the process of lixiviation than ours, and there is no reason why we should not be counted as one of the main producing camps of the Southwest before the close of the present year. Do not conceive the idea that undeveloped properties will be in demand at fabulous prices, because there are prospects of liveliertimes; mines that bring high prices nowadays must be developed, and now is the time to develop them. The opening up of our mines means business, prosperity, plenty of money, and a railroad. We have a sufficient amount of ore to bring all these things about, were it but taken in hand and properly handled.—*Black Range.*

A CHARCOAL MONOPOLY.—A monopoly of the charcoal business is threatened in this city, and dealers and trades-people using the fuel are somewhat anxious. About 200,000 sacks are used annually in San Francisco by tinmiths, metal-roofers, assayers, jewelers and tailors, the Mint and Chinese laundries and restaurant proprietors. Charcoal costs at present 40 cents, against \$1.50 in past years, per sack of 50 or 65 pounds. Lately the charcoal burners have migrated to the southern forests, and it is a combination between the dealers and burners that is now feared. The men work on shares and in gangs of six or eight. It is thought that some of the Italian charcoal burners will refuse to sign the compact already drawn, making one San Francisco dealer a charcoal monopolist, but the dealers do not propose to take chances, and one is now inspecting woods in various parts of the State, preparatory to engaging men of his own to manufacture charcoal.

FINE COPPER.—A Mr. Clark arrived from Ensenada yesterday, bringing with him some samples of copper ore taken from a mine a few miles below Ensenada, Lower California. The specimens were taken to W. F. McNamara's office for assaying. Only a rough attempt has as yet been made to find the value of the ore, but Mr. McNamara is confident that at the least calculation it will run 50 per cent copper, also carrying some silver. Mr. Clark reports that the mine is easily accessible, and that the ledge is fully eight and a half feet wide. Without having had an assay made, the owners are so confident of the value of the mineral that they are now working two shifts of men. A large Chicago corporation owns a mine near the one from which the samples were taken, and they expect soon to commence operations.—*San Diego Union.*

CARRYING WATER.—Mr. Harris has introduced an ancient Mexican method of transporting water. He has to go three miles for it, and he uses an immense canvas vessel which he throws over his horse's back and carries 35 or 40 gallons at a time. It is three or four feet long and hangs down on each side so as to nearly cover the horse. An opening at the top admits the water and a strap in front and one behind keeps it in place, although it is so heavy that nothing could get it off even when not fastened. The water is drawn off through a hole in the lower corner on each side, stopped by a cow's horn. To open it the horn is pushed back, and when allowed to drop, the water behind pushes it tightly into place and stops the hole entirely.—*Reno Gazette.*

LOBSTERS.—J. D. Redding, Pacific Coast agent of the United States Fish Commission, has been notified that the consignment of lobsters which has been expected for some time will not reach this coast until some time in April or May.

Prison Labor.

The report of the Senate Committee on State Prison and Prison Buildings is one of the most interesting and elaborate documents yet presented. Regarding the abolition of remuneration to convict laborers, the committee say:

We commend the action of the Board of Directors in abolishing the system of remunerating prisoners for their labor at a per diem, and in place thereof substituting a system of rewarding meritorious labor only, by requisitions on the Commissary for certain comforts or materials in addition to those usually allowed; and we recommend a distinct Act, or resolution, forbidding the payment by the officials of a per diem compensation to prisoners for labor. We further doubt the legal rights of the board to allow such compensation.

The door and sash department is commented upon as follows:

The door and sash department has proved to be the most profitable industry in operation at the prison to the State, the net earnings for the 37th fiscal year being the sum of \$23,391.48. The building occupied by the department, in conjunction with the furniture department, cost the sum of \$200,000, and the number of convicts detailed for labor in the department is 160. The machinery in use is owned by the California Door Company. From examination and the clear and explicit explanations of Mr. Ranson, superintendent of the department, the following facts have been ascertained, which are of value in the present consideration of the question of the conflict of prison labor with the interests of free labor, so far as the San Quentin prison is concerned, this being the only department in the prison causing any discussion of moment on that subject. If it is decided to abolish the department, the California Door Company will undoubtedly remove its machinery elsewhere, and employment be given to about 100 free laborers, viz., boys, skilled mechanics, or Chinese, as the company may select, the amount of whose wages would be the sum of \$50,000 per annum, the estimate being that 100 free men will accomplish as much work as the 160 convicts. The price of manufactured articles in this State would not be affected. Hence the consequent advantage to the laboring classes would be the distribution of \$50,000 per annum in wages. The loss to the State would be annual earnings, \$23,391.48, and convicts to the number of 160 thrown out of employment, unless other plans be adopted, as herein suggested, relating to the jute department, and the sum of \$160,000 appropriated therefor. Also the building, valued at \$200,000, would be useless, unless converted into a reformatory or used as a spinning and weaving department for jute manufactory; in either event a sum of not less than \$25,000 would be required to remodel the building. It is with great reluctance that your committee approaches this question, because we find ourselves confronted with two serious propositions; the first being a financial injury to the State of California, by cutting off a source of revenues, and rendering valuable property useless. The second being the declaration of principles opposed to convict labor as enumerated in the platforms of the great political parties of this State, upon which the present members of the Legislature were elected, and which are presumed to be the sentiments of the people of this State. Your committee is divided in opinion on this subject, the opinion of the majority being given in subdivision eight of this report.

The majority of your committee are in favor of maintaining the sash and door department as it now is, for the time being, and for the reason that arbitrary and sudden action in the matter would result in injury to one body of citizens, which would not be compensated by sufficient immediate benefits to any other body. In other words, the financial loss to the State, which must be met by additional taxation, would impose a general hardship which the benefits to be derived from the distribution of a portion only of the sum of \$50,000 per annum to free white labor would not justify in the present condition of affairs. The change can be made, however, gradually, harmoniously, and we trust that more light may be thrown on the subject, that such action may be taken, ways and means devised to accomplish the desired object in due time, after the immediate and pressing necessities of the prison are considered, and in accord with the interests of all concerned. Seven of your committee agree in the above report; two, Messrs. Murphy and Lenahan, being unavoidably absent on other committee work, have not expressed an opinion.

MINING TAX.—According to State Controller Halleck's report for the fiscal year ending Dec. 31, 1886, the gross yield of gold and silver mines of Nevada for the 12 months commencing Oct. 1, 1885, and ending Sept. 30, 1886, was \$6,375,715.82, of which Storey county produced \$2,997,881.84. The State and county tax on the net proceeds of the mines aggregated \$15,491.51, of which Storey county paid \$2468.56.

COLORADO MINING LAW.—In Colorado the State law requires that a locator of mineral land shall, within 30 days after location, do development work to the amount of \$100. If this work is not done, the claim is subject to relocation by other parties. As a consequence, in Colorado all mining locations are worked from the date of location, and no one man holds a lot of unworked claims.

Mining and Scientific Press.

The MINING AND SCIENTIFIC PRESS, published in San Francisco, in its last issue has a valuable and exhaustive article entitled "Mining Review for 1886."—*Foothill Tidings, Nevada Co., Cal.*

The MINING AND SCIENTIFIC PRESS, San Francisco, one of the most reliable mining and milling journals published in the interests of milling and mining, in its issue of Jan. 22d contains a lengthy article illustrating the leaching or lixiviation treatment of ores, setting forth the virtues and feasibility of the process, and in another article commenting on the process, it says: "Although the process of leaching (or lixiviation) ores has long been known, it is only within the past few years that it has attracted so much general attention. Certain classes of ores from which the precious metal cannot be fully recovered by amalgamation, can be successfully treated by this process. The system has been fully described by Aaron and Kustel in their respective books on the subject, and the improvements by Russell, described by Stedefeldt, have added to the interest and value of the process." The *Range* will not hesitate to say that a recommendation from the columns of such a journal as the MINING AND SCIENTIFIC PRESS is of great importance and substantiates that the process is a good one when put to use in a locality like ours where the ores are especially adapted to that treatment.—*Black Range, N. M.*

A SIXTY-STAMP MILL.—It is rumored about town that the Oro Grande Mining Company will soon put up a 60-stamp quartz mill on the Waterloo mine in West Calico, and have ordered the machinery. There is plenty of ore in sight to run a mill of that capacity for years, but the company have only made the plans for the plant, which have been sent to foundries in San Francisco and Chicago. The erection of a mill on the above mine is only a question of time, and as large companies move slowly, it may be months before the mill is erected; but as the ore in the Waterloo is so easily mined and such a large profit can be realized from even low-grade ore, it is most probable that the company will construct the reduction works as soon as possible. When this mill is built then the company's 15-stamp mill near Daggett will be used to reduce the ore from the King mine, and the force of men now prospecting the same will be increased to a number sufficient to extract ore enough to keep the mill running day and night.—*Calico Print.*

SAMPLING WORKS.—The mining business bordering on this valley along its length of more than a hundred miles is essentially of a chloriding nature. There are perhaps a hundred different mines from which ores are being extracted in various quantities and kinds and sent out of the country for reduction. A reliable sampling establishment at some central point on the railroad would do a paying business for itself, and at the same time promote the mining industry wonderfully—with a good concentrating plant it would be just the thing.—*Inyo Register.*

CONTRIBUTIONS TO MINING BUREAU.—The State Mining Bureau has lately received a set of volcanic rocks from Iceland and a set of coal specimens and inclosing rocks from the new coal mine Mark West, Sonoma Co., Cal., from W. L. Watt; rich ore from California mine, Comstock lode, from new ore body discovered late in 1886, from W. H. Patton; silver ores from Calaveras Co., Cal., E. J. Rogers; set of the Stassfurt salts, Jno. Bryant; ores from Coeur d'Alene and Idaho, P. A. Murkson; Arizona ores, J. Z. Davis.

TEMPTING PROVIDENCE.—Though not immediately apparent, there has been a steady increase of arrivals on the Comstock from outside camps, the greater portion being miners in search of employment. While it is desirable and to be hoped that they will all procure work, it is extremely doubtful. The Comstock has quite a sufficient supply of idle miners already, and those in outside camps should be warned that it is only tempting Providence to come here now.—*Virginia City Footlight.*

The citizens of the mining section of Fresno county are in hopes that in the near future the people of the northern part of the county will demand a division for geographical as well as other plausible reasons, with Madera as the county seat. Madera is the shipping point for all of the mining districts in the county that are producing bullion. Over \$100,000 worth of mining machinery, lumber and supplies will be shipped to Hildreth and Fine Gold during the coming year.—*Fine Gold Miner.*

NEW MINES.—There is a new mining district somewhere near Susanville called Diamond Mountain. They have a small mill running that makes a good showing, and several lodes are being developed with excellent prospects. The work has been done by Susanville people in a quiet way. We learn this much from the *Lassen Advocate*.

D. GIROUX, of Winnemucca, who has the mortgage on the Oreana ditch, Nevada, is at work taking the timber out of the tunnel. The ditch and tunnel cost \$70,000, and are a total loss except 15 cars of timber used in the tunnel. It will be shipped to Eureka.

SAN FRANCISCO:

Saturday Morning, Feb. 12, 1887.

TABLE OF CONTENTS.

EDITORIALS.—Saving Floured Quicksilver; A Time and Longitude Indicator; Selling Stock on Margins; A Shield for Boiler Furnaces, 105. Passing Events; Mining Under High Pressure, Conditions; The Vrooman Dynamite Bill; The Lick Telescope, 108. The Monarch Car Mover; Copper in Warren District, Arizona; Legislative, 109.

ILLUSTRATIONS.—Madden's Shield for Boiler Furnaces, 105. Elsie's Canyon, Showing Ore-Bodies in Limestone; Barnhart's Car Mover, 109.

MISCELLANEOUS.—The Reno Reduction Works; The Bounty for Mines, La Mina Cordoveno; Old Placer Mine, 106. Impounding Mining Debris; The Black Range Mines, N. M.; Prison Labor; Mining and Scientific Press, 107. Amending the Patsut Laws; New Alaska Mines, 111.

MECHANICAL PROGRESS.—History and Manufacture of Augers; Life of Cast-Iron Pipes; Ancient Lead Pipe; Exporting Locomotives; A Novelty in Fort Construction; Steel Railroad Ties; Hainmaring; Iron Then and Now; A New Lamp Reflector; Knife Sharpening; Speed of Turbines, 110.

SCIENTIFIC PROGRESS.—Ice, Water, Vapor and Heat; Measuring Electricity; Destruction of Trout by Mosquitoes; Wonderful Operations of Electricity; To Develop the Lungs; Intense Cold Necessary for Some Forms of Vegetable Life; Heating by Electricity; Force in Heat; Varieties of the Lily, 110.

USEFUL INFORMATION.—Distilling Slops for Vine Dressing; Restoring Leather Bindings; Bread Baked by Boiling; The Use of Snakes; Polishing Tool Handles; To Retain Starch in Clothes, 111.

GOOD HEALTH.—Carriers of Contagion; Whooping Cough—What Is It; The Gastronomic Value of Odors; Carbolic Acid in Indigestion; New Help in Surgery; Blood Poisoning from Machine Oil, 111.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Montana, Idaho, Utah, Colorado, Oregon, Washington, New Mexico, 112-13.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 116.

Passing Events.

The close of last week brought an unusual occurrence in this latitude—a veritable snow-storm, which completely covered the hills around the bay, and gave San Franciscans an opportunity for once to indulge in snowballing. Several inches of snow fell in this city and on the adjacent hills.

The Legislature is hard at work and considering many important bills. A summary of what is being done is given in another column.

Up in Nevada county the severe storm has put a temporary stop to mining operations, where the water is depended on for power. Heavy rains have fallen all over the State, to the great delight of all Californians, who were fearing another dry season. As we write—Thursday—the rain is still falling.

The sensation of the hour in the city is the excitement arising from the bomb-throwing at the Grand Opera-house on Wednesday night, in the midst of a crowded audience. Fortunately, the man creating the mischief was the only one hurt. This caps the climax of the dynamite outrages so unpleasantly frequent here of late, and it is the hope of the people that fit punishment will be meted out to all who are detected.

The fears of a dry season are all past, and miners and farmers can now count on a prosperous year.

ELECTRIC LIGHT IN PEARL FISHING.—A Glasgow yacht, destined for pearl fishing in South Australian waters, has been fitted with electrical apparatus expected to light up the water to the great depth of 17 fathoms.

The Bank of California has attached the Spring Valley mine, Oherokee Flat, Butte county.

Mining Under High-Pressure Conditions.

California, measured by population, occupies a very low rank among the States of the Union, her position in this respect giving some color to the argument of those who incline to question the utility of the great gold discovery as a means of increasing the permanent population of the country.

But this argument, so far as it has any force, applies only to those surface placers which, being extremely rich and easily reached, present especial attractions to the hordes of adventurers who first came to California, and who, when this class of deposits had been exhausted, there being nothing left to keep them here, took their departure never intending to return.

But while these shallow diggings, so easily reached and so readily depleted, did so little toward building up and populating the State, they contributed just as little toward developing and laying the broad foundations of that mining industry which constitutes to-day a leading factor of California wealth and one of the great sources of our national prosperity. Not only so, but had these diggings never existed, it may well be that this great industry would have suffered little or no detriment. It may well be that if never a rich gulch, river-bar or shallow placer had been found in all the length and breadth of our gold fields, the business of mining for the precious metals would have been further advanced than we now find it.

If we had had only our deep-lying Pliocene channels, our hydraulic banks, our river-beds and gold-bearing quartz lodes to begin with, it is probable that these branches of mining, on which the future of the industry must mainly depend, would have attained to a larger development and a higher perfection than they have yet reached. Inaugurated as they were, these more stable and enduring branches of the business had to labor under all the disadvantages of high prices, uncertainty and disorder incident to the era of pioneer mining in California. They who then engaged in these pursuits had to begin and build from the top. They had no chance to lay first a firm foundation on which to rear the superstructure. The conditions on which most staying industries are founded were here largely reversed. Instead of beginning on a low plane and expanding little by little, these branches of mining were forced suddenly into existence, the men who inaugurated them being without experience and hardly ever able to obtain skilled assistance. But for the excessive prices, the hurry-scurry, crime and disorder attendant on the working of the shallow placers, all this would have been so different that we may well believe these more underlying branches of mining would have been brought into their present thrifty condition at a much earlier day. And when we contrast the present state of things, characterized by its quiet order, security to person and property, and the sure and ample rewards it brings to both labor and capital, with the tumult, the excitements and the uncertainties of these pioneer times, we consider it no great misfortune that these latter should so soon and so utterly have passed away.

In this our California experience there is supplied another example of the ill effects of beginning a business that it is expected will prove permanent under high-pressure conditions. Mines that commence in bonanza are apt to prove treacherous and short-lived. Had the first finds on the Comstock range consisted of large bodies of medium-grade ore instead of the bonanzas developed there at the start, the great Washoe lode would not probably be reduced to the moribund condition in which we now find it. Certainly its history would have been marked by less of disaster, though the bullion product were somewhat smaller than it has been. A brief career and an ugly ending seem to very often await these extra rich finds, as witness others beside the Comstock that have occurred in the State of Nevada. The Eberhardt bonanza of White Pine memory, one of the richest and for its size one of the most valuable ever found, was dug out in a couple of years. Through its sudden exhaustion the country, which it brought into merited notoriety, has suffered such a setback that both capital and enterprise have avoided it ever since. And yet this White Pine region possesses such mineral resources that, but for this fatal booming it would very likely have been a populous and prosperous mining district to-day. Too much premature blowing

has worked a harm to many promising mining camps. The reaction that comes of disappointed expectation is always damaging. It leaves the subject prostrate and so nearly lifeless that it takes time and labor to restore animation. The real interests of Tombstone, Cœur d'Alene and Leadville, not to instance numerous other localities, have been greatly prejudiced by extravagant claims and overpraising. We consider it matter for congratulation that the mining industry of California having passed the dangerous epoch of bonanza strikes, ounce diggings, stampedes and excitements, has reached that safe and sober stage that so befits the business.

The Vrooman Dynamite Bill.

Senator Vrooman has introduced a bill which is designed to prevent any person not engaged in the manufacture, sale, transportation or legitimate use in blasting operations or the arts, from being able to obtain dynamite, nitroglycerine, vigonite, Hercules powder or other high explosives. It provides that manufacturers or dealers in these substances shall keep an account-book of record of all sales, etc., giving names, quality, destination, etc., which book shall at all times be open to inspection by police authorities. Failure to make such record is a misdemeanor, and subjects the manufacturer or agent to a fine, half of which goes to the informer. The bill provides that unauthorized people having in their possession any of these high explosives under certain circumstances are guilty of felony. The final section of the Act is as follows: "Any person, firm or corporation who shall take, carry or transport, or cause to be taken, carried or transported, any dynamite, vigonite, nitroglycerine, Hercules or giant powder, or other high explosive, into the limits of or through or across any incorporated city or town of this State, or in, through or across any harbor for shipping, in manner, condition or quantity or otherwise in violation of the laws or ordinances of such city or town, or of the laws and regulations governing such harbor, shall, in addition to the penalties provided or imposed by such laws, ordinances or regulations, forfeit to the State of California all such explosive substances, as well as the cases inclosing the same. Such forfeiture may be sued for by any citizen of the State, for himself and the State, and the goods or property, when so forfeited and recovered by judgment of the court, shall be sold and the proceeds divided, the citizen so suing taking one-half to himself for his own benefit and paying the other half into the State treasury."

The general public would be very glad to have all these dynamite assassins punished, and glad to see legislation which would put a stop to the throwing of bombs and firing of explosives. But it does not seem as if this bill would accomplish all that is looked for. It will work serious inconvenience to the manufacturers of high explosives, of which there are a number in this city. On this coast, in mining, railroad and work of like character, vast quantities of high explosives are made and used. It must be transported from the factories to its destination. It seems rather hard to interfere with so important an industry as powder-making in the way proposed. They cannot keep track of every pound of powder sold. If they sell a ton or so to a mine up the country, vicious people might obtain it from the mine, but the powder company could not be blamed. The substances are necessary for certain operations. Most of them are made to order only, and no large stocks are kept on hand by any of the companies. The provisions of the bill are impracticable in the opinion of the powder companies. The law strives to make them responsible for creating the powder. If the law would promptly punish men when caught, the dynamite outrages would soon stop. The few pounds of high explosive needed for such outrages will doubtless be obtained about as easily after the bill is passed as now, while the manufacturer will be put to great inconvenience. The mining community, too, will be troubled by the passage of this bill, as they use large quantities of powder. There should be modifications and amendments to the bill, which would cause less interference with the operation of powder manufacturers and dealers, while at the same time the real object would be accomplished. It seems improper to hamper a great manufacturing interest because a few misguided men use its products to evil ends.

The Lick Telescope.

Its Possibilities Practically Considered.

The people of this State point with pride to the fact that upon one of our mountain-tops will soon be mounted by far the largest refracting telescope in the world. We are very likely to hold this honor for some time to come. The difficulty of obtaining a disk of crown glass of such dimensions as that required for the Lick telescope, was such as to cause the financial ruin of the firm that undertook the task of casting it, and for a time it appeared that success was almost beyond hope; but the nineteenth trial was successful. With such experience, another disk of equal or larger size will probably not soon be again attempted. To produce this grand optical wonder required many thousands of dollars, many years of time, and the best skill of two continents. The elder Clark is now 84 years of age, and this is probably the last great telescope to receive his magic touch, and is the crowning work of his life. No other optician has ever made so many large telescopes; therefore, we need not fear that the telescope on Mt. Hamilton—the pride of our State—will soon be eclipsed by a larger one.

Our citizens, too, look with eager expectancy to the time when the great telescope will explore the depths of space, throwing new light upon many questions brought forward by the greatest of sciences—astronomy.

So much has been said about this telescope, however, that the public has very exaggerated notions of its optical power, as well as of large telescopes generally. For instance, the general public would take it as a matter of course, if it appeared in print, that the Lick telescope would bring the moon so near that it would appear as if only one mile away; or that a city as large as San Francisco could be seen upon the planet Mars; yet under the most favorable possible conditions that can ever be hoped for, even on Mt. Hamilton, with the very highest magnifying power that the great lens will bear, the moon will not be as well seen as it would be with the naked eye at a distance of 300 or 400 miles. Upon Mars, with the Lick telescope, probably as large an aperture as can be employed with favorable results, we could not hope to see the planet better than with the unaided eye at a distance of 25,000 miles. To discover evidences of life is utter nonsense!

It may seem strange to readers who have given no thought to the subject, that in viewing certain bright objects there is a point in size where a comparatively small telescope would give better results than a larger one. Reflecting telescopes can be made of much greater dimensions and light-giving power than the Lick, but it is at least an open question if better views could be obtained of the planet Mars with larger apertures. In the *Observatory* of October, 1885, Mr. W. F. Denning, F. R. A. S., and an astronomer of note, uses the following language:

"* * * 'In the giant telescopes of the future, still less will be seen than in the incomplete views now afforded by the refractors of Chicago and Washington. The belts on Jupiter and the seas on Mars will nearly disappear amid the brilliant, overpowering light from a 10 or 12-foot reflector! There will be blazing disks, affected by incessant molding and flaring, and nearly devoid of reliable markings. * * * Ultimately men will see that they do not want light to look at the sun, nor enormous apertures to increase the turmoil of the air. They will come back to small instruments, and do better with them in studying the surface phenomena of bright planets.'"

If telescopes only increased in power in the same ratio as they increase in size, the Lick instrument would be the king of refractors and would practically have no competitors; but except on faint objects the 8 to 15 inch aperture telescopes prove themselves to be formidable rivals to the larger ones, for, as Mr. Denning says, "what the minor telescope lacks in point of light it gains in definition. When the seeing is good in a large aperture it is superlative in a small one. When unusually high powers may be employed on the former, far higher ones proportionately may be used with the latter."

A 10-inch objective has an area of 79 square inches, while the Lick has 1018, or about 13 times the light-collecting power of a 10-inch, but it would utterly fail to bear 13 times the

magnifying power. Two and one-half, or at most three times, would be the limit of magnifying power over the 10-inch, and then only on rare occasions; for, on what may be termed "poor seeing nights," a 10-inch would do almost as well on bright objects, and neither would give satisfactory results.

Telescopes from 4 to 6 or 8 inches aperture will, under exceptionally favorable conditions, bear a magnifying power of nearly, if not quite, 100 to the inch of aperture; but a practical astronomer would not expect an instrument of 25 or more inches aperture to bear such relatively high powers, for the reason that every defect in the glass (and we cannot expect an objective of 30 or 40 inches to be as perfect as smaller sizes), every vibration of the mounting and every tremor in the atmosphere would be magnified as much as the object observed; and as these obstacles to perfect definition increase with the size of the instrument, it is plain that a point can be reached beyond which it will be useless to go. This is in perfect harmony with the opinion of Prof. Newcomb, one of the very greatest astronomers in the world, who expresses himself as follows concerning the great refractor: "Still, the defects arising from the secondary spectrum are inherent in the latter" (the refractor), "and increase with the aperture of the glass to such an extent that no advantage can ever be gained by carrying the diameter of the lenses beyond a limit which may be somewhere between 30 and 36 inches."

Again, these immense telescopes put obstacles in the way of the astronomer and the mechanic that are scarcely noticed in smaller instruments. Thus, the tube of the Lick instrument will be over 50 feet in length. It cannot be supported at many points throughout its length, but must necessarily be supported at only a single point near the center of its length. With the cell and lens weighing a matter of 600 pounds at one end of the tube, it must yet be perfectly rigid—flexure of a fraction of an inch in any of its multitudinous positions would be injurious to its good performance. Then, too, the contraction and expansion of a tube of metal of such length must be another serious question, for the lengthening or shortening of the tube of only a few hundredths of an inch will require constant readjusting of the eye-piece when using high powers. A single current of warm or cold air could easily produce changes that would have a very serious effect on an instrument of such superlative sensitiveness.

The temperature of the disks forming the objective must be as near as possible that of the surrounding atmosphere to obtain good results, and while this condition may usually obtain, the question of temperature is often a serious one with large telescopes.

However, while we should not let these exaggerated and ridiculous notions lead us, we may still be sure that the great instrument on Mt. Hamilton will give our State a world-wide reputation. Prof. Holden is young, energetic, has great ability as an astronomer, and is ambitious to make a great name for the Lick Observatory; and, while we should rid ourselves of the preposterous ideas that the public seems to have, we may expect that, with a site so perfectly adapted for astronomical research as Mt. Hamilton, and a telescope which seems to be as large as there is any use to make them, that the greatest hopes of astronomers—if not the public—may be fully realized.

There are two important branches of astronomical research, however, in which the Lick telescope stands head and shoulders ahead of all other refractors, namely, faint objects and stellar photography. This great telescope will bring into view thousands of stars that in the 30-inch belonging to the Russian Government, and in other large telescopes, will be entirely invisible; and having a third lens to transform it into an enormous camera, it is without a rival worthy of the name. This latter improvement alone will make it by far the most valuable instrument in the world, and will immensely increase the number of known stars, besides furnishing data for the study of stellar parallax, variable stars, and it will probably add more to our knowledge by this means than by any other work in which it could be employed.

The Redding foundry is working up quite a trade in the casting of shoes and dies for quartz mills.

The Monarch Car-Mover.

All who have had to move railroad cars at stations or side-tracks, when loading or discharging them, know how difficult it is to do so with the ordinary pinchbar. The "dead weight" of the car has to be overcome each time after they get a new hold, and the "give" or play of the trucks causes a lost motion of at least half the distance that ordinary devices can move the car. There are so many places where cars have to be moved without the aid of engines that an efficient mechanical appliance for the purpose has long been needed.

Barnhart's car-mover, illustrated by the cut on this page, is a new device by which a continuous pressure can be exerted on the rear end of the car so that it can be readily moved. The

BARNHART'S CAR MOVER.

device is quite simple in construction and operation. When the handle is raised the lower leg grips the rail, holding its position, while the center bar is moved forward, propelling the car, and the upper leg moves forward and up to the lower leg. When the handle is lowered, the upper leg holds its position, the center bar continues to move the car forward, and the lower leg, now released, moves forward away

work. Mr. G. S. Suider, of 312 Mason street, this city, has the patent rights for California and Oregon, which he is desirous to dispose of to an individual or company. The appliance is one of those useful American inventions for labor-saving and convenience which once seen in operation will be readily appreciated.

Copper in Warren District, Arizona.

The principal mines of the Warren district, Arizona, are found in limestone of the lower carboniferous age. The Mule Pass mountains are a short distance east-and-west range, produced by the upheaval of the lower carboniferous material, which overlies the huge mass of eruptive rock. The accompanying engraving from Mr. Wendt's paper, before the Institute

rarely shown as completely as in the principal copper mines of this district, and it seems to have been accompanied at the same time by a deposition in the adjacent country rock, which now forms the walls of the veins, of both silica and alumina, and more or less copper. At one point in the Copper Queen some 200 feet below the surface, the walls of the ore body are well defined, perfectly smooth, and separated from the hanging-wall by a clay gouge some two inches thick. The clay gouge readily flakes off from the smooth hanging-wall, and the wall itself is decolorized and stained almost black. Samples taken from this wall carried one per cent copper and considerable iron, alumina and silica.

Legislative.

Considerable time has been devoted to the discussion of the Goncher bill, providing for an appropriation of \$125,000 for the State Mining Bureau. The committee reported in favor of \$60,000, but an amendment has been adopted, reducing the appropriation to \$30,000. The main obstacle to its passage within the past few days has been the obstinate fight made by Senator Clunie to have incorporated in the bill a clause making it obligatory on the part of the Controller to pay out of the appropriation about \$1900, which ex-State Mineralogist Hanks had borrowed from Wells, Fargo & Co. The exact amount of indebtedness of Mr. Hanks to the banking firm is unknown, and a decided opposition was manifested to establish a precedent making the State liable for any debt contracted by officials. Wells, Fargo & Co. advanced certain moneys to the institution some time since, with the expectation of being repaid by the Legislature.

The section added, at the suggestion of Caminetti, to Wright's irrigation bill, will protect the mining industry, and reads as follows: "Navigation shall never in any wise be impaired by the operation of this Act, nor shall any vested interest in or to any mining water rights or ditches, or reservoirs, or dams, or in or to any water or water rights, reservoirs or dams, now used by the owners or possessors thereof, or by persons purchasing or renting the use thereof, or in or to any other property, now used directly or indirectly in carrying on, or prompting the mining industry, ever be affected by, or taken under its provisions, save and except that rights of way may be acquired over the same."

Senator Walrath's bill authorizing the construction of dams for impounding debris, has been amended in committee by requiring the plans of the dams to be constructed, to be approved by the State Engineer, or in the absence of such officer by a competent engineer to be appointed by the Governor. We give this bill in full in another column.

Goucher introduced a bill amending the political code, authorizing trades unions and labor organizations to adopt a trademark and affix it to goods manufactured by them. The code is made applicable to the trademark, and punishment is prescribed for counterfeiting.

The Committee on Labor and Capital reported in favor of the passage of the bill (414) to protect the health and regulate the hours of labor of streetcar conductors and drivers and grip-men.

Ohleyer's bill declaring hydraulic mining a felony had its enacting clause stricken out, and was by this means killed.

The bill which gives a fixed income to the University of California has passed both houses, greatly to the joy of the friends of that institution.

The anti-dynamite bill introduced by Senator Vrooman is referred to elsewhere in this number of the Press.

The San Francisco Copper Mining Company, which has been operating at Spenceville, in this county, for a number of years, makes a regular monthly output of 25 to 30 tons of cement copper. The same company is also operating at Campo Seco, Calaveras county.—*Grass Valley Union.*

Now is the time of year when large, rich quartz ledges are discovered and fortunes made, with the jaw of the man who sits around warm fires with his feet on the stove.—*Placerville Observer.*

The Old Guard mine, near Benson, Arizona, has been sold to English capitalists.

BISBEE CANYON, SHOWING ORE-BODIES IN LIMESTONE.

from the upper leg. The alternate raising and lowering of the handle thus gives the machine a continuous walking motion, and so in addition to the great lever power, the motion itself, or inertia of care when once started, helps materially, as there is no "dead weight" to overcome at each stroke. The lower end of the legs are shod with steel and rest astride the rail, fitting any size. The device will move "dead" engines in roundhouses or repair shops. It will act on up-grades or curves and keeps the car in constant motion as long as desired.

This little apparatus does away with vexatious loss of time and expense in waiting for shunting engines. It is useful for placing cars just where they are wanted at railway sidings, freight sheds, warehouses, gravel pits, quarries, coal or lumber yards, wharves, mines, limekilns, foundries, factories, etc. Very little strength is required to operate this, the leverage being so powerful. It would seem that this device could be utilized instead of "jacks" in moving the heavy logs of this coast on the "landings" in the woods, as it keeps up a continual pressure and does not have to be moved or lifted each time a new hold is taken. Its special usefulness, however, is for railroad

work. Mr. G. S. Suider, of 312 Mason street, this city, has the patent rights for California and Oregon, which he is desirous to dispose of to an individual or company. The appliance is one of those useful American inventions for labor-saving and convenience which once seen in operation will be readily appreciated.

of Mining Engineers, illustrates the character of deposition of ores in these rocks. The limestone forms the south slope, and the eruptive rock the north slope of the canyon. In the deep workings of the Copper Queen (in the southerly canyon) on the 400-foot level, the top of a mass of eruptive rock has been found, which has been microscopically determined by Dr. A. Julien to be a felsite porphyry.

In this district, as in Clifton district, a distinction can be made between veins and ores found in the limestone and those in the silicious and eruptive rocks.

The copper ores in Warren district all occur in true fissures, and the two principal mines, the Copper Queen and Copper Prince, present great similarities, and in every particular carry out the description of "bed veins" given by Cotta. The outcrop of the ore starts between the bedding of the limestone, and, as Cotta remarks, the ore bodies might be mistaken for orebeds, and not bed veins, were it not for the presence of spurs in the walls.

The figure given illustrates this structure. The spurs in these ore deposits usually follow the planes of bedding of the limestone. The limestone generally occurs in blocks, and the ore then follows the plane of bedding until it comes to a cross seam from one bed to the other, when the ore will sometimes jump to the next seam. In places, the seams are several inches or even a foot wide. In other places, what have evidently been caves or vugs in the limestone, have been filled by the ore. Not all the caves near the ore bodies contain ore.

The deposition of copper from a liquid is

MECHANICAL PROGRESS.

History and Manufacture of Augers.

The principle of the auger now in use all over the world is said to have been discovered by accident. In 1680 Benjamin Pugh, an Englishman, while watching some boys working endeavoring to bore a hole in the ground with a piece of iron barrel hoop, noticed that after the hole had been sunken some distance into the earth, and the pliable metal of their improvised tool had become heated, it twisted and carried the dirt up to the surface nicely, and he could not see why the same principle should not apply to wood. The invention of the auger was the result.

The screw-auger is an American invention, and was invented about 100 years ago by Thos. Garrett, who lived in the vicinity of Oxford, in Chester county, Penn., where most of the black augers are still made. Most of the bright tools are made in the East, but one of the principal manufacturing is in Philadelphia. The old-fashioned pod auger is still used in England and Germany. The single-screw auger is also an American invention, and was discovered by accident by a Philadelphian. It is the only auger that can be used to any satisfaction in very hard woods, where the double-screw augers become clogged.

In the olden time, and until less than 50 years ago, the feature of any manufacturer was the excellence he could produce in quality, and as nearly everything was made by hand, it did not receive the beautiful polish that, at the present day, adorns the cheaper and inferior implements. In preference to a polished surface the inventor and manufacturer of double-twist augers made the twist black and unpolished. It thus showed the handwork that had been put on it, and it is still a well-known fact that hand-made tools are far superior in quality and workmanship to all others. As manufacturing industries increased, augers began to be made with a high polish and heavy, but the consumer soon found they were of inferior quality, and would inquire for the black-twist auger, knowing it to be the old-fashioned genuine kind.

Its Manufacture.

Although every one is perfectly familiar with this commonplace tool, but comparatively few know the process of its manufacture. In making augers the iron which forms the main or spiral part is welded into the steel of which the tip is made before forging. The bar is then put under hammers and forged into shape. It is then put into what is called a "wringing machine" and twisted up in a rough state into the spiral form, after which it is passed through "crimpers," giving a uniformity of twist. The augers are next put through "straighteners" and revolved, making them perfectly straight, when they are ready for putting on the head, which is the most delicate operation in their manufacture, and requires the work of a skilled artisan. They are then subjected to a "grinding-out" process, which consists of putting them through two rubber wheels to rough-polish the twist. The "fitter up" then takes hold of them and "lightens" or fits the head; then the fliers file down and sharpen the heads, after which they pass through the hands of the polishers, where they are polished and hardened ready for market.

LIFE OF CAST-IRON PIPES.—The fact is well sustained that the wear and tear by rust in uncoated cast-iron pipe exposed to the action of clean, fresh water on both sides is not more than one-eighth inch in three generations. With the present method of protecting such pipe with asphaltum, the life of the ordinary cast-iron pipe used in building construction may be greatly prolonged; indeed, even an ordinary coating of coal-tar pitch, when properly applied, is sufficient to add at least a score or two of years to its durability. The life of a soil pipe, even when quite thin and uncoated, has been found by experience to be so great that it is not unreasonable to suppose that the greasy matter contained in sewage serves to coat and protect the iron from the corrosive action of the water and the acid component of the sewage. The defects and leakages more generally met with in such pipes are caused by the defective manner in which the joints are made, and improper placing and securing.—*London Ironmonger.*

ANCIENT LEAD PIPE.—Although the production of lead pipe has commonly been regarded of quite modern origin, there appears to be evidence that the Romans were acquainted with the article, without, however, possessing the appliances for fabricating anything of large dimensions or efficiently strong to withstand any very great pressure. In the Chertwell Museum is a piece of lead piping made by rolling a sheet of metal, turning the edges over and then running molten lead along the joints.

EXPORTING LOCOMOTIVES.—Nearly one-fourth of all the locomotives built at the Baldwin Works, during the last 10 years—900 out of a total of 4000 built—have been exported to foreign countries. This is a most interesting fact, and speaks volumes for the skill and enterprise of American mechanics. The Baldwin locomotives secure these markets by reason of the superiority of their engines, as well as because the price is lower, and both of these results are obtained without paying the low prices

for labor that obtain in the English shops. It is in this direction that we must look for export trade, superior work at the same or less prices, the result of better labor, better appliances and better methods. Such trade will be dearly bought if it is the result of lower tariffs and reduced wages.

A Novelty in Fort Construction.

Sir Henry Bessemer has proposed quite a novel method for the construction of armored forts. He would manufacture the steel plates directly upon the ground. Writing to the *London Times*, he suggests that he would obviate the enormous expense of ordinary armor plates for forts, by casting *in situ* the whole face of a fort or complete turret in one solid piece of steel, with all its ports and loop-holes properly shaped and formed in the act of casting. He says: Let us take as a simple example the production of a fort with a curved face of 100 feet in length, 16 feet high and 3 feet in thickness, such a plate would be molded after the manner practiced in ordinary iron foundries—that is, with brick walls held together with iron binders and internally lined with fire-clay.

Alongside this mold would be placed the melting cupolas and four fixed 20-ton Bessemer converters, each capable of turning out 18 charges per day of 24 hours, thus delivering into the mold one ton of molten steel per minute. At this rate of working the mold would be filled in 16 hours, and produce a single plate weighing 960 tons, requiring no backing or superstructure for its support, and no expensive fitting together of separate parts. The ordinary technical difficulty to be encountered from the static pressure in the mold tending to burst it open would, in this system of slowly filling the mold, be extremely small, owing to the fact that the metal will solidify at the lower part, leaving only a half foot or so fluid at the upper part. It will be equally obvious that it would be quite impossible to destroy such masses of steel as could be produced by any existing artillery, while the price which such castings would cost at a time when we can purchase finished steel rails at £3 15s. per ton will be readily understood. Sir Henry Bessemer, in conclusion, reminds the Government that he has long since ceased to have any pecuniary interest whatever in steel manufacture, but offers to afford them any information.

STEEL RAILROAD TIES have not yet passed quite out of the experimental stage, at least not in this country. An examination of the steel sleepers made by the Barrow Hematite Steel and Iron Company, and laid by the Northeastern Railroad Company, of England, in March, 1885, has been made, and the result is said to have been in every way satisfactory. The inspector is of opinion that the sleepers will keep good for 20 or 25 years, whereas the old-fashioned wooden ones only lasted from 12 to 14 years. But when the fact is taken into account that steel sleepers cost more than twice as much as the wooden ones, their economy is at least doubtful. The wooden sleepers cost less for transportation and are not so troublesome to lay; but when once in place the steel ones give less trouble. Steel sleepers are an undoubted success in India, however, from the fact that insects are there very destructive to wood, especially when upon or in the ground.

HAMMERING.—There is a difference in the driving effects of a light hammer when compared with the blows of a heavy one, or a rusty machine bolt would not remain to be riveted up all out of shape when a six-pound sledge will take everything before it. The driving effect from any source seems to require time to act in order to extend a great way into the material. This is noticed in heading up a rivet, where the metal can be worked down into a cone-shaped head by the upsetting effects of a sharp blow, which will be crippled at once under the crushing force of a sledgehammer.

IRON THEN AND NOW.—It is often observed that iron of recent make rusts and wears away much more rapidly than samples made 40 or 50 years ago. The more rapid deterioration of much of the iron of a late make arises from the fact that it contains more impurities than formerly. The common iron of to-day is filled with slag, and looks coarse and fibrous when rusted or worn. Fifty years ago the iron made in the United States was largely charcoal iron, and was much purer and better than the same grade made at the present day.

A NEW LAMP REFLECTOR.—In the course of some experiments made under the direction of the Northern railroad of France, it has been discovered that soft steel plates can be covered by a process of rolling with nickel, and so effectively as to render them as valuable for lamp reflectors as silvered copper.

KNIFE SHARPENING.—To hone a jack-knife, raise the blade on the back from the bone. It takes the polish off to lay the blade down flat; and leaves too thin an edge to stand the hard usage required. The delicate polish that the bone will not imitate is "set" with walrus-hide wheel fed with rottenstone.

SPEED OF TURBINES.—To get a good working speed for a turbine, allow the wheel to run free for awhile and then reduce its speed one-third. Fifty per cent is an allowance that will only work when there is no hindrance to the flow of water or resistance through the wheel.

SCIENTIFIC PROGRESS.

Ice, Water, Vapor and Heat.

The quantities of heat inherent in water, in its three different conditions, are as follows:

1st. Crystallized water (i. e., ice) contains 40 degrees of latent heat. The properties of water, physically considered, when in a state of ice, resemble those of other solid bodies—in this respect, that its atoms are in close contact, having strong cohesive powers, and are incapable of motion or change of position, *inter se*.

2d. Liquid water contains 140 degrees of heat. In the state of liquid, the immobility of water is changed to mobility, with a strong attraction among its several atoms and particles.

3d. Gaseous or aerified water (i. e., vapor) contains 1000 degrees of heat. In the state of vapor, attraction and mobility give way to atomical repulsion and divergence, the immediate effect of which is diffusion. And the element of mutual repulsion between the atoms, combined only in opposition to gravity, is a leading characteristic which must be studied by every proficient master steam fitter.

On heat being applied to a body of ice, the cohesive property of the constituent particles, which come into contact with it, is lost. The particles separate from each other, and, falling from the mass, by the force of gravitation, form a liquid. If heat be continued, such of the watery atoms as may receive an additional unit will assume the vaporous state; and as it had previously received its full complement of latent heat, the additional unit will become sensible, or available heat. A vapor atom may, therefore, be described as the union of one atom of liquid with three units of heat—say two of latent and one unit of sensible heat.

We have numerous works, some of very high authority, essaying to explain the generation of steam; but it is remarkable that no one has yet clearly and satisfactorily explained what is vapor (which steam so closely resembles), how and where it is formed, what really are its special properties, in what does it differ physically and dynamically from liquid water, what are the exact relative proportions of latent and sensible heat in either, and what relation has vapor to electricity.

Heat is diffused or communicated by conduction and radiation. When it passes slowly from one portion of matter to another, in contact with it, it is said to be conducted; and the process, in scientific language, is termed the conduction of the caloric. Metals are the best conductors, then liquids, and lastly, gases. Gold, silver and copper are the best conductors among solids; glass, bricks and many stony substances are very bad conductors; and porous, spongy substances, as charcoal, hair and fur, are the worst. Clothing for cold weather should be made of bad conductors, so that the heat of the body may not be conducted quickly to the surrounding atmosphere. Furnaces, where great heat is required, are built with porous bricks, to prevent the escape of heat to adjacent bodies.

Fifty-five degrees (Fahrenheit) is reckoned moderate heat, and 76 summer heat (in the most civilized latitudes); 98 degrees is the heat of the blood in the average of healthy men.

MEASURING ELECTRICITY.—Ampere, who discovered many laws in regard to electric currents, writes concerning some of the special characteristics of that element as follows: A current of electricity acts almost exactly like a current of water flowing in a pipe. We shall make hardly a practical mistake if we think of it as a current of liquid. Edison speaks of it as "the juice." Just as a liquid needs a "head" to make it flow, so a current of electricity has a "pressure" or "tension" or "electromotive force," always written E. M. F., which makes it flow. As you measure the head of water in feet, so the pressure, tension, or E. M. F. of the electric current is measured in volts. (From Volta, who discovered the electric battery.) Now as a current of water may have a high head, with but little water, and yet exert great power, like a mountain stream, so an electric current may have great tension, a large number of volts, and yet contain little electricity. Lightning is a good example of enormous electric tension with but very little electricity. On the other hand, we may have a low head of water, and a great powerful stream flowing, like a river, so the electric current may have a low tension, pressure, or E. M. F., and yet contain an enormous quantity of electricity. Or we may have both a high head and a large quantity of water—a Niagara falls—and similarly a high pressure and a large quantity of electricity. Then there will be practically two kinds of electric currents of high and low pressure. Now just as we distinguish between the head of water and the amount of water flowing—so in electricity we distinguish between the pressure—the volts, and the quantity of electricity flowing, i. e., the current itself. As we measure the water current in gallons, so we measure the electric current in amperes.

DESTRUCTION OF TROUT BY MOSQUITOES.—A recent bulletin of the United States Fish Commission contains the following interesting account: "In the middle or latter part of June, 1882, I was prospecting on the headwaters of the Tumichie creek, in the Gunnison valley, Colorado. About 9 o'clock in the morning, I sat down in the shade of some willows that skirted a clear but shallow place in the creek.

In a quiet part of the water, where their movements were readily discernible, were some fresh-hatched brook or mountain trout, and circling about over the water was a small swarm of mosquitoes. The trout were very young, still having the pellucid sack puffing out from the region of the gills, with the rest of the body almost transparent when they swam into water lighted up by direct sunshine. Every few minutes these baby trout, perhaps to get the benefit of more air, would come up, so that the top of the head was level with the surface of the water. A mosquito would then light down and immediately transfuse the trout by inserting its proboscis, or bill, into the brain of the fish, which seemed incapable of escaping. The mosquito would hold its victim steady until it had extracted all the life juices, and when this was accomplished, and it would fly away, the dead trout would turn over on its back and float down the stream. I was so interested in this before unheard-of destruction of fish that I watched the mosquitoes for more than half an hour, and in that time over 20 trout were snatched dry and their lifeless bodies sent floating away with the current. I have been unable by inquiry to ascertain if others have observed a similar destruction of fish. From this observation I am satisfied that great numbers of trout, and perhaps infant fish of other varieties in clear waters, must come to their death in this way; and if the fact has not been heretofore recorded it is important to those interested in fish-culture."

Wonderful Operations of Electricity.

Every current and portion of the electricity in nature, says a contemporary, is occupied in a useful work, and a particle of it cannot be employed for the purpose of operating any of the contrivances of persons. A person is compelled to obtain a current for his own use from a decomposition of substance. No matter what the use, a current cannot be borrowed from nature to operate with. A perfectly independent operation of the two currents is performed, and without the slightest interference with each other's work, unless a particular purpose is to be accomplished by it. A current obtained by the operations of a galvanic battery or a dynamo is given a particular work to perform. It is always obeying its office, and it cannot be given another office to perform. A current generated by a battery will do only a decomposing of substance and placing its parts where they are most appropriate.

A current generated by water will only operate in water. A current generated by a fire will operate only in a fire. A current generated by a substance of natural decomposition will only assist in decomposing substances in a natural way. A current generated by a plant while it is living will only assist in the growth of plants. A current generated in a body of a creature will only assist in constructing cells and performing the operations of the body. A current generated in a fold of a brain will perform only a particular intellectual work. A current in a nerve will perform only a power in such organ. A current in an ocean will only whirl water of the ocean. A current in a tide will actually cross one in a sweeping current of water of the ocean and without in the least disturbing the velocity of the water. The current a world discharges will only construct hills and plants, and hold objects on the surface of the earth. A current of the sky is only creating heat and light for the earth. And in every operation of a current of electricity a particular work is performed, and it is of no consequence whatever whether another current is operating in the same place at the same time.

TO DEVELOP THE LUNGS.—If a person's lungs are not well developed, the health will be imperfect, but the development may be increased several inches in a few months by daily outdoor runnings with the mouth closed, beginning with 20 yards and back, at a time, increasing 10 yards every week, until 100 are gone over thrice a day. A substitute for ladies and persons in cities is running upstairs with the mouth closed, which compels very deep inspirations, in a natural way, at the end of the journey.

INTENSE COLD NECESSARY FOR SOME FORMS OF VEGETABLE LIFE.—A marine alga of the Arctic regions grows at a temperature far below zero, and its spores disappear at a higher temperature. It thus appears that intense cold is necessary to the existence of some forms of vegetable life, together with extreme dryness, and this class of plants probably include the cryptogams of red snow.

HEATING BY ELECTRICITY.—Among the late French novelties is an electrical heating stove. In it the conducting wires are led through apertures in plates of refractory clay and plumbago, in which wire hobbins are placed as part of the electric circuit. The hobbins are heated by the passage of the current, and in turn heat the air which is allowed to pass freely through the apparatus.

FORCE IN HEAT.—The amount of force exerted by heat and cold in expansion and contraction of metal is equal to that which would be required to stretch or compress it to the same extent by mechanical means.

VARIETIES OF THE LILY.—Up to the present time 71 species of lilies have become known, according to an English botanist, H. Elwes.

Amending the Patent Laws.

There is a bill pending in the House of Representatives at Washington, providing for such an amendment of the patent laws, that no suit for infringements of a patent can be brought in any Federal Court unless the amount involved or damage alleged to have been sustained exceeds \$200. The pretended purpose of this bill is the protection of farmers and others who are innocent purchasers of goods which infringe the right of patentees. The passage of laws for the prevention of frauds is, of course, desirable, but legislators are in duty bound to see that in attempting to redress one class of wrongs, other wrongs may not be perpetrated. The sole purpose of patents is the encouragement of inventions calculated to promote the general good. The inventor is ordinarily poor. His mind is more or less in the realm of the ideal. His brain evolves a mechanical principle. His hands fashion what his brain evolves. What was inspiration becomes to him demonstration. To the perfection of his mechanical creation he devotes time, labor, money; he sacrifices personal comforts and social enjoyment; and sometimes he is brought face to face with possible starvation. For the protection of mechanical property thus created, all civilized governments have enacted patent laws. The Government of the United States has been especially watchful in the interest of the inventor. It has thrown about him theegis of its protection. It grants him exclusive proprietorship in his mechanical idea for a period of 17 years. Why should there be any letting down in governmental guardianship of his rights? A patented article worth less than \$200 may be just as valuable, relatively, to the inventor as one worth \$50,000 to some other inventor. If any class has been victimized by purchasing illegally manufactured goods, the fault can probably be traced to their own neglect. All patents are publicly recorded. The presumption of the law is that this record is known and read by all men. If it is not, the fault is not in the written and printed record.

The rules and regulations of the Patent Office have in the main operated satisfactorily. Inventors, manufacturers and consumers understand them. They should not, in any important respect, be disturbed. The proposed bill would be a radical disturbance, and is not demanded by public sentiment nor the general welfare.—*Industrial World*.

New Alaska Mines.

Some of the richest quartz we have ever seen came from the new discoveries in the Berner bay region. These discoveries are sufficiently extended to give assurances of a very extensive gold field, and the *Alaskan* will miss its guess if there be not some mines developed there which will lay way over anything of which we have present knowledge—which will severally outdo even the great mine on Douglas island in the value of their output. A large number of claims have been taken up, and there is a reasonable certainty of one or more mills being erected the coming summer. The development of this new district, together with the opening of new mines and erection of new mills on Douglas island, is destined to make Juneau one of the richest and most prosperous mining towns in the United States. Indeed the place can no longer be regarded as a mere mining camp. It is taking on the airs and improvements of a full-fledged city; new buildings, and of a much better class, are going up in all directions, water-works which afford an abundance of pure water for domestic use, and also for protection against fire, have been put in, and altogether Alaska's commercial and mining metropolis wears an air of solid wealth and growing prosperity which argues well for a glorious future. The town bids fair to more than double its population within the coming year, and should the mining interests of which it is the center develop even in a fractional ratio of what may fairly be expected of them, it won't be long till she numbers her people by as many thousands as she now has hundreds.—*Alaskan*.

OUR EXTENSIVE DEPOSITS of bituminous limestone, it is expected, will be largely utilized at no distant date. Experiments with the material have proved that it will be a formidable rival of cement and artificial stone in the innumerable uses to which those materials are put. It seems specially adapted for sewer pipe, possessing great tenacity and durability, and for reservoirs, cellar and warehouse floors, sidewalks and the like it would have no superior. The deposits are said to be very extensive and easily developed and the material is worked with great facility. We hope to see this a prominent industry of the county.—*San Luis Obispo Tribune*.

The new mill recently erected, about four miles east of the Mountain House, by Messrs. Cowan, Crisler and Decker, of Carson, has been closed down for the winter. The mine, however, will be worked, and operations at the mill will probably be resumed early in the spring. It is understood that the ore worked at the recent run paid well.

At Pratt's South Camp, near Wellington, Douglas county, Nev., says the *Genoa Courier*, Pratt's two-stamp mill commenced crushing ore about two weeks ago, but on account of the severity of the weather, the water pipes having been frozen up, causing considerable delay, no important cleanup has yet been made.

USEFUL INFORMATION.

Distilling Slops for Vine Dressing.

We clip the following interesting information in regard to an economical use of distilling slops from the *St. Heloa Times*.—We witnessed the other day at a prominent distillery near this town the utilization of distillery slops, namely, the process of extracting the argols contained therein, from which cream of tartar is manufactured. So far, we understand, this valuable refuse of the distillery has been allowed to find its way through the gutter to the creek, not even has it been used as a fertilizer, notwithstanding the fact that it contains the sum and substance found in the vine and its fruit.

The proprietor, who is bound to find out whether or not it will pay to utilize distillery slops as stated, now makes a trial to that end, keeping a strict account of all labor spent until the argols are all ready for the market. It requires no investment of capital, inasmuch as all tanks and other utensils used are always on hand at a distillery or cellar.

The process of crystallization is as follows: The liquid in question, which constitutes the residue of the wine sediment or piquet after all spirits have been extracted, is led, hot, into low tanks in which a number of grain sacks, cut in two lengthwise, are vertically placed, fastened above to a rope or a rod to keep them in that position. During cooling of the liquid the process of crystallization goes on, the argols forming themselves and accumulate on the sacks placed there for the purpose.

Another way, in place of sacks, to facilitate crystallization, is to use brush, which is put in the tank in bundles. When the process is over the crystals are freed therefrom by shaking, while the sacks have to be scraped and washed in water. The brush is used to advantage because the more surface is obtained on which the crystals settle—it also saves labor. The liquid now remaining is a good fertilizer. We were convinced of the fact when the proprietor showed us a tract of land in his vineyard where these slops had been applied, there was a rich vegetation, while not far from there, where it had not been applied, no vegetation to speak of had shown itself.

RESTORING LEATHER BINDINGS.—Mildew, which shows itself in the form of roundish or irregular brown spots, cannot be cured, but its development may be effectually checked by thoroughly drying the volume and afterward keeping it away from damp. In many cases the leather bindings of old books will be found to be dilapidated. Should they be broken, rubbed or decayed, plaster the part with paste to fill the crevices; then take the yolk of an egg, heat it with a fork, and apply it to the leather with a sponge, having first cleansed it with a dry cloth. To produce a polish surface, a hot iron must be passed over it. If it should be found advisable to remove stains of any kind from the interior or exterior of a book, observe that in the case of common writing ink, the best purifier is a mixture of spirits of salt and water in the proportion of one to six. A solution of chloride of lime is also good, and in both cases the part should subsequently be well washed with clean water. Grease or wax spots are easily removed, either by direct evaporation, which is accomplished by holding a hot iron close to the place affected, or by washing it with ether or benzine. To complete the latter process it is advisable to use the iron as in the former instance. The remedy against oil stains is sulphuric ether. If the stains are extensive, roll up the leaf to be operated on and insert it in a flat-mouthed bottle, half full of the ether, and shake it quietly up and down for a brief period. On removal, the stains will have vanished, the ether rapidly evaporates from the paper, and a little clear water is then all that is required.—*From Book Lore*.

BREAD BAKED BY BOILING.—A writer in a housekeeping journal says: Bread can be boiled instead of baking it, and with far less heating of the range. Those who have tried the new method consider it to be quite satisfactory. It consists mainly in steaming the dough instead of cooking it in the oven. It is claimed that this is a great invention, as it saves the time and experience necessary to get the oven to the right heat for baking, which has always proved the great obstacle to baking at home. The utensils required are simply these: First, a tin mold, or camp-kettle, in which the dough is placed after it has been mixed with the usual ingredients—water, yeast, sugar and salt—and, secondly, a larger tin saucepan, into which the mold fits. The water in the outer saucepan is allowed to boil around the tin mold for two or three hours, the lids of both utensils being kept closely down, and at the end of that time the loaf may be turned out. It will be found firm, solid and pliable, with all the qualities of good bread.

THE USE OF SNAKES.—Persons who dislike snakes, says the *New Orleans Picayune*, continually ask: "What is the use of them?" That they are not without use will, I hope, appear in the course of this work, were it necessary to preach that all things have their use. But in one habit that offended Lord Bacon, namely, of "going on their belly," lies one of their greatest uses, because that, together with their internal formation and external covering, enables them to penetrate where no larger car-

nivorous animal could venture, into dark and noisome morasses, bog jungles, swamps, amid the vegetation of the tropics, where swarms of the lesser reptiles, on which so many of them feed, would otherwise outbalance the harmony of nature, die and produce pestilence. Wonderfully and exquisitely constructed for their habits, they are able to exist where the higher animals are not, and while they help to clear those inaccessible places of the lesser vermin, they, themselves, supply food for a number of smaller mammals, which, with many carnivorous birds, devour vast numbers of young snakes. The hedgehog, weasel, ichneumon, rat, peccary, badger, hog, goat, and an immense number of birds keep snakes within due limits, while the latter perform their part among the grain-devouring and herbivorous lesser creatures. Thus beautifully is the balance of nature maintained.

POLISHING TOOL HANDLES.—The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a nice appearance by French polishing; but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub with a new cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preservative action on the wood.

TO RETAIN STARCH IN CLOTHES.—It may not be generally known that after clothes are starched in the usual manner, if they are passed through a bath of chloride of zinc heated to about 60°, the starch will be held through several successive washings and will suffer no change by being exposed to the dew or rain.

CARBOLIC ACID is now recommended for moistening the tools with which metals are worked. The efficiency of the grindstone is even said to be increased by the use of acid. The dark and impure acid can be used for this purpose.

TO TAKE PAINT SPOTS OFF OF WOOD, lay a thick coating of lime and soda mixed together over it, letting it stay 24 hours; then wash off with warm water, and the spot will have disappeared.

THE demand for tubing and piping for natural-gas purposes is so heavy that prices have been advanced.

GOOD HEALTH.

Carriers of Contagion.

How Poisonous Particles are Carried from Place to Place.

To mention a few of the modes of contagion, I have to speak, in the first place, of towels, especially of that abominable institution known as the roller-towel, which has been used so much in asylums where 40, 50, or more children use the same towel, whether they have granular lids or not. True, in a great many of these cases the existence of granular lids was not known; but even in cases in which the existence of the disease was evident, the ignorance or carelessness of the persons in charge has allowed transmission by towels to be one of the most frequent sources of contagion. As a carrier of the contagion the housefly plays an important role, especially in cases of young children who are not able to protect themselves against the visits of this little animal. Attracted by the sweetish odor of the discharge, it will settle on the eyes of children affected with the disease, especially infants, and carry the contagion in its claws to the other eye or to the eyes of sleeping infants.

Spectacles may be the carrier of the contagion. I remember the case of a young lady who could not explain satisfactorily how she came to have granular lids. Upon her return to school she mentioned that she had granular lids, whereupon one of her classmates said: "Why, that is the disease which I have been suffering from for the last six months." This classmate was near-sighted, and used glasses. My patient was also near-sighted, but had not used glasses, and whenever she wanted to see anything at a distance she was in the habit of borrowing the spectacles of her friend, and there is no doubt in my mind that this was the means of carrying the poison from the classmate's eye to the patient's eye.

Children with granular lids are very apt to rub the eyes, because the secretion as it begins to dry on the edge of the lids causes an irritating, itching sensation. They will now play with other children, and from their hands transfer the poison to the hands of the other children, and these latter rubbing their eyes contract the disease. Handling objects which have been used by granular-lids patients may be the means of carrying the contagion. A young lady who volunteered to teach children affected with granular lids, and who had been isolated from other children in a certain institution, was warned to be extremely careful with regard to using handkerchiefs, towels, or anything which belonged to the children. She was well aware of the danger, and promised to be very careful. She handled nothing whatever, she said, that belonged to the children, left her cloaks outside, and in the classroom kept away from the children a distance of five or six feet. But upon examination of her eyes, 14 days after she had taken office, it was found that she began to suffer from granular lids. Upon inquiry I found

that she had been taking the copybooks and slates of the children for correction, and in all probability she got the poison from the slates and books on her hands and then conveyed it to her eyes. A teacher of another section in the same institution was more careful; she simply walked into the classroom, did not touch anything belonging to the children, and for two or three months, during the duration of this epidemic, she was not affected by the disease. The atmosphere had evidently not been the carrier of the contagion in the first case.—*Medical Reporter*.

Whooping Cough—What Is It?

Whooping cough is a highly contagious fever, affecting the entire system, but specially manifesting itself in an inflammation of the bronchial tubes and a spasmodic cough occurring in frequent paroxysms. The whoop is due to the rapid coughing. This renders it impossible to draw in the breath until the coughing ends, when the breath enters strongly through the glottis, still partially contracted by the spasm. It rarely ends in less than six weeks; generally its run is longer, sometimes many months. As a rule, the physician merely aims to palliate the symptoms, guard against complications and abridge somewhat the attack. Says Flint: "It must be admitted that there are no means by which the affection may be arrested."

A writer in the *Lancet* for March, 1886, thinks that the prevalent treatment has been directed too much to the symptoms, instead of to the cause. Hence the medicines prescribed have simply had an anti-spasmodic and sedative effect—relieving the cough, but not reaching the disease itself. During a severe epidemic of whooping cough, he noticed, on several occasions, a marked alleviation of the symptoms, and then at other times a marked aggravation. This led him to suspect some powerful atmospheric influence at work. On consulting his charts, he found that the former condition corresponded to a high percentage of ozone in the air, and the latter to a very low percentage. Ozone being a natural antiseptic (preventive of putrefaction), he at once commenced to treat his patients with antiseptic medicines, taken internally. The result was very favorable. The method was confirmed by further experience, proving satisfactory in almost every case.

THE GASTRONOMIC VALUE OF ODORS.—The magic and value of gastronomic odors lie in this, that they stimulate the flow of saliva and other alimentary juices, thus making sure that the food eaten will be thoroughly utilized in renovating the system. This stimulating effect of gastronomic odors also explains the French saying that the appetite comes while eating, as well as our habit of reserving sweetmeats, nuts, cheese, etc., for the end of a meal, when rich odors are needed to brace up the flagging appetite. So great and salubrious is the effect of gastronomic odors in stimulating all the glands and functions of the body, that a dinner of savory, fragrant courses may produce in the diner a feeling of warmth and exhilaration resembling the effects of wine, but with none of the depressing after-effects following excessive indulgence in that liquor. And thus it comes about that the epicure in search of "ignoble pleasure" finds it the source of health and of general contentment with the world.

CARBOLIC ACID IN INDIGESTION.—In a recent number of the *Practitioner and Nurse*, a correspondent says: "I have just passed through a severe attack of indigestion accompanied by colic, pyrosis, food eructations, epigastric weight, uneasiness, etc. Alkalies, muriatic acid, pepsin and pancreatic extract failed to give relief. Seeing your note in the *American Practitioner*, on the use of carbolio acid in acid eructations, etc., I took, with almost instant relief, two or three drops of the acid as soon after food as regurgitation, distention or acidity occurred. One dose was usually sufficient. On two occasions only was a second dose required. This I took half an hour after the first. I dropped the acid on a bit of fresh bread and rolled the mass into a pill. Since my own case I have given it in a similar case, with like good result. Here I added a scruple of carbolio acid to one ounce of glycerine. Dose, a teaspoonful."

NEW HELP IN SURGERY.—According to the statement made by Professor Bonafoux, a powder composed of equal parts of colophony, carbon, and gum arabic possesses a very great degree of hæmostatic power, and is capable, it is said, of so arresting the bleeding of large arteries as to prove decidedly serviceable in important surgical operations. The first experiments made by Professor Bonafoux with this composition were on the brachial artery in man, and on the smaller vessels, on the carotid of the horse, and other vessels of the same animal—all of these being attended with marked success.—*London Lancet*.

BLOOD POISONING FROM MACHINE OIL.—Take care, says *Power and Transmission*, how you let any machine oil or lubricator come in contact with a cut or scratch on your hand or arm, as serious blood poisoning may result. In the manufacture of some of these machine oils, fat from diseased and decomposed animals is used. All physicians know how poisonous such matter is. The only safeguard is not to let any spot where the skin is broken be touched by any machine oil or lubricator.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MISCELLANEOUS.—Amador Ledger, Feb. 5: J. F. Parks took charge of the Kennedy mine as superintendent on Tuesday. R. Boundy has been appointed foreman of the Keystone, the place vacated by Mr. Parks. The attachment of the Quartz Mountain mine has been released, and the mill resumed operations last Monday. Mr. Graham, one of the owners, is up from the city, looking into the affairs. All who claim to be posted have the utmost confidence in the paying nature of this property if fairly managed. As the immense mountain of quartz is big with promise of future prosperity to that part of the county, it is hoped that the bright prospects will not be marred by injudicious management. T. H. Goodman has sold his mine at Quartz Mountain, and a ten-stamp mill is being erected by the purchasers thereon. A dwelling-house is also being erected.

SUTTER CREEK.—Cor. Ledger, Feb. 5: C. E. Fournier, the contractor for the Wildman hoisting works, is getting along nicely with his job. He has got some of the framework up, and the shafts will be in position in a few days. The work next in order for the carpenters will be to put a building over the shaft. Mr. Fournier is doing most of the work himself, with one or two helpers. Knight & Co. are getting along with the pipe, and digging the ditch for laying the same will be commenced in a few days. G. W. Horn has about a half dozen men at work at the Maboney, getting rock out and filling all the dumps preparatory to starting the mill, which he expects to get in motion next week.

PLYMOUTH.—Amador Sentinel, Feb. 5: Quite a little boom has struck Plymouth in the way of mining excitement, and quite a number of claims have been located in the last few days. Mr. Geo. Claich, the owner of the Red Cloud mine, situated on the Pre-emption claim of E. S. Hall, has hauled and had crushed several tons of rock at the D. D. Reeves mill. He realized \$12 per ton in free gold, and the sulphurets were assayed by Messrs. Barney & Voorhies, of Sutter creek, and gave a return of \$180.32. The extension on the north of Claich was taken up by Peter Pretrunivich on the 29th of January, and duly recorded according to law, and active operations commenced. This claim is called the New Pacific, and the owner is getting first-rate prospects. Nick Ventich has located the New Eureka on the south extension of the Red Cloud. He says that he has had his eye on the place for the last 20 years, and never had a chance to get hold of it until now. All of the new locators agree in saying that this new ledge of quartz is on the same range as Amador City. All of the old stand-by working mines are pounding away, with good results as usual. In less than one year Plymouth will have eight or nine mills working, paying ore to the tune of \$2 or \$15 per ton, and no mistake. Dr. A. C. Smith is busy just now moving machinery to his mine near Nashville in El Dorado county. The doctor has some fine-looking ore on exhibition.

Calaveras.

ANGELS MINING CIRCLE.—Mountain Echo, Feb. 3: There has never been a time in the history of Angels that the quartz-mining interests looked more favorable and encouraging than at present. Mining men are frequently making their appearance among us, eager to purchase mining property. Thus far, all who have visited this locality have been favorably impressed with the mining interests. Prospectors are active, and numerous valuable discoveries have recently been made. The Stickle mine is making an excellent showing under its present management. Everything is running in full blast, with good results. On the 400-foot level, in the stopes running north, an immense body of good milling ore has been developed. Work on the other levels is progressing with considerable vim; the ore which is being extracted yields profitable returns for the expense of mining and milling. The mill is kept in constant motion, and everything in and about the mine and mill seems to work like a charm, so well are things arranged and managed. Mr. D. P. Pierce is the superintendent. The Utica mine is constantly in operation, and judging from exterior surroundings, prosperity evidently prevails. The ore which is now being mined is pronounced good milling ore. We are informed that an abundance of this grade of ore is in sight. The battery plates present a healthy appearance. Mr. Chas. Lane, the superintendent, is deserving of much credit for his energy in developing the mining interests of this section. The Marshall mill in this town is now engaged in crushing and concentrating the ore which is being hauled from the Jones mine, south of this place. Two hundred tons of the ore is being put through the batteries as an experiment. Several samples of the concentrations have been sent to San Francisco, none of which assayed less than \$1500 a ton; some going as high as \$2000 a ton. The Jones mine is destined to be one of the richest silver-producing mines on the Pacific Coast. Work will soon be commenced on this mine on an active and extensive scale.

THE LINDSAY MINE. owned in part by B. R. Prince, of Altaville, is situated within a mile of this town. It is being rapidly developed under present management, and is said by competent judges to be one of the richest mines in the country. It is the general impression of mining experts that it is located on the mother lode, which they say greatly enhances the value of a mine. About four years ago John Lindsay took charge of the property, and under his management the mine has increased fourfold in value. John thoroughly understands quartz mining and how to make it pay. He is one of the best timbermen in the county. A visit to the mine will convince the most skeptical of this fact. Recently several representatives of an English syndicate visited and inspected the mine with a view of buying it. The Tozer mine is in operation also. The Lowe crusher, better known as the "cannon-ball" mill, is running constantly, but with what success we could not ascertain. Other minor ledges are being worked throughout this section, the ore of which is principally crushed by the arastra process, many yielding satisfactorily.

WEST POINT.—Calaveras Chronicle, Feb. 5: Our

mines are moving quietly onward. The Lockwood has about 50 men employed. The Keltz mine is running a force of 20 men. The Star of the West mine and mill are both running. The Scorpion whistle keeps the West Pointers on time. The Water Lily mine is closed down at present.

Contra Costa.

THE DIABLO MINES.—Contra Costa Gazette, Feb. 5: Numerous mining claims have been located on Mount Diablo since the first public announcement, a month ago, of Mr. Stevens' discovery of a gold ledge on the side of Mitchell canyon, above Clayton. A number of men are engaged in prospecting, and it is to be hoped that the main ledge so far discovered will be opened up sufficiently to give it a thorough test. Twenty-three years ago a gentleman residing in Clayton sent specimens of ore from Mount Diablo to San Francisco to be assayed, and the rock held \$12 in silver and \$3 in gold to the ton. Last week the same gentleman sent some ore from the same ledge to the Selby smelting works in this county, which assayed \$10 in silver to the ton and showed a trace of gold. Good milling ore of this quality will pay handsomely to work, if found in sufficient quantity; if, however, the ore is refractory, it would cost all there is in it to work it. The mining district has not yet been permanently organized.

El Dorado.

LINCOLN.—Georgetown Gazette, Feb. 5: Work on the Lincoln mine is being carried on as rapidly as possible, and the general opinion seems to be that the Lincoln is a good mine. Superintendent Keefe is stopping at the mine and giving it all his attention. He has good men employed. Will and George Myers are working on the Wildwood mine on Rock Canyon. G. Sneder, the owner, thinks he will erect a mill when the mine is properly developed. We understand that work is progressing favorably on the St. John mine. The parties who are working the mine are evidently there to stay.

Fresno.

FINE GOLD NOTES.—Hilthre Miner, Feb. 5: The company from Santa Rosa who have bought one-half of the James & Francis mine have started to enlarge the working shaft. While leveling off the surface for the boilers, specimens of gold quartz were uncovered. The company is making extensive preparations to open the mine on a large scale. The McNally mine is looking well in the numerous drifts being opened up in ore. The ledge in the shaft improves in size, and holds its own in value as more depth is attained. The Last Chance mine shows up a strong two-foot ledge of ore in the east drift and a one and one-half foot ledge in the shaft of ore that mills from \$20 to \$25 per ton, and of good quality of milling quartz. Their ore dump contains about 60 tons of ore. The Hampton mine is located on the southwest side of Crooks' mountains, having a two-foot ledge in the upper shaft that is very rich. The ledge is alive with coarse gold. Mr. Hampton is drifting on the ledge in the tunnel 80 feet below the upper shaft. The tunnel is in over 400 feet. P. Dowling, Neil Nevens and Chas. Taylor have leased the Fleming mine with the agreement to sink 100 feet and drift 200 for one-half of the ore. The Hanover mill started crushing ore Thursday from the Hanover mine. Mr. H. S. Williams, the owner, arrived from Madera for the purpose of starting work on the mine. The White Bear mine has opened up a high-grade body of ore in size from wall to wall, including two clay selvages, of two and a half feet of quartz at a depth of 55 feet. The ore prospects to the pan (20 lbs.) \$80 per ton coarse gold; the sulphurets are very rich. The boys working upon the Fresno prospects uncovered rock in the ledge that is exceedingly rich. The ledge is one and one-half feet from wall to wall, incased in a sedimentary formation. The gangue is clay and talc that prospects from \$8 to \$10 to the pan. The boys who have leased the Fleming mine are down 65 feet upon a good two-foot ledge that arastras fully \$30 to the ton (in place), but will average at least \$20 all through. The Hilthre mine has been started up, with Mr. Wallace as superintendent and manager, who has a force of miners at work, making surface improvements. The depth of the working shaft is 312 feet. From being filled with water since Mr. Hilthre's death, the entire shaft will have to be re-timbered. The ledge is small (two-foot) but very rich in places; in three east drifts, and in the shaft, the ore will average \$65 milling value. The Santa Rosa Co., which has bought one-half interest in the James & Francis mine, has just received its boilers and hoisting works from the foundry in San Francisco. The Wilson mine is one of the best mining propositions to buy in this section. The owner is at a depth (incline) of 75 feet in the ledge, which is two feet in the sump of very high-grade ore; without the sulphurets, the entire ledge and talc selvage will mill \$80 per ton. The sulphurets assay \$350 per ton. The returns received by arastra was \$62 per ton. Messrs. Reed, Harris & Co. have recently opened up a very promising new mine on Pine Gold, which they have named the Lottie K. They have drifted some 60 feet on the ledge, and have found, along the entire distance, a well-defined ledge some 22 inches thick. The quartz is of a decomposed quality, and is fine milling ore. They have worked a considerable amount of the vein matter, and have been rewarded with an average yield of over \$80 per ton. The Red Mountain mine is judged as a good mining proposition. Its present depth is 60 feet upon a ledge of two feet of high-grade ore and three feet of ledge matter that prospects in coarse gold.

Inyo.

RICH STRIKE REPORTED.—Independent, Feb. 5: It is reported from Darwin that a large and rich ore body has been struck in the extension of the Defiance mine. George Lewis is the lucky prospector. The ore body is reported to be very large and the ore of good quality.

SAN CARLOS.—The San Carlos mine appears to be developing well. Very recently C. Hoole and his comrade made a shipment of ore from the mine, and now they have another lot ready for shipment.

Mariposa.

THE HITE'S COVE MINE.—Gazette, Feb. 5: The news from Hite's Cove is quite favorable. W. W. Hunter, who was employed to put in repair the air compressor, has finished the job, and the water in the shaft and mine is all pumped out. It only requires about two hours a day to keep the mine clear of water. Sam Tippet has taken a contract to drift 100 feet easterly on the lower level. A 60-foot

drift below the main tunnel level has just been completed. At present there are only 20 men employed. Judge Walker, who has charge of the mine, is below and is expected up, probably to-day. It is said he will be accompanied by the grand expert of the foreign company of capitalists, upon whose decision the fate of Hite's Cove for the near future depends. As represented to us, Judge Walker has simply put the mine in condition for inspection by the company's representative.

BUENA VISTA MINE.—We are informed that this mine has passed into new hands, with Mr. San Pedro, the celebrated expert at mining, at the head of the management. The sale was effectively concluded on Wednesday last, and Mr. San Pedro has gone below to purchase a new engine, boiler, pump, and rock-crusher. The main shaft is to be sunk 100 feet deeper, which, no doubt, will open out a fine body of ore. The Sherlock mining district, which comprises Whitlocks, Saxtons, Mono and Bear Creek, is fast coming to the front. During the last three or four months there have been a hundred or two strangers moved into that section. There is a small colony of a dozen persons or more from Oakland, including a couple of families lately moved in. The mining boom for that section has just commenced. From one to ten thousand dollar pockets have been found here within the last year.

Mono.

A RICH STRIKE.—Bodie Miner, Feb. 3: A. E. Bean, one of the co-owners of the Rattlesnake mine, who came in yesterday from the once famous Monocville, reports that very encouraging prospects have been encountered in the Rattlesnake mine within the last few days. There are two incline shafts sunk on the ledge. The north shaft has been sunk to the depth of 150 feet. From the bottom of this shaft a drift has been run north on the ledge. All the ore from this drift has been of a high grade, but at the distance of 35 feet from the shaft a deposit of exceedingly rich ore was struck. The vein in this drift is from 10 to 20 inches wide, and average assays from this point go as high as \$4000 to \$5000 per ton. Mr. Bean showed the Miner reporter several pieces that he had with him, which, to use a homely expression, were "perfectly lousy" with shining specks of gold; many of them apparently as big as peas. How extensive this deposit is, the owners cannot say, but it makes them feel mighty good for the time being. Ore from the southern portion of the mine, worked by arastra process, has paid from \$22 to \$45 per ton, and some assays from the central part have gone up into the hundreds of dollars per ton. From these workings it would seem that the northern portion of the mine is the richest part.

SWEETWATER MINES.—Esmeralda News, Feb. 5: A. Kilpatrick returned from Chicago last Wednesday, accompanied by W. W. Watson and J. W. Berlin, the latter two gentlemen representing Chicago parties, and are here for the purpose of examining the Monte Cristo group of gold mines, which are situated at Frying Pan, Patterson district, Mono county, California, and about four miles from Henry Williams' ranch, on Sweetwater, Esmeralda county, Nevada. This series of mines, five in number, were discovered nearly two years ago, since which time some work has been done tunneling and crosscutting the ledges. The present owners, Messrs. Kilpatrick, McCurdy, Cameron, Vansickle and Patterson, extracted considerable ore and milled 160 tons thereof which worked over \$18 per ton in gold. The ledges are of immense size and the ore free milling, averaging about \$12 per ton. In one mine a crosscut was run through the ledge, which proved it to be 35 feet wide. There is every facility for the cheap working of the ore, wood and water being abundant. If the report of Messrs. Watson and Berlin is favorable there is no doubt but that a sale of this property will be promptly consummated.

Nevada.

TEMPORARY SUSPENSION OF WORK.—Foothill Tidings, Feb. 7: The only serious drawback in this vicinity, arising from the storm, is the suspension of work at the Idaho, Empire, Badger and Crown Point mines. This is caused by the clogging by snow and consequent breakage of the South Yuba water ditch, away up in the mountains. This ditch supplies the mines mentioned with the water used as motive power. The ditch is supposed to have broken on Thursday night last, and as far as known, has not yet been repaired, but every effort to that end is being made. At the mines mentioned all work has ceased, save that the pumps are kept in operation, the steam connections having been started up at the Idaho and Empire. Water is being gathered from here and there to run the Badger pump, and it is expected that no difficulty will be experienced in so doing. The Crown Point pump is kept in operation by water from Wolf creek. Until the ditch is cleaned and repaired, no underground work can be done at the mines mentioned. The probability is, however, that the snow embargo will be quickly raised and work resumed in a day or so.

PLANET DRIFT GRAVEL MINE.—Grass Valley Union, Feb. 6: Wm. Keskeys, foreman of the Planet Drift gravel mine, on Lowell hill, this county, writes to M. Byrne, Jr., that the gravel is improving, and that the gold obtained from a recent cleanup was much coarser than any ever taken out before, ranging in pieces from one dollar up to eight. Some time ago the drifters struck a strong body of water, and they are now following upstream on this water, which will doubtless lead to the main channel, as indicated by the coarse gold just cleaned up.

MINES AROUND OMEGA.—Cor. Nevada Transcript: The gravel deposits on Diamond creek are being pretty thoroughly prospected this winter. Six companies are at work almost within a stone's throw of each other. E. E. Matteson & Co. are located on the north fork of the creek. They are running a tunnel into the hill to strike an old river channel that is known to exist there. Both below and above this point, large nuggets of gold have been frequently found. The old Lawrence claims have been leased to Chinamen, and are being worked by hydraulic process. They depend entirely on free water from Sawmill Flat, but they have had very little so far. Old man Merrill and his company are cleaning out and retimbering an old 180-foot tunnel on the Chase and Sanders ground preparatory to extending it into the hill further for prospecting purposes. The Hunken boys, John and Nick, are working on the opposite or south side of the creek. Their claims are pretty well opened, and it is supposed that they are receiving fair returns for the amount

of labor performed. Next above come the claims owned by John Dill. His ground is also well developed. Three men are at work drifting and breasting out. It is somewhat spotted on the hed-rock, but on an average it pays very fair wages for the times. The adjoining claim above Dill's is owned by a Salt Lake company, which has started a tunnel into the hill to prospect the ground above the Omega ditch, and early in the spring the work of pushing the tunnel ahead will be prosecuted with vigor. F. Fritzmyer is the company's superintendent. In quartz there is nothing doing, although there are some good-looking ledges around the head of the creek. The output of hulkion from this section may astonish the natives some day in the near future yet.

Placer.

GOLD RUN.—Cor. Placer Argus, Feb. 5: Within the last six months considerable activity has been manifested in the direction of quartz mining, and at the present time three mines are in good stages of development. The Big Blue, located four miles southeast of town, has a ledge 11 feet wide, and gives splendid prospects. Work is being pushed rapidly, and by spring will be in good working order. The proprietors are Jas. Stuart, Burt Moody, and C. E. Brown. The Live Oak, located a quarter of a mile from town, has been developed to a depth of 290 feet, has a ledge 10 feet wide, and, without doubt, will be a good mine. S. J. Jordan is the prime mover. J. Y. Thomas has been obtaining very satisfactory returns from the Never Sweat. This is a gravel claim and bids fair to be as good as the best of those on the Forest Hill divide. So that after all, while the residents of Gold Run will probably never again be disturbed by the musical roar of the "giants," the no less pleasing sound—to a miner's ears—of the rattle of the stamps may take its place.

Plumas.

CRESCENT MINE.—Greenville Bulletin, Feb. 2: For several months past work has been steadily progressing in and about the Crescent mine under the superintendency of Mr. A. W. Whitney. In years gone by, the Crescent mine produced a great deal of money, and was more beneficial to Indian valley than most any other mine operated in or near it, for in the working of the mine a great many men were employed, all of whom received fair wages regularly. A great deal of farm and dairy produce was consumed, for which cash was paid, thus assisting materially in giving the farmer and the dairyman a good market. The reopening of this mine, therefore, has been looked forward to with much interest. In the future, however, the mine will be worked with less expense, considering the work accomplished, than in former years. Steam-power has been dispensed with and water-powered instead. Furthermore, the company owns water privileges, which afford ample power to run the pump, hoisting works and the mill. This in itself will be a great saving. Immediately upon taking charge of the mine, Mr. Whitney, who is a quiet, careful and economical superintendent, prepared to sink the main shaft. This policy has been adhered to, and the work has progressed very favorably. Since the resumption of work, the shaft has been sunk 102 feet, making the total depth 180 feet. Most of the distance, 102 feet, was through "blue curly," and that of a very hard character. Sinking will continue. A very excellent feature about this mine is that the employees and other creditors are paid promptly at the end of each month.

A GOOD STRIKE.—About two weeks ago Henry Patten, an experienced quartz miner, started a tunnel in Ohio Point, just above the mouth of Rush creek, for the purpose of prospecting the extension of the Rich Gulch ledge. He did not run but a few feet before he struck a wonderful rich seam of quartz. The point was stripped years ago by the hydraulic process, leaving the ledge bare for several hundred feet. The ledge at this point is about 40 feet wide and the expense of getting out the rock is trifling. There is abundant water-power to run any number of stamps. Thos. Hughes, of Meadow valley, and Mr. Patten, are the lucky owners. A mining company is being formed to flume the river at Soda bar next summer. It ought to pay. Report says that a company of Chinamen at work on the East branch found a three-hundred-dollar chunk one day last week.

San Diego.

COAL-BEDS AT ELSINORE.—Los Angeles Times, Feb. 5: John D. Hoff, the fortunate discoverer of the extensive coal deposits at Elsinore, was in the city yesterday on his way home from San Francisco, where he has been to buy a plant for mining. While North he had his coal thoroughly tested by experts. It showed up better on analysis than the Seattle coal which is being shipped into San Francisco by the cargo. The Elsinore coal gives 10 per cent of ash, and the Seattle coal 18 per cent. The Elsinore article contains 41 per cent of inflammable gases, as against 33 per cent for the Seattle article. The Elsinore coal is a true lignite, of the same formation as the favorite Gallup coal, and Mr. Hoff, who has investigated the Gallup mines carefully, is satisfied that he has a better article. He is in partnership with John Dolbeer, a well-known San Francisco capitalist, and they control 400 acres of coal land, the present vein being 4 feet thick. The plant which Mr. Hoff has just purchased will enable them to mine 200 tons daily, and they promise to have their coal on the market within 60 days. The plant is to be shipped from San Francisco to-day or to-morrow. Mr. Dolbeer will reach Elsinore in person, by Saturday. The mine is 4 miles from the California Southern railroad, and 3 miles from the lovely and growing town of Elsinore. H. B. Wilkins, general freight and passenger agent of the California Southern railroad, will visit the mine, in a few days, to see about the practicability of running a spur to it. Mr. Hoff further states that a big sewer-pipe manufacturer, of Des Moines, will engage in the manufacture of cement sewer-pipe on an extensive scale near the mine, where there is a vast deposit of the best clay. The clay of Elsinore has become widely famous. The opening of extensive beds of good coal, in San Diego county, will be a big thing for all Southern California.

Shasta.

IRON MOUNTAIN.—Shasta County Democrat, Feb. 3: Jim Sallee continues to make bullion bricks at Iron Mountain. During the past week several small transactions of Squaw Creek mining property took place. The Cumberland Mining Co., of Bully Choop, is at work erecting its new ten-stamp

quartz mill, and will have it crushing ore by the middle of next month. Copper City people expect another boom in that camp soon. The Wintbrope Co. is at work, and it is understood that another company has bonded and about to purchase the Extra and Bully Hill mines, and commence developments on an extensive scale. An important mining enterprise has just been started in this county. In the vicinity of Jackass Flat, a region that in early days was rich in placer gold, is a streak of lava which is supposed to overlay a bed of blue gravel, supposed to be a hidden river channel. A company has been formed to sink through this flow of lava, expecting to strike the bed of blue gravel or supposed old river channel, which is expected to be rich in gold. In Nevada and Placer counties are a number of very rich drift mines in blue gravel, the leads all being capped with a flow of lava. The parties undertaking this enterprise say that the same surface indications exist here as in the rich blue gravel drift mines of Placer and Nevada counties. There shafts hundreds of feet deep were sunk through the same lava capping as found here, and several of the richest mines in the State were discovered years ago and have paid millions of dollars to the owners. The parties who have undertaken this enterprise at Jackass Flat are experienced in blue gravel drift mining, and firmly believe they will "strike it rich." If they are successful, a most important discovery will have been made.

LOWER SPRINGS MINES.—Some of the little incident happenings in the camp are interesting. Some tracing the Gem lead with a divining rod in the opposite direction from its natural source and continuation; others dragging a tape line and compass, taking up every nook of ground that can be found; while others claim more ground than their stakes and lines call for, and one man of a neighboring camp has located 22 claims for the present year. There are not 22 ledges on our side of the creek. The Eureka mine is the west extension of the Gem and is being worked by a tunnel running along on the vein so as to prospect it the entire distance of the tunnel, which is now in 54 feet, and very rich ore is encountered. The greatest depth on this vein is 18 feet; the pay chutes are going down below the level of the tunnel. Little Winnie mine is the west extension of the Eureka, located south of Middle Creek, facing Shasta, and within 12 feet of the east and west line of the Eureka, where splendid ore was taken out. The El Dorado is located west of the northwest corner of Mrs. Myres' patented land, and is a very promising looking mine. The Bulkhead and Eastern Star are fine prospects, and proper developments will make both valuable mining property.

Siskiyou.

PLACERS.—Yreka Union, Feb. 3: A very correct and clever article on our mines appears in the current issue of the MINING AND SCIENTIFIC PRESS. We take exception only to one point. Our placer mines are far from depleted. Only our shallow mines have been worked out and the move to work the deeper, and by far the most profitable, is yet in its infancy. With the advent of capital, the tide of which must necessarily be directed this way ere long, we will experience such an unearthing of wealth as the county has never known before. The era of quartz discoveries is scarcely upon us, but there can be no question but what there will be a complete revolution and vein mining will be the principal industry in time. Although Siskiyou ranks as the third greatest gold-producing county in the State, it cannot yet be said that it is even half prospected. To the capitalist and prospector alike Siskiyou opens a field for profit unequalled by any other county in the State.

Trinity.

QUARTZ DEVELOPMENTS.—*Journal*, Feb. 5: From Mr. J. W. Carter, of Hay Fork, who is in town this week, we learn that Shattuck's Huntington mill is doing good work, crushing about 15 tons per day. About 80 tons have been crushed from the Horseshoe mine, and the amalgam produced gives satisfactory results. The ore was considered to be of low grade and the result of the first crushing is certainly very flattering. This mine is now yielding a better grade of ore than at any time heretofore and the ledge is three feet wide. Rennie, Searies and Rourke have taken out about 60 tons of ore from their mine, situated at the head of Kingsbury gulch, which is estimated at from \$75 to \$100 per ton. Owing to the softness of the six miles of new road which they have built, transportation of ore to the mill has been retarded, but they will soon commence hauling steadily, arrangements having been made with Mr. Shattuck for crushing. Greenleaf and Marsh are running a tunnel on a two-foot ledge which they have recently discovered, and it prospects well. The Magdalene, on Kingsbury gulch, owned by Shattuck & Co., is showing up well, the tunnel being in over 80 feet. Messrs. Shattuck, Carter & Vogdes, owners of the Cyclone mine on Morgan gulch, have men at work taking out ore, about 60 tons having been deposited on the dump. The supply in this mine seems almost inexhaustible and the quality is highly encouraging. They will soon commence crushing, when the value of the mine can be approximately determined. Mr. Shattuck has stimulated the interest in quartz mining in that section to a high degree, for which he deserves great credit; and by the erection of a mill in that district he has enabled prospectors to give their ore a practical test.

NEW MILL.—From Mr. L. Castner, who was in town this week, we learn that the machinery for the Huntington mill to be built at the Venicia mine, Eastman district, recently sold by C. L. Blakemore to Mr. Probert, of San Francisco, arrived last Sunday. Twenty-eight thousand feet of lumber has been ordered from Mr. Jumper; the mill will be erected and put in operation as soon as possible, and another bullion-producer will advertise the quartz interests of Trinity county.

Tulare.

WHITE RIVER.—*Tulare Times*, Feb. 3: Mat Tyler, who has just arrived from the White River mines, near Tailholt, reports considerable ore being worked at the new mill there. The capacity of the mill is about 12 tons per day, and the grade of ore now being worked yields about \$25 per ton. The ore from the B. D. James mine yields \$125 per ton and upward.

QUARTZ.—Jack Shannon recently discovered a quartz mine in this vicinity. Robert Baker sent samples of the ore to San Francisco to have it as-

sayed. The following is the result per ton: Silver, \$154.83; gold, \$450. There is plenty of ore in sight.

NEVADA.

SAVAGE.—*Virginia Enterprise*, Feb. 5: 500 level—East crosscut No. 2 has been advanced 18 feet, the last 12 feet being in good ore. The station at the shaft on the 600 level has been completed, and are ready to extract ore from this level. 800 level—The south drift has been extended and timbered 25 feet. An additional distance of 80 feet will connect it with the old Savage or Curtis shaft. No. 3 west crosscut on this level has been advanced and timbered 25 feet. Most of the material in this drift is quartz carrying ore. 1640 level—East crosscut from north drift has been advanced 28 feet. The west crosscut, opposite, has been advanced 18 feet in low-grade ore. East crosscut from the south drift on this level has been advanced 25 feet, in quartz showing some ore.

OCCIDENTAL.—Upper tunnel—The south drift from the north incline winze has been extended 11 feet; total length, 103 feet. The east crosscut from the same level has been extended 7 feet; total length, 43 feet. From the north drift, same level, the west crosscut has been extended 9 feet; total length 25 feet. Lower tunnel—In No. 2 upraise, at a point 90 feet above the main tunnel, have advanced a north drift 16 feet.

GLADSTONE.—For the week ending Feb. 5, the tunnel has been driven ahead about 9 feet. The ground passed through has been the kind well known by Comstock miners along the line as heavy clay and vein stone ground, requiring the most substantial timbering. Have now driven 22 feet in this clay and vein stone.

IOWA.—Tunnels A and B have made the usual progress, with no material change to report during the past week. The drift south from A tunnel is all in vein matter, with a stringer of nice ore running with the drift, which is improving in size and quality going south.

POTOMAC.—South drift No. 1 on the 250 level has been advanced 30 feet. South drift No. 2 has been advanced 18 feet. Formations same as last week. Have about 500 tons of ore on dump. Will not hoist more until use of a mill can be obtained for crushing same.

BEST AND BELCHER.—600 level—West crosscut No. 2 has been extended 40 feet; total, 154 feet; porphyry formation. 800 level—West crosscut No. 4 has been extended 28 feet; total length, 188 feet. 1500 level—Northeast drift has been extended 48 feet; total, 348 feet.

GOULD AND CURRY.—425 level—East drift has been extended 33 feet; total length, 175 feet; formation in face, clay, porphyry and quartz. The upraise from the south drift on the same level has been extended 25 feet; total, 75 feet; formation, porphyry and stringers of quartz.

BALTIMORE.—Are cleaning out station and drift on the 250 level. The same character of work is being done on the 450 level. Have commenced excavating a station on the 550 level, preparatory to drifting there in promising ground.

CROWN POINT.—About 100 tons of ore are produced daily, principally from the lower levels, and shipped to the Mexican mill. Good progress is being made in the prospecting work inaugurated recently on the 300 and 400 levels.

IMPERIAL.—The work of repairing the shaft near the 600 level continues. By means of this opening excellent ventilation is afforded the miners working in the lower levels of the Yellow Jacket mine.

YELLOW JACKET.—The usual quantities of ore are shipped daily to the Brunswick mill. The yield comes principally from the 1200, 1300 and 1400 levels, and the net result is principally gold.

UTAH.—472 level—The north drift has been extended 43 feet; total length, 79 feet. This drift is in vein matter consisting of porphyry, clay and fine lines or streaks of quartz.

ALPHA AND EXCHEQUER.—North drift in Alpha is in 53 feet in quartz. South drift is in 50 feet, and the west drift 100 feet. Some of the quartz carries ore giving fair assays.

HALE AND NORCROSS.—The 1300 drift has been advanced and timbered 40 feet. Started two new crosscuts south 100 feet from No. 2 crosscut—one east and one west, each of which has been advanced and timbered 5 feet.

SILVER STAR.—The work of crosscutting in the north drift on the 100 level is progressing favorably. The formation encountered is of a kindly character and promises well.

BELCHER.—The Vivian and Santiago mills are kept busy crushing the ore produced from the 1200, 1300 and 1400 levels, the daily yield being 130 tons.

NORTH GOULD AND CURRY.—The work of cleaning out the shaft progresses favorably, and substantial timbers are being put in where necessary.

EAST BEST AND BELCHER.—Fair progress is being made in cleaning out the shaft. Expect shortly to commence important prospecting work.

SCORPION.—Good progress is being made in driving the drift east from the 300 station. Everything working satisfactorily.

SIERRA NEVADA.—520 level—Have advanced the south lateral drift 60 feet; total distance, 134 feet; vein formation.

CHOLLAR.—The main shaft is repaired to a depth of 500 feet.

Bernice District.

SALE OF MINES.—Reese River *Reveille*, Feb. 5: W. W. Williams has purchased the Hoyt and West-ernside mines at Bernice, Churchill county, of C. A. Richards for \$2400, and the property was deeded to the purchaser at Austin last week.

Eureka District.

ORE SHIPMENTS.—*Eureka Sentinel*, Feb. 1: During the past week ore shipments were made from the mines of the district to the two reduction works in town as follows: To the Richmond works—Silver Lick mine, 10 tons; Hoosac, 5 tons; Schenck, 6 tons; General Lee, 4 tons; Williamsburg, 8 tons; Dunderberg, 64 tons; McLeod, 3 tons; Fraser and Mobno, 25 tons.

Pine Grove District.

GOOD INDICATIONS.—*Esmeralda News*, Feb. 5: From a California mining man who has been ex-

pecting the Pine Grove mines the *News* reporter learns that that little heard-of camp is of more importance than is generally supposed. He says the country thereabouts shows indications of great possibilities in the mining line. The country has never been thoroughly prospected. Men have located small ledges, which yielded ore assaying from \$60 to \$100 on the surface, worked them until the ore began to deteriorate and then abandoned them. The Wheeler mine and the Wilson mine are the only two upon which much work is now being done. The owners of these mines are taking out considerable ore and making some money, but, our informant says, lack the enterprise to do development work which he thinks would lead to the discovery of veritable bonanzas. The ore of the district is all free-milling gold.

Santa Fe District.

ORE.—*Esmeralda News*, Feb. 5: Col. A. C. Ellis has a small force employed on his Sunrise mine at Santa Fe District. They are extracting good ore.

Tuscarora District.

TORNADO CON.—*Times-Review*, Feb. 6: During the week have extended west crosscut 10 feet. Have suspended work for the present in main drift. Are working two shifts in crosscut. No material change.

BELLE ISLE.—Line crosscut east, 150-foot level, continues in very hard rock. Total length, 60 feet. Work in west crosscut, same level, has been suspended, and the timbering and tracking are being removed.

NEVADA QUEEN.—The ground is heavy and has been timbered. Crosscut west from the gangway on the 300-foot level, to connect with the shaft, has been extended 15 feet. The rock continues hard.

NORTH BELLE ISLE.—Gangway north from the south end line on the 400-foot level has been extended a total distance of 200 feet. Distance yet to run to reach the shaft is 430 feet. Two hundred feet of the gangway on the 300-foot level has required timbering during the past month. A portion of this is swelling ground. Fair progress has been made with all other work in and about the mine.

NAVAJO.—North drift on new east vein, 150-foot level, was extended five feet and a total distance of 164 feet. The prospects are not being favorable; work at this point has been suspended and work resumed in the face of the crosscut. South drift on west vein, same level, has been advanced six feet. South drift on west vein No. 2 extended 11 feet; total length, 176 feet. Work has been resumed in the winze on the east vein, 350-foot level. There is no material change to report.

COLORADO.

IDAHO SPRINGS NOTES.—*News*, Feb. 5: The Mattie employs some 40 men and is shipping regularly a good grade of ore. William Ireland will have the machinery on the Star mine in running order in a few days. Work at the Plutus continues day and night. The company's mill at the mouth of Trail Run keeps pounding away constantly on ore from this mine, which employs about 40 men. The machinery has been placed in position on the Lexington mine, Squirrel gulch. Some work is being done in getting the shaft in shape, and by Monday sinking will be resumed. A number of miners secured jobs there this week. The Freeland mine has reduced its force. One hundred men were paid off Monday, and shipments will probably cease for four months. This is done to catch up with development. Work in the main shaft and levels progresses day and night. The Argo mine, Ute creek, now gives employment to over 60 men, including leasers and those doing company work. A new level has been started from the bottom of the shaft, and when in sufficient distance sinking will be resumed. Fifty tons of first-class ore was shipped to the sampling works during the month of January. The Bald Eagle, one of the Argo group, is shipping ore which nets \$118 per ton. A night shift will be added to this mine and the output increased. The Argo is destined to make an excellent property.

IDAHO.

FLINT.—*Idaho Avalanche*, Feb. 2: Mr. Dow Vincent, of Jordan creek, below Flint district a few miles, made us a call on Monday. From him we learned that the prospects of that camp never looked brighter. Rich ore is being extracted from several of the mines of the Flint Co., and much development work is being done. By spring Mr. Vincent thinks that the mines will be opened to such an extent that hundreds of tons of ore will be extracted daily. Flint will boom in the spring, and as soon as the plant is ready will produce regularly a good dividend.

ERA.—*Challis Messenger*, Feb. 5: Geo. Clark returned Saturday from Era, where he had been on a short trip. We learn that the mill is running right along, but that outside of that and the work done in the Horn Silver to supply the mill with ore, nothing of any consequence is being done in that section of the country.

MONTANA.

STILL SHUT DOWN.—*Butte Inter-Mountain*, Feb. 1: A gentleman who came up from Anaconda this morning says that the matting furnaces are still all shut down, owing to the fact that not sufficient coal has been received as yet to insure a continued supply. The concentrator is running as usual, however, and the regular daily shipments of ore from the mine are being received. The furnaces will start up as soon as the snow blockade is broken, so that there will be no further danger of a shortage of coal.

OREGON.

GOLD HILL.—*Cor. News*, Jan. 27: J. J. Parker and William Crossley, two old Black Hill miners, who have recently arrived at Gold Hill from Cœur d'Alene, speak very encouragingly of that locality, and say that Southern Oregon mines are the worst underrated mines in the United States, and that it is only a matter of a short time until Gold Hill is a great mining camp. All that is wanted is practical miners and capital to open the mines, and in a short time the prejudice that now exists against Southern Oregon mines as pocket ledges will be removed. There are 50 ledges within a radius of five miles of Gold Hill that will pay to work, and not a prospect hole 20 feet deep on any of them.

List of U. S. Patents for Pacific Coast Inventors.

From the official report of U. S. Patents in Drawings & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 1, 1887.

357,139.—CHEMIST'S BALANCE—Aitwood & Taylor, Oakland, Cal.
356,977.—WATER-WHEEL BUCKET—L. Biggio, Sutter Creek, Cal.
356,983.—MUSIC LEAF-TURNER—P. L. Carden, Dixon, Cal.
357,063.—PENCIL—W. C. Carlton, Baker Co., Ogn.
357,117.—TIME INDICATOR—J. H. Culver, S. F.
356,821.—GRATE—De Guerre & De Lano, S. F.
356,829.—REEL-SUPPORTING ARM—J. B. Gemmill, Red Bluff, Cal.
356,941.—PHOTOGRAPHIC CAMERA—Oliver Hydc, Vallejo, Cal.
357,151.—HARROW—D. Lubin, Sacto.
357,152.—CLOD CRUSHER AND PULVERIZER—D. Lubin, Sacto.
356,948.—DUMB-WAITER STOPS—J. J. Mahoney, S. F.
356,960.—TROUSERS STRETCHER—C. E. Ray, S. F.
356,961.—BREECH-LOADING FIREARM—J. W. Redfield, Glendale, Ogn.
356,955.—KITCHEN CABINET—B. C. Tabor, Salen, Ogn.
356,857.—WINDOW—Henry Tintrop, S. F.
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROLLER MILL.—George Cottrell, S. F. No. 356,623. Dated Jan. 25, 1887. The object of this invention is to provide simple and effective means for adjusting the rolls of the mill, which is done by peculiar construction of various parts.

SEWING MACHINE.—Chas. Kohler, Oakland, assignor to the Commercial Overseaming Sewing Machine and Manufacturing Co. No. 356,590. Dated Jan. 25, 1887. This invention is especially adapted to that class of machines which are designed for overseaming or sewing hags and similar goods, in which it is desirable to unite the edges by this particular form of stitch. The inventor patents a combination of devices.

CULTIVATOR.—Peter Frichette, Sheridan, Placer Co. No. 356,631. Dated Jan. 25, 1887. This is a cultivator or harrow of peculiar construction. The rotary movement of the standards of the front wheels enables the machine to make its turn, and provides for the use of four wheels instead of the usual three. When used as a simple harrow, the wheels and adjusting devices are omitted. Light plow teeth may be used when the work requires it.

HARVESTER.—Xavier H. Martineau, Fish Lake valley, Nev. No. 356,655. Dated Jan. 25, 1887. This is a mechanism for adjusting the draper-platform, and an improvement in the driving mechanism for the draper and sickle, adapted to adjust itself to the movement of the draper-platform. The object is to provide a simple means for adjusting the draper-platform for a high or low cut, as may be desired, and to provide suitable driving mechanism to adapt itself to the adjustment of the platform.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JAMES C. HOAG—California.
G. W. INGALLS—Arizona.
E. L. RICHARDS—San Diego Co.
R. G. HUSTON—Montana.
GEO. McDOWELL—Fresno and Tulare Cos.
M. S. PRIME—San Joaquin and Alameda Cos.
J. L. DOYLE—Amador and Calaveras Cos.
T. P. POWERS—Napa and Sonoma Cos.
W. J. FREEMAN—Sierra and Plumas Cos.
A. J. HARR—Sacramento Co.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know how to send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE FRISBEE-LUCOF MILL CO. has placed its business in the hands of Messrs. Hooker & Lawrence, mining engineers, at 145 Broadway, N. Y. On this coast the Pacific Iron Works may be addressed concerning the mills,

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manu-
 facture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under
 the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT
 instead of two. It is of greater capacity and more easily worked and
 kept in repair. The statement of Mr. Hendy that all styles are infringe-
 ments on the machines made by him, he knows to be utterly false. All
 litigation has been in reference to old style two jointed machines, which
 are superseded by our new style one jointed. The decision of Judge
 Sawyer, referred to by him, is carried up on appeal to U. S. Supreme
 Court, with absolute certainty of a reversal in our favor. Miners and in-
 tending purchasers are hereby notified that we are the sole owners of the
 patents covering this style of Giant; we will prosecute to the fullest ex-
 tent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

HENDERSON'S PATENT TRUSS.

Comfortable and Reliable.

This simple truss can be worn without inconvenience,
 and gives all the comfort to the wearer that can be ob-
 tained from a perfect-fitting, pliable apparatus. The pad
 is soft and yielding, and on account of its peculiar con-
 struction and the connections of its securing bands, can-
 not get out of place. It will remain in place no matter
 what position the wearer may assume. The engraving
 shows the construction of the appliance. It is simplicity
 itself, and is comfortable and reliable. Address,

JESSE G. HENDERSON,
 Grizzly Flat, El Dorado Co., Cal.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Academy of Sciences.

Dr. Harkness presided at the meeting of the Academy of Sciences on Monday evening last. Prof. Frank Soule and Dr. F. V. Hopkins were proposed for membership.

Dr. Bshar stated that since the last meeting Dr. Hammond had donated to the academy some fossil shells and the tooth of a horse found at a depth of 35 feet below the surface of Alameda creek. The doctor said he was not enough of a paleontologist to determine whether these specimens, either the shells or the tooth, belonged to extinct species, or to species now living. An enormous ivory tusk, 11 feet long and well preserved, of a mastodon, which was obtained from the natives of Alaska by Captain James McKenna and presented to the academy two years ago, has been placed in the museum, having been brought from the Merchants' Exchange, where it has been for two years past for the inspection of the ship captains and others.

Dr. C. M. Richter read a paper on "The Ocean Currents on the Western Coast of North America."

Announcements were made of the following appointments by the council: Publication Committee—H. W. Harkness, E. L. Greene, C. G. Yale, C. Troyer, George Hewston, Curators—Botany, M. K. Curran, E. L. Greene. Ethnology, S. Wooster, Mammals and birds, E. F. Lorquin, W. E. Bryant. Reptiles and radiates, Rosa Smith, H. E. Lorquin. Geology and paleontology, E. S. Clark, George Hewston. Mineralogy, Melville Attwood, C. D. Gibbes.

President Harkness exhibited some specimens of *Corticopis hugelii*, a remarkable fungus from Australia and New Zealand. He showed a species of caterpillar which never appeared above the surface of the ground, and from the head of which, after it died, springs a fungus growth having the appearance of a vine.

Dr. Bshar read a eulogy on the late Isaac Lea, the first honorary member elected in the academy and a member of a number of scientific and other societies both in America and Europe.

The secretary, Mr. Yale, stated that hereafter papers read before the academy would not be considered as intended for publication unless they were handed to the secretary immediately after they were read.

Mining Share Market.

Mining stocks have been rather active the past week. The Con. Virginia and California mine has declared another dividend of 50 cents, aggregating \$108,000. The first shipment of ore from the recent development on the 600-foot in the Savage mine has been made to the Mexican mill. The Overman has commenced to make daily shipments of 60 tons to the Vivian mill. The above mills have heretofore been crushing Crown Point and Belcher ore. The output from the latter mines will therefore be materially curtailed. The members of the Jones crowd, who control Crown Point and Belcher, are also heavy holders of Savage and Overman stock.

The several producing mines look well and give promise not only of continuing to yield for a long time at the present rate, but of a steady increase in productivity. Among the mines that were idle for quite a period until recently, and are now being prospecting, are several that, judging from the developments made and making in them, will soon be added to the list that are milling ore.

The following companies reported having had cash on hand Feb. 1, 1887: Sierra Nevada, \$23,417; Crown Point, \$24,210.74; Gould & Curry, \$4,872.42; Occidental, \$1,922.24; Chollar, \$43,871.07; Potosi, \$13,456.67; Exchequer, \$17,629.41; Mexican, \$2,082.89; Ophir, \$37,136.94; Crocker, \$5,961.46; Peerless, \$12,127.47; Peer, \$7,844.91; Con. California and Virginia—cash in bank \$346,336.42, and bullion unsold \$187,320.05; Utah, \$37,600; Orleans, \$1,703.40; Syndicate, \$9,591.90; Best and Belcher, \$15,493.92; Alpha Consolidated, \$6,460.02; Bulwer Consolidated, \$21,000; Bodie Consolidated, \$11,844.38; Mono, \$20,800.71; Tioga, \$31,180; Summit, \$495.26; Booker Consolidated, \$852.89; Lady Washington, \$18,640; Alta, \$20,341.51; Benton Consolidated, \$5,231.06; Belcher, \$3,688.52; Navajo, \$2,923.34; North Belle Isle, \$2,501.15; Belle Isle, \$1,880; Standard Consolidated, \$22,834.09; Independence, \$8,825.77; Andes, \$1,333.82.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

WILLIAM PENN M. Co. Feb. 9. Location, Plumas Co. Capital stock, \$300,000. Directors—John G. Phelps, Frances Gallego, George Sebaretz, John B. Fulton and Albert White.

CALIFORNIA GAS FIXTURE CO. Feb. 5. Object, manufacturing and selling gas fixtures, lamps and oils. Capital stock, \$100,000, in 1000 shares. Directors—Joseph Simonson, Frederick W. Farrar, Ralph P. Merillon, George F. Duffy and Eugene J. Duffy.

CALIFORNIA PAINT CO. Feb. 9. Object, mining, manufacturing, etc., mineral, metallic and other paints. Capital stock, \$200,000, in 2000 shares. Directors—J. S. Keeling, C. H. Miles, J. H. Woodward, A. J. McGovern, Wm. Alberger.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Silver Bow, Feb. 1, \$19,860; Bluebird, 1, \$22,376; Derbec, 3, \$70,000; North Bloomfield, 3, \$76,000; Eureka Con., 4, \$11,612; Richmond Con., 4, \$18,723; Locomotive, 5, \$36,620; Marget Ann, 1, \$4,000; Alice, 5, \$24,192; Marget Ann, 5, \$24,000; Bluebird, 5, \$22,704; Alice, 6, \$32,000; Lexington, 6, \$25,336; Silver Reef (for January), \$30,192; Germania, 4, \$37,655; Hanauer, 5, \$29,000; Germania, 5, \$39,471; Hanauer, 8, \$58,500; Bannock, 8, \$42,000; Germania, 8, \$37,550.

PHOTO-RELIEF ENGRAVING

BY THE BEST AND CHEAPEST METHODS.

OUR NEW PHOTOGRAPHOTYPES,

Made Direct from Photographs, for Newspaper, Book and Job Printing.

STAND NEXT TO STEEL PLATE ENGRAVING IN FINENESS AND PERFECTION. THEY ARE PRODUCED QUICKER AND CHEAPER THAN ANY OTHER GOOD ENGRAVING, THROUGH THE GREATEST INVENTION YET MADE IN PHOTO-ENGRAVING.

PHOTO-ELECTROTYPES, PHOTO-ZINCOTYPES, WAX PROCESS ELECTROTYPES, LITHOGRAPHERS' TRANSFERS, STEREOPTIC VIEWS, COUNTERFEIT MSS. ENLARGED, LEGAL DOCUMENTS REPRODUCED.

ALSO, PHOTOGRAPHING ON WOOD AND OTHER

SPECIAL PHOTO WORK,

Promptly and reliably done by the most successful and best approved processes.

Designs, drawings or photographs made to order. Engravings of buildings, Portraits, Maps and Scenery and Photo Samples for Salesmen are leading specialties.

Send, as early as possible, with full description for any work desired, stating size and for what use plates are wanted. Photographs and prints similar to those desired, will aid us in making definite estimates. Agents wanted.

Call and see specimens, or write for samples, prices and any further information wanted to

UNCLE Sam has found it at last! A sure remedy for Torpid Liver, Sick Headache, Habitual Constipation, Chills and Fever, and all affections of the Kidneys and Liver. This is a New Compound, and one trial will convince you that it is the Cheapest and Best Remedy in the Market for Diseases of Kidneys, Liver and Stomach. If you want a pure vegetable compound, that is positively guaranteed to contain no narcotics, go to your Druggist, and get a Bottle of the Arkansas Liver and Kidney Remedy. Price, \$1.00 per Bottle.

For Sale by all Druggists.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers.

227 First Street, San Francisco, Cal.

THE ORIGINAL Roller Ore Feeder

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller," he having had both of them operating side by side. We shall be pleased to show the latter, upon application, to any one interested. We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco.

ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 39 to 51 Fremont St., this city. As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Amador county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.

AMADOR COUNTY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ore to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries.

JAMES' PATENT RECIPROCATING STAMP MILL

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

PRICES:

Reciprocating Stamp Mill,	\$350 00
Rock Breaker, - - -	100 00
Automatic Ore Feeder, -	50 00
Single Track Ore Car, - -	40 00

Send for Circular.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

Water Pipe, Pump or Air Columns, Fish
Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines, Babcock and Wilcox Boilers,
Tustin Ore Pulverizers.

MARINE ENGINES AND BOILERS—
Propeller Engines, either High Pressure
or Compound, Stern or Side-wheel En-
gines.

MINING MACHINERY—Hoisting En-
gines and Works, Cages, Ore Buckets,
Ore Cars, Pumping Engines and Pumps,
Water Buckets, Pump Columns, Air Com-
pressors, Air Receivers, Air Pipes.

MILL MACHINERY—Batteries for
Dry or Wet Crushing, Amalgamating
Pans, Settlers, Furnaces, Retorts, Con-
centrators, Ore Feeders, Rock Breakers,
Furnaces for Reducing Ores, Water Jack-
ets, etc.

BABCOCK AND WILCOX BOILERS.

ICE AND REFRIGERATING MA-
CHINERY.

MISCELLANEOUS MACHINERY—
Flour Mill Machinery, Saw Mill Engines
and Boilers, Dredging Machinery, Pow-
der Mill Machinery, Water Wheels.

DEANE STEAM PUMP.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought
Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MA-
CHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE,

SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shapes
Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths.
STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled
Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat
Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames,
and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address:

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings,
cogs or pulleys.

Power applied direct. Works Ore at Low Cost.
More or less weight on Crushers as desired,

Very little friction. Beats other machines in reducing and
amalgamating ore, and costs less. All who have used this mill
recommend it highly. Splendid for low-grade ore on account of
low cost of working.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and con-
struction of Ditches, Flumes, Dams, Pipes, Flow of Water
on Heavy Grades, methods of mining shallow and deep
placers, history and development of mines, records of
gold washing, mechanical appliances, such as nozzles,
hurdy-gurdys, rockers, undercurrents, etc.; also describes
methods of blasting; tunnels and sluices; tailings and
dump; duty of miners' inch, etc. A very practical work
for gold miners and users of water. Price, \$5, post-paid.
For sale by DEWEY & Co., Publishers, 252 Market St., San
Francisco.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1890; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vannere, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insure their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

....BUILDERS OF....
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 600 feet of five-eighths steel rope. SEND FOR CIRCULAR.

SAN FRANCISCO, SATURDAY, FEBRUARY 19, 1887.

VOLUME LIV.
Number 8.

An Improved Automatic Cut-Off.

With this number we illustrate an engine fitted with a new automatic cut-off, the invention of R. A. McLellan, assistant engineer of the Geary-street Cable R. R. This cut-off was invented with the view of simplifying as much as possible the valve gear of an engine, with the additional merit of attaining as near theoretical requirements as the demands of the day call for. Aside from the cut-off, the engine has been carefully designed, and embodies, as nearly as possible, all the merits of the most improved modern engine. Although not indispensable, the "poppet" valve is used in this design, it being in the estimation of the inventor the best form of steam distributing valve ex-

with the use of centrifugal force as the governing principle. As point *H* of the cut off arm is moving in unison with the crosshead, it will be readily seen that the nearer the hook is to the point of suspension of the link *G* the shorter the cut-off, and vice versa. Both steam and exhaust valves are lifted by radial cams acting upon lifting levers, the ends of which are forked, one side fitting into the square portion of the valve-stem, and not shown in the engraving. Lap and lead are invariable under all degrees of expansion. By placing the valves on the top and bottom of the cylinder, instead of on the side, as is usual, the practice of the best builders has been followed, the clearance is reduced to a minimum, and means are fully provided for the instant removal of any water

Milling on the Comstock.

Although there are many people who suppose little is going on about the Comstock in the way of working ore, and who think the "camp" is a kind of dead one, this is by no means the case. Immense quantities of ore are being hoisted and worked. The mines are being developed and prospected in all directions. A great many old ones have lately been reopened, and those which have been worked continuously for years are being energetically developed. While only one of these mines paid any dividend this month—the Consolidated California and Virginia—those that are turning out ore are, of course, yielding more or less. If the district were a new one there would be a

The Mining Laws.

When the mining laws passed by Congress were approved May 10, 1872, it was thought that the new code regulating mineral lands covered every desired point. For a long time the regulations worked well, and very few amendments or changes were found necessary. The main feature of the laws was that which required an annual expenditure (in money for labor) on each claim, and it was thought this would break up the custom of men holding large quantities of ground. The compulsory expenditure was intended to make men work and develop their claims or give them up.

It is found now that while the object of the law is accomplished in some instances, it fails

McLELLAN'S IMPROVED AUTOMATIC CUT-OFF FOR STEAM ENGINES.

tant—its simplicity, low first-cost, and the ease with which it is kept steam-tight, all recommending it. As will be seen, the engine has few parts, all of which are easily accessible, and not liable to get out of repair. This also permits of comparatively high rotative speed, for which this cut-off is particularly adapted. Referring to the cut-off, two eccentrics are used, one of which is set coincident with the cross-head, the other set in advance of the crank 135°. This adjustment of the eccentrics, which form one of the principal features of the cut-off, gives an exceedingly quick steam admission, the action of which is not unlike that produced by the wrist-plate used on the Corliss engine. It will be observed that although the eccentric is set to close the steam valve at one-half stroke, yet by the prolongation of the vibrating link, *G*, beyond its point of connection with the eccentric rod *e*, the exhaust valves are also actuated by it, closing at about seven-eighths of the stroke. It will follow, therefore, that steam admission is not limited to one-half stroke, but depends upon the length of the slotted portion of the link, this being at the option of the builder. The point of cut-off is determined by the link block in the link *S*, this block being adjusted by the governor, which by the use of radial cams *v, v, v, v*, for lifting the valves, is very slightly disturbed, and will keep the engine as close to a uniform speed as it is possible

finding its way into the cylinder by the foaming of dirty boilers or rapid condensation. Taken altogether, the engine appears to us to present many valuable features, suggesting a close study of the engines built by the celebrated firm of Sulzer Bros., Winterthur. This patent is for sale, further particulars of which can be had by applying to the inventor.

THE low grade of ore recently produced from the Crown Point is the cause of the management of that mine relinquishing the Vivian mill to the Overman, in which mill Senator Jones is reported to hold a controlling interest. The curtailing of the milling facilities heretofore employed in crushing Crown Point ore has resulted in a corresponding decrease in the ore output from that mine and a material reduction in the force of miners.

U. S. SENATOR WILLIAMS has introduced a bill, intended to authorize the redemption of \$20 gold certificates at San Francisco. Merchants on the Pacific Coast cannot get enough \$20 gold pieces now, and it is desired that the law shall be amended to give greater convenience to the business men of the coast.

THE Wheatland Graphic says there are rumors of fine quartz ledges in the foothills near that place, and hopes for a mining boom.

great deal of talk about the ore product and the wonderful mines; but the yield of these mines in the past has dimmed their present decreased production.

There is a total of 499 stamps in quartz mills contiguous to the Comstock, including the Thompson mill, fitted with a Huntington crusher, which is rated at 30-stamp power. The following list of available mills, and the number of stamps of each, we take from the Virginia Chronicle:

Water-power—Mexican, 40 stamps; Morgan, 40; Brunswick, 56; Santiago, 28; Vivian, 16; Eureka, 60; Rock Point, 20; Douglass (Dayton), 5; Briggs, 12; Pollard, 8; Bowie, 5; Empire State, 5; Fisher's, 2; Hully's (lower mill), 5; Courser, 5; Bossell, 5; Pfeiffer's, 2.

Steam-power—Thompson (Huntington crusher), 30-stamp power; Rhode Island, 30; Petaluma, 24; California, 80; Douglass, 12; Winfield, 5; Baltimore, 10.

Of the above there are now a total of 320 stamps dropping night and day—all, with the exception of the Pollard and Douglass mill, on ore from mines along the Comstock lode. The pulverizing capacity of a quartz mill is usually rated at three tons to each stamp, but the ore extracted from the Con. California and Virginia mine is very brittle, and mills running on it crush an average of over four tons to each stamp in a day of 24 hours.

in many others. The intent and spirit of the law is evaded. Hundreds of locations and relocations are made every year, upon which little or no work is done, merely for speculation. In nearly every camp the results of this are seen, and there is now a very decided opinion that some change should be made which will compel men to work their claims or give them up. It is not necessary for us to go over the ground of the defects in the law. The matter is well understood by the mining community. The change desired is one that will remedy the present defects. People should not be allowed to take up a lot of ground, let it lie idle a couple of years, let the location lapse, relocate, and repeat the process. A stop should be put to it. There is little doubt that another session of Congress will be allowed to pass without the present laws relating to mining being amended.

THE petition of the Sutro tunnel stockholders for leave to intervene a defense against the foreclosure of their property in the suit pending in the United States Circuit Court of Nevada, has been submitted to Judge Sahin. The court granted a stay of proceedings until March 2d, to enable counsel to submit further arguments.

THE quartz interest in and about Angels never looked more promising than at present. Prospectors are active and numerous.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EES.

The Cœur d'Alenes.

An Account of Several Idaho Camps.

EDITORS PRESS:—The Cœur d'Alenes at this season can boast of a large amount of "the beautiful." It has been snowing all winter, but only recently got down to business. The snow at present is three feet deep, and still snowing. Further up the valley they have six feet. The mining outlook for this section seems to be very brilliant. The Sullivan and Bunker Hill mines here are working their regular forces, and the concentrator turns out 30 to 35 tons of lead concentrates daily, averaging 70 per cent lead and 60 ounces silver. The total number of men employed is 80. The Bunker Hill does not look as well as it did two or three months ago, but the Sullivan, across the gulch, looks far better. These properties are now hooked to a pool of the Standard Oil Co.'s directors for \$600,000, and will undoubtedly be sold, when smelting works will be erected having a capacity of 100 tons daily. The Starn-Winder, Tyler and Richmond claims, on the same vein, are showing up fine ore bodies. The Sierra Nevada has 1000 tons sacked and ready to ship. The value of this ore is not high, but will pay handsomely. The Crown Point, over which one Fenian was killed and another wounded in October, is now being worked by the party in possession, and shows 12 to 14 feet of solid galena ore, high in silver. The Antimony mine at Pine Prairie and smelter was sold this week at sheriff's sale. The new narrow-gauge railroad from here to Cœur d'Alene Mission is a masterpiece of engineering. It takes two locomotives to pull three loaded cars carrying 10 tons each. The road is 13½ miles long; freight on ore \$5 to \$6 per ton, and passenger fare 14 cents per mile. The trains manage to make a round trip a day, leaving in the morning at 6 o'clock and returning some time in the night. The curves are so short that it is impossible for a car to pass over them at a speed of over two miles per hour without being derailed, while the grades stall a locomotive with two empty cars.

The mines up the river are looking exceptionally well. The California mine, owned by Scott McDonald, up Nine Mile, shows a large vein, with 12 feet of galena ore, averaging 60 ounces silver per ton. The Granite, at the head of Nine Mile, is showing immense ore bodies. The latter property is hooked to Portland people, and there is sufficient ore on the dump to pay for the mine.

At Lake Creek, 12 miles east, Lee George's big lead mine is developing a body of ore second to none. On Canyon creek the Tiger mine is being put in shape for sale, and while the ore is somewhat zincy and refractory, the quantity compensates for it, and it is probable it will ship 150 tons daily the coming season. The Extension, bonded by Noah Armstrong, shows an immense vein of high-grade galena, free from zinc. Nigger Prairie or Mullen still looms up. Mr. Hackett, the agent of Dennie Ryan, of St. Paul, proposes to put up a large concentrating plant on the Hunter, recently purchased, as soon as the weather permits. This mine has 65 feet of concentrating ore, 6 feet of solid galena and 1 foot of rich chloride ore. It is developed by a tunnel in the vein 400 feet and a depth of 300 feet. The Morning, the Evening, and a dozen other large veins assure the future of Nigger Prairie, or Mullen City, as it is called.

On the Murray side the lead property at Myrtle, lately sold for \$17,000, is being worked extensively by Messrs. Durant & Co. The Golden King now crushes 40 tons per day with their 10 stamps, and are saving a handsome margin above working expenses. The claims on Bald Mountain near Doctorville, named after the indefatigable dentist, Doc Smith, who stuck to them and showed what they were, are to be worked by eastern capitalists in the spring. The Mother Lode Co. is running its arastra above Murray and making money. The extensions east have two arastras and are earning handsome dividends. The Golden Chest has a bonanza of free-milling gold quartz, and when the new mill is completed in May, it will roll out a stream of wealth.

The Idaho mine, managed by Mr. Scowden, formerly of Nevada, has a 20-stamp mill built—lots of ore out, but there is some financial hitch and the mill has not started. The directors from Louisville are there investigating matters, and it is rumored Mr. Pettit, formerly superintendent of the Monarch mine, at Atlanta, this Territory, and now superintendent of the Golden Chest, is to succeed Mr. Scowden and the mill put in operation. The snow is now four feet deep at Murray and extensive placer mining operations are being prepared for.

Murray has a population of 2000 and a bright future. Wardner has 80 saloons, 3 dance-halls, 12 stores, 2 hotels and a dozen lodging-houses. The population is the standard mining camp crowd consisting of 10 per cent respectable people and 90 per cent saloonmen, gamblers, town lot jumpers and similar characters. While mining matters are quiet, the whisky element makes things lively.

MINER.

Wardner, Idaho, Feb. 5, 1887.

Pipe and Sewer Discharge.

In last February P. J. Flynn, C. E., read a paper on a modification of Kutter's formula given in Molesworth's "Engineers' Pocket-book" in this form:

$$C = \frac{181 + \frac{.00281}{s}}{1 + .026 \left(41.6 + \frac{.00281}{s} \right)}$$

And he proved that this value of C differed very little from a constant coefficient having the value of 85, so that

$$V = c\sqrt{rs} = 85\sqrt{rs}$$

Following the notation adopted by Mr. Flynn let

V = velocity in feet per second.

Q = discharge in cubic feet per second.

C = coefficient of mean velocity.

S = fall of water surfaces (h), in any distance (l), divided by that distance = $\frac{h}{l}$ = sine of slope.

a = area of cross-section of pipe or conduit.

p = wetted perimeter of pipe or conduit.

r = hydraulic mean depth in feet = area of cross-section of pipe or conduit in square feet divided by its wetted perimeter in lines

$$\text{feet } r = \frac{a}{p}$$

d = diameter of pipe or conduit.

n = the natural coefficient, the value of which depends on the nature and condition of the bed of the channel through which the water flows, or in other words, its degrees of roughness. In this case n = .013

In Van Nostrand's Engineering Magazine for September last a letter appears under the signature of Mr. Guildford Molesworth, C. E., the author of the "Pocket-book," and dated May 17th, from Simla, India, in which he says: Mr. Flynn's criticism of my modification of Kutter's formula for pipes has just reached me. Mr. Flynn is quite correct. The formula as it stands on page 25 (should be page 254) of the 21st edition of my "Pocket-book" has an omission of \sqrt{d} . As I had originally framed it, it stood thus:

$$C = \frac{181 + \frac{.00281}{s}}{1 + \frac{.026}{\sqrt{d}} \left(41.6 + \frac{.00281}{s} \right)} \quad (1)$$

And then he gives a table (given below) showing that the results, by his modification of the formula, differ very little from the results by Kutter's original formula. It is apparent that Mr. Molesworth has modified Kutter's formula in order to facilitate computations. Kutter's formula has this form:

$$C = \frac{41.6 + \frac{1.811}{n} + \frac{.00281}{s}}{1 + \frac{.013}{\sqrt{r}} \left(41.6 + \frac{.00281}{s} \right)} \quad (2)$$

In this formula $\frac{.013}{\sqrt{r}}$ is equal to $\frac{.026}{\sqrt{d}}$ as given in Molesworth's formula (1) and as n = .013, the terms $41.6 + \frac{1.811}{.013}$ is equal to 180.908. Mr. Molesworth has made this value 181, and, except this small change, the formula is identical the same as Kutter's, and requires almost as much work in computation.

Mr. Flynn, however, has given a modification of Kutter which simplifies and lessens the work of computation in a very material way. In this modification, the slope is taken as 1 in 1000, which gives a value of S = .001. For the slopes usually adopted in practice for pipes, sewers, conduits, etc., that is, for slopes not flatter than two feet per mile, or one in 2640, this formula will give velocities that, for all practical purposes, may be considered as almost identical with the velocities obtained by Kutter's formula (2). When the value of n = .013, as in this case, Mr. Flynn's modification of the formula is:

$$C = \frac{183.72}{1 + 44.41 \times \frac{.013}{\sqrt{r}}} \quad (3)$$

This, again, is further simplified by Mr. Flynn. The value of n having been fixed, in this case, .013, for the particular pipes or channel under consideration, a small table, including all the diameters likely to be used, is made out in the following shape:

Diameter.	Value of $\frac{.013}{\sqrt{r}}$
0 feet 6 inches.....	.03672
4 " " ".....	.01300
6 " " ".....	.00919
8 " " ".....	.00722
10 " " ".....	.00622
20 " " ".....	.00351

As an instance, we want to find the velocity in feet, per second, in a sewer, eight feet diameter, and slope one in 2600; then

$$V = c\sqrt{rs}$$

And in the above value of c formula (3) insert for $\frac{.013}{\sqrt{r}}$ its value, as given in the table opposite four feet diameter is. We have then:

$$C = \frac{183.72}{1 + 44.41 \times .00919} = 130.5$$

$$\text{And } V = 130.5\sqrt{rs} = 130.5\sqrt{2 \times .000384615} = 3.62 \text{ feet per second.}$$

This practical engineer engaged in carrying out the details of a large sewerage project or other work, requiring numerous computations, will appreciate the saving in time and labor to be gained by the use of Mr. Flynn's formula. Herewith is given the table which is included in Mr. Molesworth's letter, together with an additional column showing the value of c by Mr. Flynn's formula:

	Kutter.	Molesworth.	Flynn.
6 inch diameter, slope 1 in 40.....	71.5	71.43	69.5
6 inch diameter, slope 1 in 1000.....	69.5	69.79	69.5
4 feet diameter, slope 1 in 400.....	117.0	117.00	116.5
4 feet diameter, slope 1 in 1000.....	116.5	116.55	116.5
8 feet diameter, slope 1 in 700.....	130.5	130.63	130.5
8 feet diameter, slope 1 in 2600.....	129.8	129.93	130.5

This table shows the close agreement of the results by Flynn's simplified formula with Kutter's complicated and tedious formula. With the single exception of the six-inch pipe on a slope of 1 in 40, which is more applicable to a house-drain than a sewer, the results do not differ as much as half of one per cent, so that for all practical purposes Flynn's modification of the formula may be considered to give identical results with Kutter's formula. This is well illustrated in a volume of Van Nostrand's Science Series on the "Flow of Water," by Mr. Flynn, and lately published. In this work he gives a table of the discharge of sewers, which shows the great utility and saving of time by his formula.

In a late report on the sewerage of Washington, D. C., by Captain F. V. Greene, U. S. Engineers, a table is given of the discharge of circular sewers, computed by Kutter's formula (2). This table now given shows the discharge of the circular sewers, as taken from Capt. Greene's report, and also the discharge as computed by Flynn's formula:

DISCHARGE IN CUBIC FEET, PER SECOND.	Kutter.	Flynn.
10-feet diameter, slope 1 in 100.....	1673.66	1670.00
10-feet diameter, slope 1 in 200.....	1183.28	1181.49
10-feet diameter, slope 1 in 300.....	965.70	964.60
20-feet diameter, slope 1 in 100.....	10240.64	10255.90
20-feet diameter, slope 1 in 200.....	7240.13	7251.95
20-feet diameter, slope 1 in 300.....	5903.55	5921.24

The difference in discharge is so very small that the results as given by the rapid method of Flynn's simplified formula (3) may, for all practical purposes, be taken as identical with those given by the use of the troublesome and tedious Kutter's formula (2).

An inspection of the formulas (2) and (3) will show the great saving in computation that can be effected by the use of Flynn's formula (3). Exactly the same results as by formula (3) can be found by the much readier method of the tables published by Mr. Flynn in Nos. 67 and 84 of Van Nostrand's Science Series. The tables give a great saving of time, even when compared with formula (3), and even as a check on the formula they can be used with great advantage.

Flynn's simplified formula is applicable to any value of n. Thus, if we call the numerator on the right-hand side of formula (3) K, for any value of n, we have:

$$C = \frac{K}{1 + 44.41 \times \frac{n}{\sqrt{r}}}$$

And

$$V = \left\{ \frac{K}{1 + \left(44.41 \times \frac{n}{\sqrt{r}} \right)} \right\} \sqrt{rs}$$

In the following table the value of K is given for several of the most generally used values of n for pipes and other closed channels:

n	K	n	K	n	K
.009	245.63	.012	195.33	.017	150.94
.010	225.51	.013	183.72	.020	134.06
.011	209.05	.015	165.14	.0225	124.90

If, therefore, in the application of Flynn's formula (3) within the limits of n, as given in this table, we substitute for n its value and also the value of K, we have a simplified form of Kutter's formula. For instance, when n = .011

$$V = \left\{ \frac{209.05}{1 + \left(44.41 \times \frac{.011}{\sqrt{r}} \right)} \right\} \sqrt{rs}$$

IRON MOUNTAIN.—Of ore out, in sight, and that cut through by shaft and tunnels, it is estimated there is enough in view and assured to exist by the works already accomplished, to employ a mill and reduction works of medium capacity 20 years to reduce to bullion. The shafts and tunnels, so far as sunk or run, all penetrate through continuous bodies of paying ore and terminate in the same solid material. Therefore the full extent and astonishing immensity of this mastodon mine can only be conjectured, and left to the future for unfoldment. But with what is already thoroughly prospected, and estimated on the scale which the inferior grade ore yields by the present working process and machinery, the mine will at least yield \$400,000 worth of bullion per annum, which in 20 years of reduction would aggregate \$8,000,000. But it has already been demonstrated by a number of tests made by the working of several thousand tons of carefully selected ore from this mine at Swansea, England, and Denver, Colorado, that a yield of bullion can be confidently

expected from the best grade of ore, which, put through by the present mode of working and capacity of machinery employed, will give a result more than quadruple in value of the low-grade ore recently worked. Truly the boss mine of the State is located at our very doors, and we can soon number millionaires among our residents.—Shasta Courier.

For Coast Defense.

The text of the bills making appropriations for ordnance and sea coast defenses, as passed by the Senate, is as follows:

SECTION 1. That the Secretary of War be and is authorized to make contracts with responsible steel manufacturers, after suitable advertisements, to continue not less than 30 days in the newspapers most likely to reach the manufacturers addressed, for a supply of rough-bored, rough-turned and tempered steel, in forms suitable for heavy ordnance adapted to modern warfare, and steel finished for armor and other army purposes, in quantity not to exceed 20,000 gross tons, in quality and dimensions conforming to the specifications, subject to inspection and tests at each stage of manufacture, and including all parts of each caliber specified; provided that no money shall be expended except for steel accepted and delivered; that each such contract to erect in the United States a suitable plant, including the best modern appliances capable of making all the steel required, and of finishing it in accordance with the contract and agreement in the ordnance contract; to deliver yearly a specified quantity of each caliber, the time of delivery of the small caliber to commence at the expiration of not more than 18 months, and that of the largest caliber at the expiration of not more than three years from the date of acceptance of contract, and that all forgings shall be manufactured in the United States.

SEC. 2. That the Secretary of War be and is hereby authorized to erect at Watervliet arsenal, West Troy, N. Y., an army gun factory, in accordance with the report of the Gun Foundry Board of December 20, 1884, and for finishing and assembling guns adapted to modern warfare to the approved sizes, and for the manufacture of gun-carriage and ordnance equipment for the army at a cost not to exceed \$7,000,000.

SEC. 3. That for the purposes of the foregoing sections the sum of \$3,000,000 is hereby appropriated, out of any money in the treasury, not otherwise appropriated, to be available during the six years from January, 1887.

SEC. 4. That for the purpose of the construction of fortifications and other work, as coast defense, such as masonry and earthwork foundations for turrets, casemates and magazines, submarine mines and galleries, exclusive of armor, in accordance with the recommendations of the Board of Fortifications or other defenses, as appointed by the President of the United States, under the provision of the Act of Congress approved March 3, 1885, \$5,000,000 to be expended, per direction of the Secretary of War, is hereby appropriated.

The Senate has passed the bill to encourage the manufacture of steel for modern naval ordnance, armor, shafting and other naval purposes, and to provide heavy ordnance adapted to modern naval warfare. This bill is like the other in important particulars, except that the gun factory is to be at the Washington Navy Yard, and that the fourth section of the other is omitted.

Platinum.

Where Found, its Price and Uses.

Mr. P. H. Dunnagan, of Jamestown, and others, want to know the price, etc., of platinum.

The importers' price for refined platinum has risen steadily since 1883, when it was \$6.50 to \$7.50 per ounce, according to quantity bought. It is now worth \$7.50 to \$8.50.

The most important sources of platinum are the hydraulic mines at Nizhne-Taglsk, and Forgo-Blagodat, in the Ural mountains. About 80 per cent of the world's production comes from this source. Next in importance are the gold washings of the Pinto, in the United States of Colombia. About 15 per cent of the entire product comes from this source. It is also found in Brazil, Borneo, Hayti, Peru, India, Australia, and in the sands of the Chadiers river, in Quebec. It has recently been found in a quartz vein in New Zealand. The interest in the deposit lies in the fact of the extreme variety of platinum in place.

Platinum has been found in small quantities in various parts of this country, associated with free gold in placer deposits, but it is only from the placers of California that it has been produced in merchantable quantity, which amounts to between 100 and 200 ounces per annum, and is sold at 75 cents per troy ounce. It contains about 85 per cent of the metal, and is shipped to London to be refined.

The platinum used in this country comes almost entirely from Russia, and the imports amount to between 2000 and 3000 pounds annually.

Platinum "ore," as it is called, contains iridium, rhodium, gold, copper, and iron. It is sometimes, though seldom, found crystallized in cubes and octahedrons, but more usually in rounded or flattened grains, or "sand" having a metallic luster. It is very rarely found in place, but mixed with placer gold sands.

The principal consumption of platinum is in the manufacture of chemical apparatus, but, within the past few years, the use of incandescent electric lights, and also gas-jets, made luminous by a heated platinum spiral, have caused an increased demand for the metal, and the steady rise in price, during the past three years, may be referred to this cause.—Georgetown Courier.

The Anti-Dynamite Bill.

The following is the full text of what is known as the "anti-dynamite" bill introduced in the California Legislature by Senator Henry Vrooman, of Alameda county:

An Act to protect life and property against the careless and malicious use or handling of dynamite and other high explosives.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. It shall be the duty of each and every person, contractor, firm, association, joint-stock company and corporation manufacturing, storing, selling, transferring, disposing of, or in any manner dealing in or with, or using or giving out, nitro-glycerine, dynamite, vigonite, Hercules powder, giant powder or other high explosive, by whatever name known, to keep at all times an accurate journal or book of record, in which must be entered from time to time, as they are made, each and every sale, delivery, transfer, gift or other disposition made by such person, firm, association, joint-stock company or corporation in the course of business or otherwise of any quantity of such explosive substance.

SEC. 2. Such journal or record-book must show in a legible handwriting, to be entered therein at the time, a complete history of each transaction, stating the name and quantity of the explosive sold, delivered, given away, transferred or otherwise disposed of; the name, place of residence or place of business of the purchaser or transferee; the name of the individual to whom delivered, with his or her address, with a description of such individual sufficient to provide for identification.

SEC. 3. Such journal or record-book must be kept by the person, firm, association, joint-stock company or corporation so selling, delivering or otherwise disposing of such explosive substance or substances, in his or their principal office or place of business, at all times subject to the inspection and examination of the peace officers or other police authorities of the State, county, city and county, or municipality where the same is situated, on proper demand made therefor. Any failure or neglect to keep such book, or to make the proper entries therein at the time of the transaction, as herein provided, or to exhibit the same to the peace officers or other police authorities on demand, shall be deemed a misdemeanor, and punished accordingly.

SEC. 4. In addition to such punishment and as a cumulative penalty, such person, firm, association, joint-stock company or corporation so offending shall forfeit for each offense the sum of \$250, to be recovered in any court of competent jurisdiction by action at law. The party so instituting such action shall not be entitled to dismiss the same without consent of the court before which the suit has been instituted. Nor shall any judgment recovered be settled, satisfied or discharged save by order of such court after full payment into court, and all moneys so collected shall be paid to the party bringing the suit.

SEC. 5. Any person who, in the public streets of any highway of any county, city and county, city or town, or at, in or near to any theater, hall, public or private school or college, church, hotel or other public building, or at, in or near to any private habitation, or in, on board of or near any railway passenger train, or car, or tram, or cable road, or car of the same, or steam or other vessel engaged in carrying passengers, or ferry-boat or other public place where human beings ordinarily pass or repass, shall recklessly or maliciously have in his or her possession any dynamite, nitro-glycerine, vigonite, Hercules powder, giant powder, or other high explosive, or who shall recklessly or maliciously by use of such means intimidate, terrify or endanger any human being, is guilty of a felony, and on conviction shall be punished by imprisonment in the State Prison for a period not less than one year.

SEC. 6. Any person not regularly engaged in the manufacture, sale, transportation, or legitimate use in blasting operations or in the arts, of such substances as are named in this Act, shall be presumed (prima facie) to be guilty of a reckless and malicious possession thereof within the meaning of the foregoing section, if any such substance is found upon him or in his possession in any of the places or under any of the circumstances specified in the preceding section.

SEC. 7. No person may knowingly keep or have in his or her possession any dynamite, vigonite, nitro-glycerine, giant powder, Hercules powder or other high explosive except in the regular course of business carried on by such person, either as a manufacturer thereof or merchant dealing in the same or for use in legitimate blasting operations, or in the arts, or while engaged in transporting the same for others, or as the agent or employee of others engaged in the course of such business or operations. Any other possession of any of such explosive substances as are named in this Act is unlawful, and the person so unlawfully possessing it shall be punished by imprisonment in the State Prison not exceeding five years or by fine not exceeding \$4000, or by both such fine and imprisonment.

SEC. 8. Any person who maliciously deposits or explodes, or who attempts to explode, at, in, under or near any building, vessel or boat, railroad, tramroad or cable road, or any train or car, or any depot, stable, carhouse, theater, schoolhouse, church, dwelling-house, or other place where human beings usually inhabit, as-

semble, frequent, or pass and repass, any dynamite, nitro-glycerine, vigonite, giant or Hercules powder, or other high explosive, with the intent to injure or destroy such building, vessel, boat or other structure, or with the intent to injure, intimidate or terrify any human being, or by means of which any human being is injured or endangered, is guilty of a felony, and on conviction thereof shall be punished by imprisonment in the State Prison not less than one year.

SEC. 9. Any person, firm or corporation who shall take, carry or transport, or cause to be taken, carried or transported, any dynamite, vigonite, nitro-glycerine, Hercules or giant powder, or other high explosive, into the limits of or through or across any incorporated city or town of this State, or into, through or across any harbor for shipping, in any manner, condition or quantity, or otherwise, in violation of the laws or ordinances of such city or town, or of the laws or regulations governing such harbor, shall, in addition to the penalties provided or imposed by such laws, ordinances or regulations, forfeit to the State of California all such explosive substances, as well as the cases inclosing the same. Such forfeiture may be sued for by any citizen of the State, for himself and the State, and the goods or property, when so forfeited and recovered by judgment of the court, shall be sold and the proceeds divided, the citizen so suing taking one-half to himself for his own benefit and paying the other half into the State Treasury. Such action may be maintained in any court of competent jurisdiction, provided that the State shall never be liable to any cost or expense for any such suit or proceeding.

SEC. 10. Any of the forfeitures provided for in this Act may be taken advantage of and sued for and recovered by any peace officer or policeman of any city, city and county, or town, where the same arises for his own benefit, notwithstanding any law, ordinance or rule to the contrary.

SEC. 11. This Act shall take effect and be in force from and after its passage.

THE LONGEST TUNNEL IN THE WORLD.—An engineering work that has taken over a century to construct can hardly fail to offer some points of interest in its history, and illustrate the march of events during the years of its progress. An instance of this kind is to be found in a tunnel not long since completed, but which was commenced over 100 years ago. This tunnel, or at least as it should be more strictly termed, is at Schemnitz, in Hungary. Its construction was agreed upon in 1782, the object being to carry off the water from the Schemnitz mines to the lowest part of the Gran valley. The work is now complete, and it forms the longest tunnel in the world, being 10.27 miles long, or about one mile longer than the St. Gothard, and 2½ miles longer than Mont Cenis. The height is 9 feet 10 inches, and the breadth 5 feet 3 inches. This tunnel, which has taken so long in making, has cost very nearly a million sterling, but the money appears to have been well spent; at least the present generation has no reason to grumble, for the saving from being able to do away with water-raising appliances amounts to £15,000 a year. There is no further point, however, worth notice, for if we have the advantage of our great-grandfathers in the matter of mechanical appliances, they certainly were better off in the price of labor. The original contract for the tunnel, made in 1782, was that it should be completed in 30 years, and should cost £7 per yard run. For 11 years the work was done at this price, but the French revolution enhanced the cost of labor and materials to such an extent that for 30 years little progress was made. For 10 years following, much progress was made, and then the work dropped for 20 years more until the water threatened to drown the mines out altogether. Finally the tunnel was completed in 1878, the remaining part costing £22 a yard, or more than three times as much as the original contract rate.—*Engineering*.

AN ENORMOUS ARTESIAN WELL.—An artesian well, now being bored at St. Augustine, upsets many preconceived opinions about Florida. The well, which is 12 inches in diameter, is the largest artesian well in the world, and by actual measurement flows at the rate of 7,000,000 gallons per 24 hours. The well is now 760 feet below the surface, and is being deepened every day. A three-inch cable of the strongest material is used to hold the immense drill which is being used to sink the well. The old-fashioned idea that Florida was of a coral formation has of late years been vigorously disputed. The boring of this well proves that an immense depth of coral underlies the State, and samples of the material have been saved at every stage of depth, and for the last 550 feet the drill has been going through coral rock. Another interesting fact is developed, that the lower the well is drilled the higher the temperature of the water becomes. It is now about 80° F.—*Jacksonville (Fla.) Dispatch*.

THE SAN FRANCISCO & NORTH PACIFIC RAILROAD Company have just completed a new bridge across the Russian river at Healdsburg to replace the old wooden Howe truss-bridge which did duty there for a long time. The new bridge is a Pratt combination, with two spans of 193 feet each, and is built on concrete piers. Its strength was tested the other day by running three of the heaviest locomotives of the company across it. It was constructed from the design of Chief Engineer Frank K. Zook.

The Sastro Tunnel.

New York Capitalists Working for its Control.

A rumor that the Sastro tunnel property is about to be transferred to Eastern capitalists has been circulated among a few officers on Pine street. An attempt to trace the report to an authoritative source confirmed the news to a certain extent. It was learned by the *Chronicle* that in April, 1886, the holders of mortgages aggregating \$997,832.52, upon which interest amounting to \$650,000 had accrued, began suit in the United States Circuit Court at Carson, Nev., for foreclosure. Harvey Darnell, of this city, was appointed examiner, and, after several hearings, the testimony was transmitted to Carson. The present trustees were disposed to permit the mortgages to be foreclosed, but opposition to this mode of proceeding aroused the ire of the Eastern stockholders represented by Palmer and Lowengard, of New York, who were dissatisfied and wish to be represented by individual counsel. A motion was to have been heard in Carson recently, on proceedings for an intervention of adverse stockholders. The New York people pray for three months' time in which to prepare a defense to the action of the mortgagees. They make a showing of 165,000 shares of stock, although, as Secretary Ames thinks, they have large blocks of stock masked, which will be brought out when required. The mortgagees own the largest individual block of stock, and are claimed by the adverse stockholders to be playing into their own hands. McCalmont & Co., of this city, are the leading figures in the mortgage suit, and they controlled the elections for the last few years, whereby William Jones, David Cahn, Hugh Marshall, Charles W. Brush, Pelham W. Ames, Thomas P. Stoney and R. H. Pond were elected trustees. Mr. Pond died recently. Charles W. Brush is president of the Sastro Tunnel Company and Pelham W. Ames is secretary. The London, Paris and American bank (late Lezard Freres), of which Trustee Cahn is manager, is treasurer.

Until recently the 2000 shares of stock, which have a nominal par value of \$10, were widely dispersed among a very large number of holders. The value of the stock has fallen from \$6, at which figure it sold readily in 1880, to 18 cents, at which figure it was quoted in New York several days ago. The mortgage put on by the trustees represents money borrowed at 1 per cent a month from McCalmont & Co. The New York stockholders believe that the earnings of the company are sufficient to pay a reasonable interest on the investment, and have been quietly at work gathering in stock, and are believed now to be in a position to revolutionize the Board of Trustees at the annual meeting to be held next month. They are expected to elect their own officers and assume control of the company. Who will be made president, and what policy will be pursued, it is impossible to ascertain outside of New York. The company collects a royalty of \$2 a ton on all ore over \$40 a ton, and \$1 a ton on all ore under that figure taken from the Comstock lode, and averages \$24,000 a month income, with expenditures at \$5500, leaving a net income of \$18,500. It was rumored that John Mackay and J. C. Flood were in league with the Eastern capitalists and contemplated buying the tunnel, and this was regarded as indicative of a new bonanza; but Mr. Flood emphatically denied this. He assured the reporter that he had no pecuniary interests in the mines and would not consider any proposition looking to further investments in that direction.

FROM MINE TO MILL.—Mr. Jewett, the efficient superintendent of the Black Bear mine, on Squaw creek, has invented a cheap and effective method of transporting the ore from the mine to the mill, thus dispensing with the heavy-grade wagon road. The ore is run out of the tunnel and dumped into one or two cars that run on a tramway, which consists of a double-track road built on the side of the hill, with a grade of 30 degrees. From one car at the bottom of the tramway a rope passes up to and around a drum, and is then fastened to the other car at the top of the road; this one is filled with ore and started down grade, the loaded car hauling the empty car up ready for loading. The ore is then emptied into a bin at the end of the track and hauled on an easy grade to the mill, thus overcoming the one great obstacle to the successful prosecution of the work.—*Shasta Free Press*.

THE SALT LAKE DEMOCRAT inquires: Out of \$30,000 profit made by the United States in the coinage of silver since 1878, is it too much to ask that a few thousands more or less be expended in providing vault room for silver dollars, for which certificates of small denominations cannot be issued in sufficient numbers to meet the people's demand? The hue and cry raised by the gold bugs against this necessary expense, illustrates the folly of a penny wise and pound foolish policy.

MONTANA MINING STOCKS.—On the St. Louis stock board, mining stocks are called twice a week and always attract a crowd of investors. The principal demand is for Montana stocks, and Granite Mountain and Bi-Metallic are selling high up. Montana mines are so favorably regarded that it is hoped no citizen of this territory will ever consent to lend his name to

any scheme to float a questionable stock. Yet we learn that several such schemes are on foot on the east side of the range, where some absolutely worthless properties have been capitalized and are now being placed on the market. A good time to stop that sort of business is right now.—*Inter-Mountain*.

Machinery at the University.

In the College of Mechanic Arts, University of California, is the following outfit of machinery: The only machine in the State for testing the crushing strain of various materials is a prominent object. By the aid of this apparatus, the tensile and transverse strength of bricks, building stones, cements and wire can be ascertained by any person, free of cost. Its capacity is equal to 25 tons. A smaller machine stands in proximity to the larger apparatus, but its use is only applied in testing the strength of such articles as may be used in the laboratory. A seven-horse power engine stands in the laboratory, its power being utilized in making experiments. A series of cones, built up perpendicularly, furnish the means for adjusting helting in such positions that the results of different rates of speed can be determined. A tubular boiler in the rear furnishes steam for both the seven-horse power engine and a 15-horse power Ohmen engine. As the hours of work are limited during several days in the week, it would be very expensive were fires lighted to get up steam to drive the machinery upon such occasions. Economy has been studied and a gas engine of four-horse power runs the machinery on these off-days. A modification of the jet-pump has been applied by Mr. Sladky to an apparatus which makes water the motive power to obtain a strong blast upon a gas-jet or furnace. This blast is very useful in experiments, and would be highly appreciated by assayers and metallurgists. A furnace for melting brass and copper, with a steam hammer having a 50-pound drop, completes the equipment of the blacksmith's shop. The wood working machinery is located in a spacious room and comprises one hand, one circular saw, lathes and planers. In the metal-working department a lathe, a planer and a hand-drill may be seen, while the entire stock of tools necessary for cutting screws and gearing are ranged in cabinets on the walls. A very fine machine made by Mr. Sladky for cutting spur gearing for screws of various gradations is placed in a small room adjoining the machine shop.

BAND-SAWS are not made, in this country, to carry more than one blade, but we believe machines are made in England carrying two. A manufacturer recently said, referring to these saws, that he did not think they would answer for the lumber resaw in this country. In England, lumber is sent to the market in the form of deals, which are 2, 2½, and 3 inches in thickness, and 9 to 14 inches wide. These deals have to be resawn into thin material, and it usually requires several cuts to do this. Here, the greater part of the lumber is sent to the market 1 inch thick. A gang-saw is used very largely in England and on the Continent, while in this country it is seldom used, except in the large mills where they use gangs for sawing up lumber.—*Mechanical News*.

THE ANTELOPE MARBLE.—The marble recently discovered on the east side of Antelope Valley, about five miles east of T. B. Rickey's place, is thought to be very valuable. Last week, W. E. Lindsey, of the Reno Marble Works, who is one of the owners, went out to Antelope for the purpose of making arrangements for shipping a large quantity of the marble to Reno. The marble is of several colors, says the *Genoa Courier*, and works splendidly, taking an exceedingly fine polish. It has a very fine grain and is pronounced equal to the best Italian. Mr. Lindsey has procured an engine in Mason Valley, which he will place at the quarry, for the purpose of sawing the marble.—*Elko Free Press*.

MINING DISCOVERY.—S. J. Anderson and Chas. Nofsinger have discovered a lead in Winnemucca mountain, which they have named the "Standard Dollar." The lead is small, well-defined and rich, as far as prospected, the ore averaging \$100 per ton from the grass-roots down. The owners intend to ship a lot of it to the Reno reduction works in a few days. The lead is located in the south end of the mountain.—*Silver State*.

That there is a prosperous boom in store for Siskiyou county is evidenced by the large number of applications being made for timber and agricultural lands. Mining locations continue to be made at the rate of a dozen a week and immigration from adjoining counties has already begun.

It is estimated that \$150,000,000 of gold can yet be extracted from the Nevada county hydraulic mines. California will need that gold some day, and then the festive hydraulic picker will be in his glory once more.

IMPROVED GRAPE CRUSHING MACHINE.—W. H. Worth, of Petaluma, has perfected a machine to stem and crush grapes, which, it is claimed, will revolutionize that work at the wineries.

Passing Events.

The whole State has received an abundant supply of rain and snow from one end to the other. There has been some damage done by the storm, both in the North and South, and several shipwrecks; but, generally speaking, the whole coast has been largely benefited.

The abundant fall of snow in the mountains insures for the miners a good water supply this season. Although it can no longer be utilized for hydraulic mining, a great deal is now used for power at quartz mills, as well as for ordinary mining purposes, drift mining, etc.

A great many immigrants are now coming to this State to settle permanently, and thousands of excursionists or tourists are coming also. Most of them are going to the southern portions, but there is now more attention being paid to central and northern sections than heretofore. The whole State is having a very good "boom," and values are increasing everywhere.

The railroads are showing an increase of traffic in every direction on this coast, and are being extended in many places.

The San Francisco & North Pacific railroad has just completed their fine bridge over the Russian river, at Healdsburg. The bridge was constructed by the California Bridge Company, of Oakland. The structure is light, airy and beautiful, composed of wood and iron. The massive piers are of concrete. The bridge consists of two spans of 200 feet each. It was tested by a heavy train of engines, the deflection being very slight.

What Would Have Come of a Goldless California.

The Sutter-Marshall discovery of gold in California has had so much to do with this shaping of her subsequent career that one is prone to speculate as to what would have been the probable fortunes of this country had that event never occurred. Many there are who believe or affect to believe that California, by reason of her climatic attractions and her other natural advantages, would have become rapidly populated, and even made astonishing progress in other respects had no gold ever been found here. In support of this view we are reminded that a considerable emigration from the Western States had, as early as 1846, set in toward the Pacific Coast, and that California, having a little later come into the possession of our Government, that emigration would, in any event, have been swollen into large proportions. The people who arrived in the country at that day consisted mostly of families who, bringing with them their worldly all, came here to make permanent homes. They left the Western States because of the severity of the winters, the frequent failure of the crops, and the prevalence there of the fever and ague, a malady from which most of them had suffered terribly. Finding in California such entire exemption from these evils, it may well be supposed that these people entertained no purpose of ever going back to their old homes to reside. As evidence of this we are told that the immigrants who reached the country while it was still under Mexican rule, proceeded at once to obtain grants of land and settle upon them; they who arrived after the American occupation showing the same disposition to take up land and improve it for homesteads.

Very different was it with the immigration that arrived here after the discovery of gold. Few came to stay. During the 20 years following that event not 10 per cent of all who came to California remained permanently. As a consequence, while the arrivals were many, the fixed population of the State grew slowly. Substantial improvements were retarded, nearly everything being done in a hasty and slipshod manner. Extravagance, improvidence and waste prevailed. Even in public matters was this the case, few having the true interests of the State much at heart. Out of this condition of things grew lawlessness, crime and a generally low standard of morality. More than 40 years have passed since our people took possession of California, and yet the State contains to-day less than a million inhabitants. A growth of population this, over which we have little cause for the display of much enthusiasm. During these years the country, through the flow and ebb tide of immigration, has, of course, been filled and emptied of its inhabitants many times over. Still, the fact remains that California is, as regards population, outranked by many States of less importance.

So reason they who have little faith in gold as a promoter of good morals or solid progression. Now, while it is possible that affairs might have taken the fortunate turn above predicted, even though no gold had ever been found in California, the probabilities are that they would have resulted very differently. It may be admitted that these emigrants from the malarious West, once in California, would have remained here. Also, that the movement so begun would have been kept up for a long time, and perhaps even to this day. Then, too, the slight immigration from Mexico, Central and South America, the Hawaiian and other Pacific islands, already in progress, would, no doubt, have been continued, and perhaps augmented. That the ubiquitous Chinaman would, in good time, have put in an appearance, may well be supposed. The number of runaway sailors, constituting always in the seaport towns a considerable percentage of the foreign population, would have grown apace, while the Mormons, who had sought on this coast an asylum before the era of gold, would have arrived in larger numbers than they did had that event never occurred, inasmuch as it tended to defeat the object they had in coming here.

Beyond peradventure there would, by this time, have been gathered in California a large population, had the gold find at Sutter's Mill never happened. But, while so respectable in numbers, what sort of a people, let us ask, would have come of this strange agglomeration of races, the inferior so largely predominating?

What sort of a civilization would have been developed through this mixing up of the pure Castilian and the Indian-Spaniard with the Western Frontiersman, the Kanaka, the Mongolian and the Mormon? Little in the way of social, educational or industrial advancement could have been expected from a society so made up, there being present in this hybrid community too little of the American element to give shape and direction to public affairs or deeply impress American ideas on the institutions of the country. The native Californian with his few wants and his narrow ambitions being first on the ground and numerically in the ascendant, the habits and business methods of all would have largely conformed to his standard, the same "poco, poco" style of procedure obtaining under the new regimens as under the old order of things. Everything would have been performed in a slothful and dilatory way, nothing being done to-day that could be put off till to-morrow, and nothing being done at any time that could possibly be avoided. The country, instead of being filled up with a thrifty, enterprising, wideawake people, would have been sparsely inhabited by a listless, procrastinating, ease-loving race, who to any appeal for haste, if perchance such a thing could have happened, would have answered according to the established custom of the country, *manana, senor, manana*, everything going on as in the olden time with its *dolce far niente*—sweet laziness!

With a goldless California, San Francisco would have remained largely a city of adobes, with a single morning, and possibly an evening paper, not so much as one hebdomadal being issued elsewhere in the State; if, indeed, California would as yet have been advanced to the dignity of Statehood. Whether a railroad would have spanned the continent is problematical. Inland travel would, for the most part, have still been performed on mule and mustang back, few local railroads being built. Water transportation would have been carried on moeily with sail vessels, the ancient hide-droger plying about the bays and running up and down the rivers. Instead of producing almost everything and shipping annually to the extent of many millions, the chief products of the country would have been long-horned cattle and wild horses; its chief exports hoofs, hides and tallow. Although the farmer might not have continued to reap with a machete and plow with a stick, there would not probably have been seen at this day even so much as a single gang-plow or a machine reaper in all the land. In the absence of gold, the industries of California would have been few and of limited extent; the record of her productive achievements, brief and scanty. As the mud-built structure of primitive times contrasts with the palatial edifice of the present day, so would the civilization of the past have contrasted with that since planted here. Conflicts between peoples, united by the mosaic process without being socially commingled, would have been frequent and inevitable, keeping them in a state of constant turmoil and excitement, if it did not lead to internecine war.

In a community compounded of such different nationalities, each speaking its native tongue, a new and common language, adapted for carrying on ordinary intercourse, would have been evolved. This would have been unavoidable. What this common language would have been like, it is easy to divine; consulting precedent, there is reason to believe it would have much resembled the trade lingo established many years ago between the Hudson Bay Fur Company and the aborigines of the Northwest, this barbarous dialect, known as the "Chinook Jargon," having been made up from the English, the Indian and the Canadian French, all of which had, in the process of adaptation, been more or less corrupted.

The extent to which this dialect once prevailed in Oregon is denoted by the following experience had by a missionary sent to toil in that field of labor: Visiting a Sunday-school, the evangelist propounded a variety of questions pertaining to biblical personages and events, and received, as he tells us, the answers here given. "Who was Pontius Pilate?" "He was a hyass Tyhee in Jerusalem." "What did the Jews do to the Son of Man when He appeared among them?" "They memaloost him!" "From what did the Savior make the wine drunk at the marriage-feast of Cana?" "Made it from tum-tum chuck!" "With what did He feed the multitude when

they were abungered and had nothing to eat?" "Fed 'em on sapolill muck-a-muck." "What did Christ say to Satan when the latter sought to tempt Him on the mount?" "Said, wske clossh, klatawa skooknm," and so on through the entire category of questions and answers provided for the use of the Sunday-school teacher and his scholars.

The above shows how far this lingual abomination had at one time spread among the "Webfeet," the evil having been arrested in both Oregon and British Columbia by the discovery of gold in these countries. To a similar event was due also the check put upon this barbarism in California, and but for which it would, no doubt, have gone on growing and spreading, till both the English and Spanish tongues would have become debauched beyond recognition or recovery. In saving them from this shame our people owe to the great gold find a debt that has not always met with proper appreciation.

The State Mining Bureau.

We have received the two parts of the Sixth Annual Report of the State Mineralogist. They are issued at the same time, but separately. Part I is by H. G. Hanks, ex-State Mineralogist, and Part II is by Wm. Ireland, Jr., the present officer. This latter part is sent to the Governor by authority of the Trustees of the State Mining Bureau. The first part was apparently sent by the ex-State Mineralogist, and the Trustees do not appear to have had anything to do with it, as they have no report in the volume. Why there is more than one report we are not informed.

Mr. Hanks' report contains two maps, one of San Diego Co., and the other of Julian district, in the same county. They are large, colored lithographs. There is a chapter on "Building Stones and Building Materials in California." There is also a table of altitudes, most of it taken from the Bulletin of the U. S. Geological Survey. Then comes a chapter on "Mineral Springs in California," and one on the "Calistoga Silver Mines," with lithographs of views around Mt. St. Helena, Napa Co. Outside of this, the only mines spoken of in the book are those of San Diego Co., to which a chapter is given. The last 50 pages are devoted to an alphabetical descriptive list of California minerals, with localities. The whole report comprises 145 pages.

Mr. Ireland's report, which forms Part 2, comprises 222 pages. It contains the report of the Trustees of the Mining Bureau, with a summary of the needs of the institution. The most important chapter is the "Report of the State Mineralogist," which is an account of the leading mines in several counties, written by Mr. Ireland himself. This chapter contains more about mines and mills than any ever before published in any of these reports. It is not entirely satisfactory, because it should have been much more complete. However, Mr. Ireland explains this by the fact that it was impossible, with his duties in the Bureau itself, to give the time to this personal observation that was desired. There are several interesting diagrams and engravings in this chapter. The figures given of details of mining and milling are valuable.

Following this comes a brief chapter on bullion production, etc. Then the report contains a chapter on "Mine Drainage," illustrated; tables of weight of quartz mills, gold and silver; "Concentration of Gold and Silver Ores on the Pacific Coast," illustrated; and "Chlorination."

The remainder of the report is devoted to "Mineral Products of the United States," from the U. S. Geological Survey Report; the "U. S. Mining Laws," tables concerning water, and a great many pages from the code, giving the legal distances in the State. These latter portions may be possibly considered superfluous, but the previous parts of the book are so much more practical, from a miner's point of view, than these reports usually have been, that the "padding" may be forgiven.

The Trustees and Mr. Ireland may be congratulated on one thing, at least. They have made a beginning in collecting just such information as the mining community is after. There is nothing scientific in the report; there is very little about minerals. We have had possibly too much "science" and too much "minerals." The miners now want something about mines and about the machinery used in mining.

and milling. This, Mr. Irsan has tried to give them as far as possible. We believe had this plan been followed a few years ago, the Bureau would have been popular enough to have obtained a decent appropriation from the Legislature. The spectacle of mining men getting up in our legislative halls and working against an appropriation because they did "not believe the State Mining Bureau was any good to the mining industry," was very depressing to the friends of the institution. And unfortunately this influence was so great that the appropriation was cut down from a proper figure to a mere pittance. As it looks at present, the Trustees and State Mineralogist will be unable to carry out their plans of improvement, but will have to go on in the same old rut for awhile longer.

It is true the collection of minerals is growing, and the museum portion is all right. But it is the practical mining that must be looked after. We want a sort of "blue book" that people may have, which will tell them about where our mines are, what they are, how they are worked, and what things are used in working them. It is of the utmost importance that the collection of this sort of material be made. The actual existence of the institution, in fact, depends on it.

The present State Mineralogist, who has not been in office many months, shows by his report that he recognizes that the mining, milling and mechanical features require attention. It is unfortunate that this was not realized long ago. It is something which was often urged by the Bureau's friends. There should have been a Board of Trustees from the time of the organization. The plans laid out by the present Board, in summing up the "needs of the Bureau," in their report, were very good ones, and looked directly toward carrying out experiments of different kinds, making investigations, etc. But without more money than it is now proposed to give to the Bureau, none of this important work can be done. The proposed investigation would be of far more value than a mere collection or determination of minerals, and of much greater practical use to the miners of the State. It is very unfortunate that a sufficient appropriation has not been made to conduct the Bureau in a way that would give practical results.

Steam Engines and Pump Catechisms.

Robert Grimshaw, the author of several works of a similar character, has just published "The Pump Catechism." It is intended as a practical help to miners, owners, and makers of pumps of any kind, covering the theory and practice of designing, constructing, connecting and adjusting. The little work is sold for \$1. It is intended for practical pump-users. It describes the construction and operation of all the principal types and makes of pumps; how to take down, set up, adjust and run any single one of them. All prominent pump-makers in the United States were afforded opportunity to furnish data concerning the construction, operation and setting up of these pumps. As the title describes, the work is a "pump catechism," the information being given in the form of question and answer, all in such a simple manner that any one can understand the whole subject.

Only a short time since, Mr. Grimshaw issued his supplement, or Part II of his Steam Engine Catechism, which is sold for the same price as the above work. This contains no answer or question which appeared in the first volume. The character of the matter in Part II has been largely determined by the questions which the author received from engineers and others after the appearance of the first volume. The book comprises a series of direct practical answers to direct practical questions. It is mainly intended for young engineers and for examination questions. Formulas and mathematical gymnastics are avoided. The book is not intended for professional men, but is technically correct and up to date.

These works of Mr. Grimshaw are written simply, plainly and to the point. They are illustrated and printed in a size that may be carried in the pocket. They seem to be of a very practical character, and convey the information in a way not to be mistaken. The paper is good and print clear. They are of so low a price any one interested in the subjects can afford to have them. We shall in a few days have a supply of these works on hand, and can fill any orders for them at the prices stated.

Saving Fine Gold.

The Process Carried on at Snake River.

(Written for the Press by J. S. Hunt, of Hunt's Camp, Bliss, Idaho.)

In the issue of the Press of Jan. 8th, Mr. C. Beckmyer, of Blossburg, Montana, gives an illustration of a plan of saving fine gold, especially flour gold, the main points of which have been used on Snake river for 10 or more years, a description of which I give.

The gold where this system is used is all flour gold, none being found as large as the head of the smallest pin.

The manner of getting the gravel into the ground sluice used on the gravel bars here, is by surface ditches. The top soil is broken back with a steel bar, forming a narrow channel to the gravel, and then caved down by the

the water flows and prevents the sand from bagging under the hurlap sack, which must be tight and smooth, for if it bags or bulges, a large amount of sand gathers and not as much gold is taken up as when smooth. Twice a week in winter and three times per week in summer the sacks are taken up and washed, the sand under the sacks cleaned up, the box washed off, and the drippings caught in a box hung on the lower end. Under the sacks, properly put down, there are from two to three ordinary gold pans of sand, mostly black, with some gold in it. The most of the gold, however, is found in the hurlap sacks. We use 7½ ounce, 40 inches wide hurlaps.

We here rock up the concentrates on a copper plate 16x60 inches set with quicksilver, and when sufficient is on the plate it is scraped with a knife. With us electroplated plates do not

to catch the water and sand passing through holes in grizzlies and conveying to cross-box No. 3, which is arranged so as to divide the water as near as possible into six equal parts. The cross-box at 6 slopes each way outward with the grade of ¾ inch to foot.

No. 4 represents openings in bottom of No. 2 so as to separate the water for each sack-box.

No. 5 is the head of machine, or flume, from the ground sluice, which is two feet wide for some distance to within about six feet of the first grizzly-plate, when it opens out to the width of the machine.

No. 3 shows continuation of cross-boxes leading to three sack-boxes on each side of machine leading to No. 7, where the water is turned out to the sack or hurlap-boxes No. 8, and is divided by the wings 000, Fig. 4, as many as are desired to secure an even flow of water over the hurlaps.

No. 9 represents the strip of cotton duck and strip of wood across to hold the head of the hurlaps in place.

XXX represents gates or slides to shut off the water while cleaning up a box, which is done one at a time, so as not to interfere with the flow of water over the machine.

In setting up the machines, the grizzly-frame (No. 1) should be set loosely on the frame, holding No. 2 with a grade of ¾ inches to foot, but so arranged that by wedges it could be raised to a grade of ¾ to foot, according to the nature of the soil and gravel to be run. We find ¾ inch to the foot the best grade. The sack or hurlap-boxes, No. 8, should be so set that they would have ½ inch to foot grade, and could be raised to but ¾ inch to foot, which we find best adapted to our use.

The sack-boxes are 3x24 feet long and six in number. We use from 200 to 250 miners' inches to each machine, and on a monthly run we average not far from 300 cubic yards to each machine every 24 hours. With the above-described machines we can, on gravel that averages five cents per cubic yard, have a margin of one-half profit.

In setting up a machine, great care must be taken to secure a good dump, or the machines will soon choke up.

I hope that the foregoing will be of some benefit to some of your readers in the fine or flour-gold districts. I can assure them that a large number of machines of this description are in daily use on Snake river, Idaho.

Legislative.

The Legislature has been pretty busy of late and has considered a number of bills. The Vrooman anti-dynamite bill we give on page 123 as amended. We referred fully to this bill last week, and the injustice it would do to powder manufacturers without accomplishing the object sought. The best way to stop the dynamite outrages is to punish the perpetrator. Three of these men caught in the act of exploding cartridges, or with the dangerous material in their possession, are now in jail.

The joint Committee on Mines, Drainage and Mining Debris have been this week listening to arguments on Varrel's Assembly bill and Walrath's Senate bill, providing for the impounding of mining debris. Large delegations from Yuba and Sacramento counties, representing the mining and farming interests, were present. We have given this bill in full, and it is to be hoped that the miners will have a chance to take the steps provided for in the bill. They can impound their debris if they are given a chance to do so. There will be a strong fight on this bill.

Langford's bill, providing for the repeal of the Act creating the office of State Engineer, was reported favorably, with an amendment that it shall not take effect until the next fiscal year.

There is great rejoicing among all connected with the State University over the passage by the Legislature of the "One-cent Act."

The manufacturers here condemn the Assembly bill requiring all articles to be stamped with the manufacturer's name.

Lewis' bill, creating the office of Inspector of Elevators, was recommended for passage by the Committee on Internal Improvements.

Oil men here are opposed to the appointment of an oil inspector. It is said that in this city alone fees of \$70,000 a year would have to be paid to the official appointed, as the Act now reads.

There is a measure now before the Legislature creating a State Analyst, which takes the duty of making certain analyses out of the hands of the University Professor who now has it.

MACHINE FOR SAVING FINE FLOUR GOLD.

action of the water. The lumps of soil are broken with a light pick. Direction to the water in the pits is given by shear boards. One man will harrow down enough ground in 10 hours to keep a 4x24-foot machine running 24 hours. Twenty-four feet has been found to be the best length for the grizzly, the frame varying in width from one to four feet, according to the amount of water and kind of ground to be run. Most of the machines in this locality have the width of four feet, and are composed of eight iron plates, each 3x4 feet, which are perforated with holes ½ inch between centers. The holes are punched tapering, the largest part on the bottom side so as not to clog with fine gravel. The gravel and coarser sand pass over the grizzly-plates to the dump, while the fine sand, black and gray, together with the gold, passes through the holes with a portion of the water and flows over a series of tables six in number, on which is stretched burlaps, held in place on the sides by strips held down by buttons made in the form of an eccentric. At the head of the table, or, as we call them, "sack-boxes," is placed a strip of heavy cotton duck about as coarse as the cotton grain-sacks. This is about 15 inches wide and as long as across the box. Across the top is a strip 2½ inches wide by ¾ thick, over which

work satisfactorily, as the plating soon scrapes off. A little cyanide of potassium is used, and after the plate is once set a pound of quicksilver will last a long time. We have not used 10 pounds in a year. All we lose is what is lost in retorting, which is but a nominal amount, and after retorting it is condensed and used over again, and we get very near all the gold out of the concentrates. After rocking they are thrown in a pile. Out of curiosity, I took a shovelful from different parts of the pile, cut and quartered it after the manner of ore-sampling, and sent the sample to the best assayer in the Wood River country. He reported that there was \$2 per ton in it. This was dry sand. Some of our gold under the glass shows a coating of some kind of cement which requires heat or friction to remove, so we save as large a per cent of the gold as is usual.

I give you plan and sectional views of a 4x24-foot machine, such as is used on this claim and along Snake river. The same figures refer in all views to the same parts. Fig. 1 is a section of machine 4x24 feet, with one side removed. Fig. 2 is a plan of grizzly-frame under grizzlies.

The following is the description of sketches in Figs. 1 and 2: Fig. 1 shows grizzly-plates resting on frame; 2 shows tank or sand-boxes

MECHANICAL PROGRESS.

Welding by Electricity.

Exhibition of the Process in Boston.

For the second time, within a comparatively few years, says the *Boston Herald*, a new discovery in electricity has been publicly shown first before the Society of Arts connected with the Institute of Technology of that city. Last evening Professor Thomson, of the Thomson-Houston Company of Lynn, made known to the public his new and remarkable method of welding. Up to the present the process of welding has been confined within narrow limits, the metals upon which it could be practiced being few. By the new method a broken bar of metal can be easily reunited, or bars of different metals welded together, and those metals which previously resisted welding most strenuously are now joined with ease, while those previously easily welded remain the same by the new process. Differences in specific, electrical and heat conductivity are the properties which are most troublesome. The method consists in simply forcing the ends to be welded together tightly and passing a sufficiently powerful current of electricity through the joint. The resistance raises the metal to a welding heat and this pressure makes the joint. The speaker enumerated some of the practical results obtained personally within a recent period. Iron and copper wires of various dimensions have been joined end to end. Steel or iron bars nearly an inch in diameter have been solidly welded together, and steel has also been joined to brass. A copper rod nearly one-half an inch in diameter has been welded, requiring a current of 20,000 amperes. Steel-pointed tools may be cheaply made of inferior metal and new points welded on as desired.

The cost of the new process is undoubtedly less than by the old method of forge and hammer, while the time required is very short and no heat is wasted. Mr. Thomson stated that in welding a steel bar one and one-half inches in diameter, a current of 6000 amperes in volume and having an electro-motive force of one-half a volt, was necessary. The use of 35-horsepower for one minute is another way to state it. The apparatus and methods are fully covered by patents, and can, of course, be used only by permission of the inventor, Professor Thomson.

Progress in American Locomotive-Building.

In a long and interesting letter that lately appeared in *Engineering*, continuing the discussion on English and American locomotives, from the pen of John Fernie, the following remarks are made:

During 16 years I have seen the most wonderful progress.

1. The Westinghouse brake was then in its infancy; now it is automatic and is known all over the world.

2. Steel fire-boxes were only experimental 16 years ago. Now they are universal on this side of the Atlantic.

3. The power of the engine has been immensely increased, while its cost has been much reduced.

4. The mileage of the engines has been nearly doubled, and the full value of duplicate engines proved.

5. Dining, buffet and parlor cars have made traveling by limited trains as sumptuous as royal trains in Europe; while in ordinary trains the size of carriage and the comfort and convenience of passengers have been largely increased.

6. Wagons (cars) which then only carried from 10 to 15 tons are now being increased to carry 30 tons.

7. All this has been accomplished with a great reduction of freight and passenger rates.

Now, can you point out to me any improvements in English or Irish railways corresponding to this? Further, the American engine has supplanted the English engine in Canada and is threatening to do so in the colonies. Can there be any doubt that the English engine is doomed soon to extinction, and that the American engine will take its place? And I say the sooner the better, for its use will bring better dividends to suffering shareholders and more trade to English locomotive-builders.

How Iron Breaks.

Hundreds of existing railway bridges which carry 20 trains a day with perfect safety would break down quickly under 20 trains per hour, writes a British civil engineer. This fact was forced on my attention nearly 20 years ago by the fracture of a number of iron girders of ordinary strength under a 5-minute train service. Similarly, when in New York last year, I noticed, in the case of some hundreds of girders on the elevated railway, that the alternate thrust and pull on the central diagonals from trains passing every two or three minutes had developed weakness which necessitated the bars being replaced by stronger ones after very short service. Somewhat the same thing had to be done recently with a bridge over the river Trent, but the train service being small the life of the bars was measured by years instead of months. If ships were always among great waves, the number going to the bottom would be largely increased. It appears natural enough

to every one that a piece, even of the toughest wire, should be quickly broken if bent backward and forward to a sharp angle; but perhaps only to locomotive and marine engineers does it appear equally natural that the same result would follow in time if the bending were so small as to be quite imperceptible to the eye. A locomotive crank axle bends but one-eighth of an inch, and a straight driving-axle a still smaller amount under the heaviest bending stresses to which they are subject, and yet their life is limited. During the year 1883 one iron axle in 50 broke in running, and one in 15 was renewed in consequence of defects. Taking iron and steel axles together, the number then in use on the railways of the United Kingdom was 14,848, and of these 911 required renewal during the year. Similarly, during the past three years, no less than 228 ocean steamers were disabled by broken shafts, the average safe life of which is said to be about three or four years. Experience has proven that a very moderate stress, alternating from tension to compression, if repeated about 100,000,000 times, will cause fracture as surely as a bending to an angle repeated only 10 times.

Action of Oils on Metals.

The *Journal of the Society of Chemical Industry* recently gave some very interesting data regarding the action of oils in common use upon metals, as they are brought in contact by storage, transportation and employment in the lubrication of machinery. The experiments were continued for 12 months, and are of much practical value. They were made principally with a view to determine what fixed oils are best adapted for mixing with mineral oils for lubricating purposes.

The metals were first thoroughly cleaned and then washed with ether and dried, and after being weighed were placed in cork tubes, together with the oil; the tubes being kept for 12 months at an average temperature of about 80 degrees Fahrenheit in the winter. The results of the experiments show that iron is the least affected by seal oil, and most by tallow oil. Brass is not affected by rape oil, least by olive oil, and most by cottonseed oil. Lead is least affected by olive oil and most by whale oil; but whale, lard and sperm oils all act to nearly the same extent on lead. Zinc seems, by the four actual weighings that were of any value, to be not acted on by mineral lubricating oil, least by lard oil, and most by sperm oil. Copper is not affected by mineral lubricating oil, least by sperm oil, and most by tallow oil. Mineral lubricating oil has no action on zinc and copper, acts least on brass and most on lead. Olive oil acts least on tin and most on copper. Rape oil has no action on brass and tin, acts least on iron, and most on copper. Tallow oil acts least on tin and most on copper. Lard oil acts least on zinc and most on copper. Cottonseed oil acts least on lead and most on tin. Sperm oil acts least on brass and most on zinc. Whale oil has no action on tin, acts least on brass, and most on lead. Seal oil acts least on brass and most on copper.

From the foregoing results it will be seen that mineral lubricating oil has, on the whole, the least action on the metals experimented with, and sperm oil the most.—*The Wood-Worker*.

THE PHYSICAL PROPERTIES OF MANGANESE STEEL.—At a scientific meeting in Dublin, Prof. Barrett read a paper on the above subject. He said this steel was a new-manufactured product, patented by Messrs. Hadfield & Co., of Sheffield, and possessed several remarkable properties. It had hitherto been considered that manganese was an injury to steel. In small proportions this doubtless was the case; but when the proportion was increased by 10 or 15 per cent, the steel produced had great hardness and tenacity. Moreover, it did not require hardening or tempering, but could be used direct from the casting. Heating this steel to whiteness, and quenching it in cold water, annealed it; whereas, ordinary steel, as was well known, was rendered hard and brittle by this process. But the most remarkable property possessed by manganese steel was its extraordinary magnetic inertness. The professor showed by experiments that manganese steel was practically non-magnetic, and said for this reason it was likely to become a most important material for the construction of iron ships. The large deviation of the compass on iron ships, which was so often the cause of serious accidents, would not exist on ships built of manganese steel, with cables and anchors of the same material. The professor concluded by stating that his attention had been called by a correspondent to the large deposit of manganese in the county of Wicklow, from which a tough and fibrous iron had been made.

STEAM ENGINES.—There are some engine vendors who advertise their engines, much after the manner of patent medicine vendors, as the very best for all purposes. Mr. Grimehaw expresses his opinion of such in the following manner: "There is no such engine as the 'best for all purposes.' I doubt very much whether the maker of any engine seriously claims it. All depends on the amount and class of work, the kind of boiler, the kind of engine, and lots of things. It would be perfectly folly for any one to put in a high-grade automatic cut-off engine for a plantation sawmill, where the engine would be started and stopped by whoever happened to be handiest to the throttle, and where repairs would be made with wire, and lath, and ignorance."

SCIENTIFIC PROGRESS.

The Resistance of the Atmosphere.

From Professor Langley's illustrated papers on "Comets and Meteors" in the *January Century*, we quote as follows: Everybody has noticed that if we move a fan gently, the air parts before it with little effort, while, when we try to fan violently, the same air is felt to react; yet if we go on to say that if the motion is still more violent, the atmosphere will resist like a solid, against which the fan, if made of iron, would break to pieces, this may seem to some an unexpected property of the nimble air through which we move daily. Yet this is the case, and if the motion is only so quick that the air cannot get out of the way, a body hurled against it will rise in temperature like a shot striking an armor-plate. It is all a question of speed, and that of the meteorite is known to be immense. One has been seen to fly over this country from the Mississippi to the Atlantic in an inappreciable short time, probably in less than two minutes; and though at a presumable height of over 50 miles, the velocity with which it shot by gave every one the impression that it went just above his head, and some witnesses of the unexpected apparition looked the next day to see if it had struck the chimneys. The heat developed by arrested motion in the case of a mass of iron moving 20 miles a second can be calculated, and is found to be much more than enough, not only to melt it, but to turn it into vapor; though what probably does happen is, according to Professor Newton, that the melted surface portions are wiped away by the pressure of air and volatilized to form the luminous train, the interior remaining cold, until the difference of temperature causes a fracture, when the stone breaks and pieces fall—some of them at red-hot heat, some of them, possibly, at the temperature of outer space, or far below that of freezing mercury. "Where do these stones come from? What made them? The answer is not yet complete, but if a part of the riddle is already yielding to patience, it is worthy of note, an instance of the connection of the sciences, that the first help to the solution of this astronomical enigma came from the chemists and the geologists."

COLD IN THE ABSTRACT.—A contemporary takes a somewhat humorous view of the scientific expressions for heat and cold as follows: Scientists tell us there is no such thing as cold; that heat and cold are relative terms, and that cold is merely the absence of heat. Mathematically expressed, then, heat is a plus quantity and cold a minus one, and, metaphysically speaking, one is a positive entity and the other a negative abstraction. All this is very well, but to a man with frosted ears or acute chilblains it is sounding brass and tinkling cymbals. In like manner scientists assure us that the terms up and down are merely relative, but the man who slips up and falls down knows better. No more does it help a man who is stumbling around in the darkness to assure him that there is no such thing as darkness—that it is merely the absence of light. If he feels his nose against an open door or bruises his shin over a dislocated chair, it hurts him just as bad as if darkness were a positive quantity, and in his heart of hearts he believes it is. Recurring to the case of cold versus heat, which just now is one of current interest, we respectfully submit that the scientific definition of the term cold, or the other term either, has little to do with its practical application. If a scientist's ears are nipped one of these cold mornings what matters it to him whether they are dephlogeticated or frozen? Whether the result is reached by the withdrawal of heat or the application of cold does not make much difference to the man with the frozen ears. They pain him just as much as if cold were a positive instead of a negative quality. The philosopher who, with the thermometer below zero, should apply his tongue to a street-lamp post or a water hydrant might get a great deal of personal satisfaction by explaining that the mutilation of his tongue was due to a sudden abstraction of heat, but every newboy and street-gamin would know that it was caused by the cold.

EXTINCTION OF AFRICAN GAME.—Nothing can convey a better idea of the astounding rapidity with which the nobler game are being cleared from the face of the earth, and especially in South Africa and North America, than a chat with a London hide-broker, or a visit to the crowded leather warehouses and wharves of Bermondsey. A firm of hide-brokers has for some two or three years past had an standing order to obtain in one lot, for some continental clients, 500 quagga skins. Ten years ago such an order could easily and rapidly have been executed, but now it is an impossibility, for, instead of arriving as they used to in hundreds and thousands from South Africa, quagga hides now only appear in dribble of from 10 to 30 at a time, and then principally from the Zanzibar coast. In fact, the rolling plains of the Orange Free State and the High Veldt of the Transvaal, whereon the quagga, in company with wildebeeste (gnu), blebokke, springbuck and ostriches, formerly grazed in countless thousands, are now absolutely denuded of these beautiful creatures, and their ancient habitats know them no more. With the introduction of breech-loading weapons the Boers began a war of extermination upon the fauna that formerly

imparted an air of grace to many a dreary landscape, and the laden wagons of the "skin-hunters" rolled incessantly to Port Elizabeth and other markets. Then English hootmakers made the discovery that the hide of the black wildebeest and the quagga, particularly the latter, made the finest quality of so-called porpoise hide, now much in request for walking hoots. The new demand completed the ruin of these quadrupeds, which are now all but extinct south of the Tropic of Capricorn.—*London Globe*.

THE DATE OF DEATH.—M. Megnin claims to be able to determine the date of death by studying the generations of acarina, which have been at work upon the body. Brouardel produced the cadaver of a young woman before the French Academy of Medicine, which had lain in a cellar for a year. He was able to trace five different species of acarina, and the order of succession and duration of each species. One species consumes the fatty acids, another absorbs the fluids, and each dies when its work is ended. The period of life of each in summer is from six to eight weeks. In a case of murder in which the remains of the victim were discovered in a garden, Megnin was able to establish the date of burial with great accuracy. The value of these observations and deductions, if confirmed, cannot be overestimated, as barely a month passes without the discovery of a murdered body, and in the course of the prosecution the probable date of death is always an important factor. So far as we know, no one has taken up this work of Megnin, Brouardel, and Laboussiere in this country, yet it would seem that no field offers more inducements to the medico-legal expert than the one just opened by these enterprising French savants.—*Science*.

DEVELOPED FORCE.—"Force," says Prof. Pierce, "seems to have a spiritual origin." Its actual nature, science has not determined. We recognize the existence of force through the observed effects it produces. Force is the universal cause of change, always operating in connection with matter, and ever persistent in maintaining its integrity, so that the sum of its efforts is constant. It is developed in various forms—as in attraction and repulsion—in motion and its equivalents, heat, light, electricity and galvanism. It acts upon the atom, molecule, particle, body aggregate, world, sun and systems. Developed as heat from the sun, force lifts the waters to the clouds, whence, by the force of gravity, they descend to earth and flow as a mechanical power in their course back to the sea. Also coming in the forces of heat and light from the sun, force induces vegetation and builds up forests. These, in the cycles of change, are prostrated and buried for ages, but in their sepulcher embrace their parent force, which, in the meantime, transforms them into coal, from whose combustion it rises Phoenix-like, in all its integrity and pristine energy.

THE RINGS OF SATURN.—The constitution of Saturn's rings, and questions connected with them, are now prominent themes for the attention of the men of science. Opinion is divided about a dark line in the outer ring, whether it be produced by a darker shading of the ring or whether it be the sky beyond showing through the opening. If a star or other object should be seen through the dark spaces, the question would be settled. Some astronomers of note think that the rings are approaching the planet. Measurements of exceeding delicacy will be required to establish this theory. Saturn's oppositions will afford the best conditions for seeing stars in the dark spaces between the rings, and finding if the distance lessens between the body of the planet and the rings. One only needs to look at this wonder of the skies through a good telescope to realize, in some faint degree, the practiced hand, the delicacy of vision, the activity of brain and the profound scientific preparation required for a solution of either problem.—*Providence Journal*.

HOW TO CURL AN OSTRICH PLUME.—Have ready some corn cobs and common salt, and let the fire in the cook stove burn down till you have a good bed of coals, lay the cob on and sprinkle them with salt, and shake the feather in the smoke. Add cobs and salt from time to time, and be sure to shake the plume well, turning every part to the smoke. The harder you shake the feather the better it will look. Be careful to keep it far enough from the fire to keep it from burning. The livelier the coals without blaze the better. I have tried to make this plain. I thought my plumee completely spoiled till I tried this receipt. I saw a milliner wash a white plume once and recurl it this way, and it looked as nice as new. She washed it in lye and rinsed it in clear water, and shook it vigorously until about dry, and then shook it over the smoke.

THE HEATING VALUE OF COAL.—Although instruments for the precise estimation of most of the agents of our industries have long been introduced, the heating value of coal—the great natural source of power—is rarely tested calorimetrically, even by the largest consumers. At present the different qualities of coal are known as firsts, seconds, etc., whereas a calorific estimation might show that the seconds, or even inferior qualities, possessed a higher calorific efficiency than the firsts. By the utilization of fuel calorimetry a user of coal may be able to ascertain exactly the financial value of different fuels, and to compute the heat energy possessed by the fuel with that economically evolved.

County Boundaries.

The Committee on County and County Boundaries of the Assembly has decided to allow the people of the section proposed to be divided from Colusa county to vote on the question. This will probably result in a division of the county. Colusa county contains 2300 square miles and is larger than either the State of Delaware or Rhode Island. There is considerable rivalry existing between the towns of Colusa and the Willows, in the northern part of the county, but should the citizens of the aforesaid section conclude to separate, it will doubtless be owing to the fact that their interests can be more conveniently and economically served thereby. The chief interest that gravitates around this local agitation, should it result in a division, is the probable effect it may have as a precedent. Other counties may catch the division fever. In point of size, California is the second State in the Union, containing 155,000 square miles, and yet has only 52 counties, while New York has 60, Ohio 88, Virginia 100, Kansas 104, Missouri 114 and Texas 179. Only those who have taken pains to study their geography are aware of the territorial extent of some of our counties. San Bernardino has an area almost equal to that of West Virginia. The following table may give our readers an idea of the extent of some of our larger counties:

Counties.	Square Miles/Land Surface.	State.	Square Miles/Land Surface.
Fresno	8,094	Connecticut	4,845
Humboldt	4,094	Delaware	1,960
Inyo	10,156	District of Columbia	60
Kern	8,100	Maryland	9,860
Lassen	4,750	Massachusetts	8,049
Los Angeles	4,812	New Hampshire	9,005
Modoc	4,297	New Jersey	7,455
San Bernardino	21,172	Rhode Island	1,085
San Diego	14,959	Vermont	9,135
Siskiyou	6,078		
Tulare	6,406		

It is a little rough to compel a man to travel from 60 to 100 miles to put a deed on record or attend court as a juror or witness. This inconvenience may be patiently endured in a thinly settled county, but as the population becomes dense and business at the county seat increases, it would not be strange if the people became uneasy and demanded more compact county facilities.

Calaveras County Mines.

Probable Reopening of the Gwin Property.

The Calaveras Prospect of a recent date says: One of the latest and most striking evidences that our county is to have a renewal of prosperity that will far eclipse anything Calaveras has yet experienced, is the almost entire certainty of the reopening of the Old Gwin mine. This property proved one of the best paying investments in the county till shut down on account of the formation of the walls being such as to cause fear of their caving without a different system of timbering. To make this necessary change would entail a heavy expense, therefore making it especially worthy of note that men of means have sufficient confidence in the staying qualities of our quartz lodes to make this necessary outlay before solving the hidden mysteries of this mine, which will be seen by the subjoined extract has already been worked to a considerable depth. Further reasons for our belief in the brilliant future of gold mining in this county are based on our knowledge of the immense quantities of low-grade ore that the surrounding hills contain, and the study rich corporations and private capitalists are making of the most recent inventions for extracting the precious metal at small cost. We no longer need to have ore in which free gold is seen to hang to feel confidence in it being pay rock. Beside these indications is the one on file at the county clerk's office—mining locations. There has never been a time in the county's history when the prospecting and locating equaled what to-day's records show. Develop your prospects so as to show to capital what you have, and you may be assured that you will have little difficulty in disposing of your property at a fair price. The following we clip from the Calaveras Chronicle of January 29th:

"A Mr. Conzelman, of St. Louis, arrived here last Monday evening and remained two or three days. We learn that the gentleman named had come to get information concerning the Gwin mine, in the interest of a company to which he is to report the result of his investigations. In the absence of Mr. W. M. Gwin, who is the owner of the mine, and who is at present in the East, Mr. Conzelman sought information from responsible parties, visited the mine, and spared no pains to ascertain all the facts, interviewing the men who had been at work in the mine just previous to its closing down. Although we have no assurances of the matter, the prospects are that in the not distant future there will be operations commenced on this valuable mine. That it is a valuable piece of mining property, explorations have proven. The shaft reaches a depth of over 1500 feet, with a splendid body of paying ore, and the requisites are heavy appliances in the way of machinery to reundertake the work."

Further information of negotiations confirms the belief that the reopening of the mine by the St. Louis company is a settled fact.

USEFUL INFORMATION.

The Trade Dollar.

A cotemporary furnishes the following facts in regard to that much-abused coin—the trade dollar: The trade dollar has no monetary value, although by an oversight in the bill authorizing its coinage it was made a legal tender like other silver dollars to the amount of \$5. Not being a Government coin, money-brokers made them a source of speculation, and placed them at a heavy discount. When the mistake and its consequences were brought to the attention of Congress, the legal-tender clause of the bill was repealed, and afterward the coinage was suspended. Its full value here, then, is simply what it is worth as so much bullion, which fluctuates from day to day, but does not vary a great deal from 50 cents. An effort was made some time ago by bankers and other money speculators to get the Government to redeem this trade dollar with gold at par. The effort failed, and there is now a bill before Congress, and which may pass, authorizing the Treasurer to redesign them with standard dollars at par. The Government cannot lose much, if anything, on this proposition, as the trade dollar actually contains more pure silver than the standard dollar contains. In the intrinsic value they stand relatively thus: The trade dollar weighs 420 grains, 900 fine, and contains 378 grains of pure silver. The standard dollar weighs 412½ grains, 900 fine, and contains 371½ grains of pure silver. The Government will only be at the expense of recoining, which will be almost if not quite compensated by the difference in intrinsic value—about 7½ grains of pure silver in favor of the trade dollar. The trade dollar not being lawful money of the United States is not current, consequently is not used in traffic. Banks and money-brokers buy them at their market value as bullion.

[The only objection against the Government redeeming trade dollars in gold is the fact that they are now all in the hands of speculators who have bought them up at prices generally below what they can now be sold for as bullion. Hence the only persons to be benefited are moneyed speculators, who have no claim upon the Government for special legislation. Government is under no obligation, and should not aid speculators in trade dollars any more than it should speculators in any other kind of merchandise.]

WHAT A WONDER BALL IS.—There is a fancy that has been brought over by our German friends from the Fatherland. It is known as a "wonder ball," and is already rolling on its way. It is of German origin, as the motive connected with it will show; for, as a people, the Germans, more than any other, invest the common affairs of life with an atmosphere of sentiment. The wonder ball is a form of gift—many gifts in one. The friends of the one who is to receive it are in amiable cahoots together, and by their united efforts it is produced. An amount of bright wool is bought, say enough for a shoulder shawl, or even for an Afghan. The gifts, which should be of small bulk, are wrapped in paper, with the giver's name, a note or any other personal remembrance affixed, and then the yarn is wound about one until it is covered, when another is added and the same process repeated. This goes on until all the gifts are included in the package, one at a time, each interwoven with its concealing web of threads. Now comes the charm. The receiver is requested to knit from that ball, or to crochet any article she may choose to fix upon, and not by any chance to unwind the yarn only so fast as the work progresses. It is like undoing a long Christmas stocking with presents in it down to the very toes. And see what a stimulus to industry! Curiosity will grow stronger as each gift appears, and the work is pretty certain to be swift and soon completed.

A NEW PATENT BARREL.—Another barrel has been patented, and when manufactured on a large scale and introduced to the trade, promises to become a popular package. It is made of hard and soft wood, each alternate stave being of the soft variety and slightly thicker than the hardwood stave. The edges of the staves are cut square, and when placed together to form the barrel the outside are even and there is a V-shaped crack between each stave from top to bottom. The driving of the hoops forces the edges of the hard staves into the soft ones until the cracks are closed and the extra thickness of the latter makes its inner edges lap over those of the hardwood staves, making the joint doubly secure. This invention has been perfected by Charles Espenschied, of Hastings, Minnesota, and his foreman cooper, and promises to make a revolution in the cooperage business when introduced.

KEROSENE OIL IN WASHING.—Those who have tried it are enthusiastic on the use of kerosene oil in washing clothes, because it does at least four things, viz., it eases time, it saves labor, it saves the goods and it cleanses the clothing more thoroughly than by any other method. Fill a good-sized washboiler with water, adding a pound of ordinary washing soap, shredded fine, and when the soap is dissolved, two and a half tablespoonfuls of the kerosene oil. When the water has come to a boil, put in the finest white goods, turning them over occasionally, and taking them out in 10 minutes;

then place in clear, hot rinsing water, and from that into the bluing water. No rubbing is required ordinarily, and the clothes are soft and of a dazzling whiteness. Should any speck of dirt remain, a slight rubbing with the hands will remove it without the addition of more soap. When the finer goods are taken out of the boiler, coarse goods can be put through the same process, thus flannels (white) and then towels, after which the water is still serviceable to wash colored goods. Should the water be low, add more, and also a half pound of (shredded) soap and another spoonful of oil. That is all there is about it, and if these simple directions are followed the terrors of washday will belong to the past, and hundreds of toil-worn women will take on a new lease of life.

TO CLEAN HAIR BRUSHES.—The best way in which to clean hair brushes is with spirits of ammonia, as its effect is immediate. No rubbing is required, and cold water can be used just as successfully as warm. Take a teaspoonful of ammonia to a quart of water, dip the hair part of the brush without wetting the ivory, and in a moment the grease is removed; then rinse in cold water, shake well and dry in the air but not in the sun. Soda and soap soften the bristles and invariably turn the ivory yellow.

DOWN DRAUGHTS IN CHIMNEYS may be obviated by a recent English device. It consists of a number of grooved rings placed over each other with spaces between and made of metal or clay. The grooves are so shaped that when the wind strikes them it is so deflected that it draws air up the chimney, and in this way effectually prevents down draught.

A SILVER SURFACE FOR IRON.—An ingenious process for giving silver surface to iron has recently been devised in Austria. The iron is first covered with mercury, and silver is deposited upon its surface electrolytically. The iron is then heated to about 300° C., and the mercury evaporates, leaving the layer of silver upon the surface of the iron.

THE circumference of a circle is 3.1416 times its diameter.

GOOD HEALTH.

Healthful Breathing.

Tight lacing and lazy ways of breathing, says Helen C. Swazy, in *St. Nicholas*, prevent the lungs of the adult woman from getting enough exercise for their own good.

It is well to establish the habit of deep breathing, but, in addition to this, the reserve air which is left in the lungs after an ordinary expiration should be expelled, and the lungs thoroughly ventilated at least twice every day. First, then, see to it that the air in the room is as pure and fresh as out-of-door air can make it. Then, with all tight and superfluous clothing removed, lie flat on the back, and, with the mouth firmly closed, take a full deep breath. Hold it 8 or 10 seconds, and then let it out. Take another, and yet another breath, in the same way.

After that, take a breath into the lungs as slowly as possible, beginning to fill them up at the lowest extremities, and inhaling gradually until they are filled to their full capacity, when the air should be exhaled in the same slow and steady manner in which it was taken in.

When you have taken this movement again, to make sure that the shoulders are in good position, throw your arms vertically over your head and take another quick, full inspiration, swinging the arms rapidly to the sides close to the body and back again over the head. Swing the arms up and down four times on the same breath, and repeat the exercise three or four times.

After this it is a good plan to stand erect, with the arms horizontal at the sides, and vigorously clasp the hands from that position over the head a few times. When taking such movements in an erect position, always keep the chin two or three inches back of the vertical.

A few such exercises as these, for 5 or 10 minutes at night and morning, will promote refreshing sleep and give increased vitality.

CURE FOR DIPHTHERIA.—Dr. A. Brondel writes, in the *Bulletin General de Therapeutique* of Nov. 15, 1886, concerning the treatment of diphtheria by benzoate of sodium, and asserts that of 200 consecutive cases he has not lost a single one. He admits the possibility of a mistaken diagnosis in some instances, but, even excluding 50 per cent on this account, he still has 100 cases without a death. His method is as follows: Every hour the patient takes a tablespoonful of a solution of benzoate of sodium, 15 grains to the ounce, and at the same time one-sixth of a grain of sulphide of calcium in syrup or granule. In addition to this the throat is thoroughly sprayed every half hour with a ten per cent solution of benzoate of sodium. This is done religiously at the regular intervals, day and night, but no other local treatment is employed. No attempt is made to dislodge the false membrane, and no penciling nor painting of the fauces is resorted to. Tonics are given and antipyretics are used when occasion calls for them. The nourishment consists of beef juice, tender rare meat, milk, etc.; but bread and all other articles which may cause irritation of the throat are

forbidden. The sickroom is kept filled with steam from a vessel containing carbolic acid, turpentine, and oil of eucalyptus in water.

The employment of benzoate of sodium is not a new method in the treatment of diphtheria, for it has been tried and is recommended highly by Letzerich, Kien, Ferrosol, and others. But this, of course, speaks so much the more strongly in favor of the remedy; and as Dr. Brondel's results were better than those obtained by others using the same drug, it is to be presumed that his method of employing it is the best.—*Medical Record*.

To Cure a Felon.

The *Boston Transcript* says: That woollen smoke is a cure for a felon is certainly one of the medical discoveries of the age. Could we give the name of the correspondent who sends us the following, it would be at once recognized as of authority sufficient to guarantee the truthfulness of any assertion to which it might be appended:

"If you ever endured the agony of a felon, you will appreciate the fact that it can be cured by woollen smoke. Place the woollen rags under an inverted flower-pot, and put coals upon them, or set them on fire some other way, then hold the felon over the smoke, and it will extract all the pain. This has been done by a friend of mine within a week. I assure you that in my circle we consider it as great a discovery as that ether will temporarily deaden pain. The only remedy for a felon that I ever considered infallible, and I have had cognizance of several aggravated cases, was having the part laid open (under the influence of ether) and the bone thoroughly scraped. That reaches the root of the difficulty; but the smoke cure is far better. I once took a woman to a hospital, and charged the attendants to see that the ether was administered previous to the operation; but they broke their promise, and it took two men to hold the poor girl during the operation, after she had suffered untold distress with her finger for three weeks, which distress I had shared."

[Should any of our readers have occasion, and think proper to make use of the above remedy, we should be much pleased to hear of the result, whether it be favorable or unfavorable.]

WRITER'S CRAMP is an affection which, until a very recent date, has been looked upon as in most cases incurable. Fortunately, however, for those who suffer from this disease, means are now known to exist not only for its amelioration, but for its permanent cure. The difficulty is one which is not, as its name implies, confined to writers. It may occur in any individual whose occupation brings into constant play one set of muscles; thus the pianist, the telegrapher and the ballet-dancer may suffer from these cramps or from an inability to perform the acts peculiar to his occupation. The cramps are merely symptoms of a diseased condition, the exact seat of which is a matter of dispute, some locating it in the brain, others in the spinal cord, while there are those who regard the nerves centers as in no wise affected, but trace the source of the affection to the nerves themselves. The method of treatment which has been found most successful consists in the application of gymnastics, combined with massage, to the affected muscles. The rubbing, and sometimes a gentle striking of the muscles with a wooden bar, together with regular movements of the fingers or other defective part, are continued for several weeks, during which time not more than one hour daily is devoted to these exercises. During five years, Wolff, who has given special attention to this affection, has treated 277 patients. Of this number 245 were writers; 32 were pianists, violinists, telegraphers and painters; 157 were cured, 22 improved, and 98 not cured.—*Science*.

THE MUSCLES OF MAID AND MOTHER.—It has been suggested to us that the effect of the athletic exercises now common among girls, if these are really beneficial, should have begun to appear in the physique of women of the present day, and to show itself in greater fitness for the duties of maternity. Medical men in practice might, no doubt, throw some light upon this question. To our mind there seems good reason to believe in the generally beneficial effect of all such means of educating muscular power if they be used in moderation. Besides the intrinsic property of increasing vigor and agility, they necessitate a greater freedom from the rigid restraints of dress which were usual 20 years ago. They imply, moreover, a liberal allowance of fresh air, and, by encouraging vital changes throughout the body, combat that dislike of food which is so common among young girls of listless habits. Thus, in various ways, their tendency is to strengthen and stimulate the whole system. There can, we think, be little doubt that the woman who has grown up under this wholesome training is the fitter in consequence to bear the lot of her sex in married life. Her nerve will be stronger, her muscle power greater and each natural function proportionately more active.—*London Lancet*.

LADY DOCTORS IN THE FIFTEENTH CENTURY.—Dr. Horowitz, of Frankfurt-on-the-Main, has published a work entitled "Jüdische Aerzte in Frankfurt," in which the learned author mentions the interesting fact that as long as 450 years ago, Jewesses practiced medicine in that city; they especially devoted themselves to ophthalmia.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

OPENING UP THE COAL.—*Livermore Herald*, Feb. 12: A little over a year ago, Jenkins Richards, the well-known miner, who has been connected with the Livermore coal mining district almost since its discovery, began a tunnel to open up the upper and larger coal vein on a level. This work was begun as the result of a contract made with Messrs. Stevens & Wynn to work the vein on their ground on a royalty. Beginning near his old works, Richards ran in 300 feet, when he struck the vein, as he expected. He knew before starting that there was a break in this vein, but supposed it to be somewhere from 20 to 100 feet in width. He therefore turned his tunnel, and followed across the break, guided by the broken chunks and masses of coal. The formation was hard, his effort to form a company proved fruitless, he had very little money, he was offered a good salary to accept a position as a mine foreman in Texas; but notwithstanding all, Richards kept pegging away at the solid rock in his tunnel, with a grim determination, and a "stick-to-itiveness" worthy of hearty commendation. One hundred—two hundred feet—and still not a sign of the vanished coal vein, other than the broken masses of coal scattered here and there by the mighty convulsion of nature which rent this mountain thousands of years ago.

Amador.

PLYMOUTH.—*Dispatch*, Feb. 12: Dr. A. C. Smith, of this place, who has made a small fortune through his practice since he came to this town some ten years ago, has formed himself into a company of one and has commenced operations on a mine situated west of Nashville. He has bought the heavy hoisting works that have lain idle at the old Alpine mine for several years, and had them moved to his mine. Although the recent heavy rains have hindered work to some extent, he is pushing the matter vigorously. The mines belonging to the Plymouth Con. Mining Co. are in excellent paying condition, as evidenced by the facts that the 80 stamps of the Empire are constantly kept in motion grinding out the valuable metal, and that the Pacific mill is being enlarged by 40 more stamps. This work is being rapidly pushed by an excellent millwright from the Bay city. A pit had to be dug in solid slate rock large enough to admit the entire new mill. A large force of men and several teams were employed some four weeks in digging it, it being some ten feet deep in the rear end, into which the millwright fell some time ago and was carried to the hotel in a serious condition, from which he has barely recovered. The appearance around this mill reminds one of a young lumber yard. The lumber was obtained from the Tarr mill, and is acknowledged to be the best lot of building lumber that has ever come into Plymouth. Sinking on the New London is being pushed in earnest. They are now down about 700 feet and have an excellent ledge of fine ore. It is said that when they reach a depth of 1000 feet, and the ledge continues good, a large mill will be erected. The Chicago mine is a new mine just opened southwest of the Pacific. Recent developments have proven this to be a first-class mine.

OLETA.—*Cor. Amador Ledger*, Feb. 12: The Marble Co. is talking of cleaning out its ditch, and taking water from Dry creek as of old. Mr. McAdams, the superintendent, is putting the mill in good order for sawing. There is scarcely any mining being done around here this winter, owing to a scarcity of water.

PINE GROVE.—Mining is at a standstill around Pine Grove, except with James & Son, who are prospecting their quartz mine.

SUTTER CREEK.—Work at the Wildman mine has been materially retarded by the storm. The hoisting works, however, are almost completed, and the building over the shaft has been commenced. The Lincoln mine came to a standstill this week, to remain idle for some time. The water being available for the Mahoney mill, the entire 40 stamps were started, and will be kept in motion steadily. Three or four men have been put to work on the North Star claim, between here and Amador, just south of the Talisman. This mine was bonded recently to San Francisco parties for \$27,000. E. C. Voorheis has also bonded his claim between here and Amador City, and work thereon is to be commenced soon.

Calaveras.

WEST POINT.—*Calaveras Chronicle*, Feb. 12: The Keltz mine is turning out the usual amount of first-class ore. The richest ore exists in the bottom levels. The ledge is from two to three feet in width, being a solid compact mass of mineral, and ranging from \$200 to \$1000 per ton. Ore is being continually shipped to Selby's Reduction Works.

THE SCORPION MINE is extracting ore at a lively rate, supplying the mill to its utmost capacity, which is a Tustin Wet Pulverizer. Concentrations are also shipped to Selby's.

THE STAR OF THE WEST is turning out sufficient ore to keep the mill in full blast. The ore is being taken from the upper levels.

THE LOCKWOOD MINE is in full operation. Size of ledge in shafts, levels and stopes is from three to six feet wide. The ore yields \$130 per ton. The mill is taxed to its fullest capacity. This mine, like the Keltz, is paying large dividends.

INDIAN CREEK.—*San Andreas Prospect*, Feb. 4: John Salsure and George Hengen are prospecting a claim known as the Christmas Gift, one-third mile east of the Esmeralda mine. A shaft has been sunk 30 feet and they have a ledge two and one-half feet wide on the bottom. The gentlemen have traced the vein for several hundred feet on the surface and have found good prospects. The quartz carries sulphurets containing a large quantity of galena. Messrs. Demorest and Moore are prospecting on the west extension of the Esmeralda mine. It is their intention, so we are informed, to erect a 10-stamp mill in the spring. They have quartz that will justify them in making extensive improvements. Adjoining the Demorest and Moore mine on the west is the Narragansett claim, owned and worked by W. H. Mathewson and Dave R.

Oliver. Mr. O. has recently leased the Bonanza mine in Sonora. The Narragansett mine has been prospected for years, and is thought to be one of the best mines in that vicinity. Messrs. Oliver and Mathewson have located a mill-site and water right, and intend to open up their claim in the spring. The Cunliffe mine is being worked by a company, the name of which we failed to learn. The main shaft is 100 feet deep on the lead and drifts have been run each way on the vein at the 100-foot level. A five-stamp mill is kept running steadily on good milling rock. William Crews and Cyrus Davis are working the old Mt. Vesuvius claim on the ridge between Indian creek and San Antonio creek. The rock from this mine prospects well. Considerable work is being done on the Bosco mine, owned by J. B. Reddick, F. J. Solinsky and Cunio and Dasso. The Cunio Bros. are working the mine and they have taken out some fine-looking rock lately. Frank Silva and others are prospecting on a lead near the Bosco mine. They have taken out some very rich rock this last week.

MURPHYS.—*Cor. Mountain Echo*, Feb. 12: Mining is looking up on all sides of us; a deep interest is being taken in prospecting, resurrecting old mines, and increased activity in those which are now being worked. In the Indian Creek district, prospecting is being vigorously prosecuted, and many locations have been made, some of which bid fair to prove good. The Oro Plata is running on full time, with a full complement of men. It is said that the Burleigh has disclosed a rich body of ore on the 100-foot level. Two Burleigh drills are used in this level, one in crosscutting and one stoping. The 15-stamp mill and all of the pulverizers are in motion day and night. So far, the storms have not interfered with the extraction of ore in the large pit, and henceforth many of the obstacles that retarded work from the storms last winter will be obviated this winter. The Cunliffe & Driver mine, on Indian creek, is worked economically and successfully; their 5-stamp mill is run only about 12 hours in 24, on account of the scarcity of water. A \$1600 cleanup was made recently on a short run, and rock of the same rich character is being extracted for reduction. The mine is sure to prove remunerative. The Esmeralda, also on Indian creek, is keeping up its reputation as a gold-producing mine; the first run of two weeks of the new 10-stamp mill yielded \$2300 in bullion. The mine is looking well, and will doubtless richly reward the lucky owners. To the south of us, in the Williams range, two miles from here, excellent prospects are found, and the Silver Reef mine, hitherto worked by Geo. Taylor, now bonded to expert Tulloch, looks well enough to erect a mill on it, and they have this project in contemplation. The gravel mine of McCormack & Co., on Central Hill, is worked with Mc's usual energy and ability, and the next cleanup will be a big one. These gentlemen have expended considerable money in fitting up their claim, and are deserving of the success they are sure to meet with.

STAMPS RUNNING.—*Calaveras Prospect*, Feb. 11: The Union mining management believe, not in "making hay while the sun shines," but in making a large return of gold while the water lasts. Are running 30 stamps on full time, and we look for big returns next cleanup.

BANNER MILL.—In a few days the work of making a number of needed improvements will be commenced on Banner Mill, such as putting in new underpinning, etc.

El Dorado.

IDLE.—*Placerville Observer*, Feb. 15: Most of our mines are idle, owing to the fact that there has been no water in our large canals. We understand a large amount of snow has fallen on the mountains during our late storm which will insure water for all when it is turned on.

NASHVILLE.—Nashville is located on the Cosumnes river in the southeastern part of the county. Nashville enjoys the distinction of being the oldest quartz-mining camp on the Pacific Coast, and in the palmy days of long ago she rejoiced in the name of Quartzville. It is here the first stamp mill in this State was erected, in 1850. The machinery was made in Cincinnati and shipped around the Horn in '49 for the old Tennessee mine, now known as the Nashville mine. The stamps were of oak, 10 inches in diameter, and shod with iron. Near the site of this ponderous affair stands a fine 20-stamp mill, erected by Joshua Hendy a few years ago, and which is now idle, the result of mismanagement and litigation. When litigation, which has been the bane of this mine, is at an end, it will once more take its place among the dividend-paying mines of the State. It has been developed to the depth of 600 feet, the greatest depth attained in this district. The vein is large and well defined between slate walls, and pays from \$7 to \$10 per ton. Adjoining the Nashville mine on the north is the Cumberland, once known as the Montezuma mine. It was discovered and worked in the early days by Mexicans. A few years ago Hart and Griffith got hold of the mine, and, erecting a 10-stamp mill, crushed a lot of old dump thrown aside as worthless in former years, realizing a handsome profit therefrom. Lacking the means to put up suitable machinery and open up the old shaft, when they had exhausted the old dump and all the quartz obtainable, they, with their limited means, had to abandon, and nothing but assessment work has been done since. The shaft on this mine is 240 feet deep with drifts north and south on the vein, which is a true fissure averaging about three feet in width of high-grade ore. Other openings develop a separate and compact ledge of lower grade ore.

Fresno.

HILDRETH MINES.—*Fine Gold Miner*, Feb. 12: In the Texas Flat mine, owned by Haggins, Hearst and J. M. Wilson, a very important discovery has been made. It seems that a gopher, while digging deeper into the earth, brought to the surface some loose quartz containing gold, which exposed to view wire gold. From this hint the company started to open up the ground, and had not gone far before a fine two-foot quartz ledge was discovered. The company has started to sink a working shaft upon the find. McNally & Co. have opened up a good body of ore in the White Rock mine in Fine Gold District. Heretofore they have been sinking a working shaft, and only lately commenced drifting to the ledge. They happened to hit the pay chute a few days ago. The Buckeye mine, owned by Overton & Keller, is the extension of the Rough and Ready mine, and the face of the tunnel which they are drifting looks unusually well. From wall to wall

the ledge averages one and one-half feet in ore that mills \$28 per ton in coarse gold, and the sulphurets in this prospect are very high grade, assaying back from the face of the tunnel 38 feet, on an average of \$500 per ton. The Patterson mine is the extension of the noted Wilson Prospect, and the owner has lately opened up a fine two-foot ledge that returns assay value of \$40 per ton coarse gold. The Wilson mine and ledge is improving as they attain depth in the shaft. The ledge in this property has always given satisfactory results by assay, from the top to the present sump, and is considered by experts to be a fine property. The Promontory mine, owned by James Ryan and others, is a good proposition. The ledge averages one and one-half feet, and will prospect \$25 per ton, while the ledge matter incased between the walls is four feet wide, and also prospects in coarse gold. The Bonanza Queen mine, that was lately sold to Taylor & Frazer, has turned out to be a very good investment. The ledge and ledge matter prospects well, is three feet thick, averages two feet, and will mill \$50 per ton.

The Cascade quartz mine is the oldest mine in that section of Fresno mining district, and through its owners, the Baker Bros., has been the cause of the late discovery of the Bonanza Queen, Promontory and Rough and Ready mine. The Cascade ledge owners, who comprise at present the Baker Bros. and F. C. Scully, of San Francisco, are drifting in on the ledge, which is in 75 feet. The ledge at the face is 1½ feet, with clay selvages on each wall, being incased with porphyry as country rock. The tunnel will top the ledge below the sump of the working shaft 125 feet. The ledge will mill \$35 easily in coarse gold, and the sulphurets will average \$300 per ton. The French Co. has decided at last to start up the Quartz Mountain mine by sinking the shaft (which is on a 10-foot ledge) 200 feet deeper, in hopes that the ledge will come in on higher-grade ore. At present the ore and 10-foot of a ledge only average \$12 per ton. The same size ledge in any other formation and location would be a big thing, and if the ledge opens up at 200 feet deeper \$25 rock, the company will have use for their 60-stamp mill. The Dahlonoga mine is the south extension of the Blue Streak mine, that was lately bought by Haggins & Co. The Dahlonoga property is, in fact, as good a mining proposition as the Blue Streak, having a five-foot ledge from wall to wall; and, to use the expression of John O. Earl and other experts, it is as good as the Haggins property. The present depth of the working shaft is 45 feet, on a ledge that will mill from \$35 to \$40 per ton of good-milling quartz. Superintendent Wallis, of the Hildreth mine, is having the water lowered at a fast rate, and inside of five days the mine will be pumped dry. Miners will be put to work sinking and drifting to an advantage. All the levels contain ore that has milled from \$45 to \$65 per ton, and some very rich nuggets have been brought to the surface during the life and management of the late Thomas Hildreth. The George mine is considered one of the best prospects in the section for the amount of development done. The ledge is incased in walls of granite, averages in size about 1½ feet, assays \$25 per ton, and has a dip of 45 degrees. Last week Frank Hammack and A. Brant worked 16 tons of their ore and obtained \$400. The late discovery in the Ahby mine is the opening up of a new body of ore, separated from the gold-bearing ledge, that assays \$420 per ton in silver. The Fine Tree mine is at a depth of 800 feet in their incline, upon a 3½-foot ledge, that mills \$60 per ton. The ledge dips 45 degrees, and its hearing is north 20 degrees east.

Mariposa.

BUENA VISTA.—*Mariposa Gazette*, Feb. 12: Mr. Emanuel San Pedro just returned from the metropolis, where he has been a few days purchasing an outfit of machinery for the Buena Vista mine. He is a live mining man, whose keenness and practical sense can penetrate a mine far ahead of the drill and pick, and who will in due time be able to answer the problem whether the gold-bearing quartz of Mariposa county, or of Saxtons' creek, go down into the bowels of the earth or not. Mr. Pedro is an enthusiastic and industrious miner, and we feel assured that another 30 years will not be allowed to pass before some legitimate prospecting and work is done in our mines and some paying developments made that will be satisfactory.

Mono.

MONOVILLE.—*Bodie Miner*, Feb. 12: The ore chimney recently struck in the north drift, 150-foot level of the Rattlesnake mine, has been cut through to the distance of 10 feet, the vein being 20 inches wide, all of ore that assays up into the thousands of dollars. The south drift on the same level is in over 100 feet and in very good milling ore. Everything about the mine is in good working order and the arastras will be started up within a week or 10 days. The incline shaft on the Corinthian mine is now down 93 feet and the ledge looks more compact than at any time heretofore. The quality of the ore has also considerably improved. The owners of the Blackstone mine intend to soon commence sinking on the ledge; then look out for rich developments.

Nevada.

WASHINGTON DISTRICT.—*Nevada Transcript*, Feb. 15: Two and a half years ago the *Transcript*, after careful examination and inquiry, asserted that the Washington mining district would eventually prove one of the best in the county, and the equal of any in the State. The district is to-day fulfilling all this paper's prophecies and the writer candidly believes the near future will astonish even the most enthusiastic now. All the indications point to a very successful year in that section. Prospecting for new ledges is being carried on in every direction. Men can be seen scouring the mountain-sides and peering into the gulches and canyons in every direction from Washington, and frequent finds of promising ledges are reported occasionally; but particulars are not given as we would like to have them. Those familiar with the district are firm in the faith that at least four, if not more, new mines will be opened this season. Near Alpha, Messrs. Shattuck & Stoddard are meeting with great encouragement in opening a bonded mine, which, in many respects, is similar to the Spanish mine. They have a mammoth formation of soft material mixed with quartz, which all prospects well, and good judges think they have a good mine. They will probably put up reduction works of some kind this summer. The Washington Mining Co.'s property near the mouth of Canyon creek is being developed as fast as possible, and is daily improving as work progresses.

The main tunnel is now in 240 feet all the way in a ledge that will average three feet in width. A few days ago the ledge made a splice, and opened out to four feet wide since then. Some fine ore, full of free gold and galena, has been extracted. From a point 125 feet in from the mouth of the tunnel, a winze has been put through to the surface. All the way up on this raise the ledge has not been less than seven feet wide between two very regular and well-defined walls. Sinking will now be commenced in the bottom of the main tunnel immediately under the raise, and as much ore as possible opened up during the winter. As soon as the weather will permit, a suitable mill will be erected, and another dividend-paying mine added to the Washington mining district. The Blue Jay ledge is one of great promise. The pay chute, as far as opened, is nearly 100 feet long, the ledge averaging three and a half feet in width. Good judges place the value of the rock at \$15 to the ton. The owners expect to put in hoisting works and a mill this season. The Chief mine, being prospected by Watson & Co., is developing well. It is located on Canyon creek, about four miles above its junction with the Yuha river. The rock is as high grade, so far, as any found in the district, and present indications point to a large body of ore. Hoisting works will be erected before June. Near by this ledge there are two other very promising properties that will be developed partially the coming summer. The old Baltic, Gambrinus and Crown Point claims, now under the energetic management of E. W. Roberts, and owned by Oakland parties, are looking finely. Ten stamps have been added to the mill, and important development work has been pushed all the fall, and so far this winter, with promise of showing good results. These properties are just north of Canyon creek, in what is known as "God's Country." The company will employ a large number of men the coming season. The Blue Bell mine, just north of the Eagle Bird, has been bonded, and the shaft will be sunk 100 feet deeper. Work will be commenced on this in March, and as the company handling it has the means, and the mine is a promising one, it may be expected that rock will be worked before the ides of November. The old Yuha mine has recently found a 12-foot ledge in the 400-foot level which looks fine. The mill is now running and it is said will be increased in capacity 10 or 20 stamps this season. The company is running a tunnel on one of its other properties called the Jockree, and expects to open up a big mine. They have about 200 feet further to run on the ledge to strike the pay chute. The ledge on the surface mills \$17 to the ton. The Eagle Bird still continues to hold its own, and to demonstrate that it is the best young mine in California. Twenty stamps and a Huntington mill are continuously run on rock taken out while sinking and running levels and winzes, without stopping at all, and the quality of the rock seems to increase in value with depth.

GOLD GETTING.—*Nevada Transcript*, Feb. 12: For the past year or two, Patrick Naughton has been working a ledge located near the South Yuha river, in the vicinity of Lake City. The quartz, according to report, is looking well. Pat has already had two good offers for his ledge, but he has refused both. Jos. Kilroy and others, residing in Cherokee, are working a ledge in Grizzly canyon. The ledge is small, but some good quartz, bearing free gold, has been taken from it. Curnow Bros. have a good mining claim. It is an extension of the Delhi. A large number of ledges on the south bank of the Middle Yuha river are being prospected; some with good results.

FIFTEEN HUNDRED DOLLARS A DAY.—Superintendent Brown, of the South Yuha Company, yesterday informed the reporter that the probabilities were the water would be running again in the Idaho ditch by last night, enabling the mines that depend upon it for their supply to resume work to-day. The breaking and blockading of the ditch as a consequence of the storm is attended by a very heavy loss to the corporations interested, as well as to the men employed in the mines. The South Yuha Company has been paying out wages to the amount of \$150 a day to the gang of men employed in cleaning out the snow, and loss sales amounting to about \$100 a day while the water is shut off. At the Idaho 200 men are thrown out of employment, at the Empire 150, and at the Pittsburg quite a number. If the mines start again to-day they will have been idle just seven days.

CHAPMAN RANCH MINE.—*Transcript*, Feb. 11: The incline at the Chapman Ranch mine just west of town is now down 120 feet, and the water has been pumped out of the old works. The vein at the bottom is from 12 to 18 inches thick with a clay seam on one wall. It is the intention of the management to sink 50 feet further before drifting. The indications are that a good mine will be opened, as the claim is not far from the fissure which runs up Wood's ravine.

Placer.

YIELD OF THE ZANCRAFT.—*Placer Republican*, Feb. 9: The yield of gold from the Zancraft mine for the season has been remarkably good, and shows that it is one of the best quartz mines in this vicinity. Soon after there was enough water to run the ten-stamp mill, the first shipment was made on December 11th, and amounted to \$2576.82, net. The second shipment was made on December 31st, and amounted to \$2908.18. The third was on January 15th, and amounted to \$2242.14, a total of \$7727.14, net. About 12 men work at the mine.

Plumas.

BUNKER HILL CON.—*Plumas National*, Feb. 5: W. Metcalf, the superintendent of the Bunker Hill Consolidated, informs us that he has six men at work at present and will put on a large force as soon as lumber can be got on the ground to put up boarding-houses and other buildings necessary to the working of the mine. The Bunker Hill is prospecting beyond the most sanguine hopes of its owners. Mr. Metcalf has had 35 years' experience in mining, and there will be no Brussels carpets or kid-glove miners about the premises.

San Diego.

JULIAN MINES.—*San Diego Sun*, Feb. 12: Nine tons of ledge croppings from the Desert View mine, of the Julian mining district, reduced at the Stone-mill lately, averaged \$27 a ton. This is considered pretty good for a new find. The existence of the ledge has been suspected for some time past, but, being difficult of access, no attempt was made to

open it until quite recently. McConnaghy & Son's stage line is now running through to the Stonewall mine via Julian, carrying U. S. mail, express, and passengers. Capitalists are quietly looking up mining properties, and it is said are quick to purchase when opportunity offers, even for small investments.

THE GRAND CENTRAL.—Samples of ore from the Grand Central mine, on the Sweetwater river, about 35 miles from San Diego and a mile from Descanso, having been assayed by Mr. McNamara, have been found to yield \$430 of gold to the ton. This mine was formerly worked, but in a very rude way, the ore being crushed with an anastra. It has been abandoned since 1870. It paid then, but its full value has never been appreciated until its recent reopening. Its owners, McNamara & White, will put two shifts at work on the mine next week, and as soon as the shaft is down about 100 feet a plant for crushing will be constructed. The mines about six miles from the Grand Central are showing well, as, in fact, are all the mines in the Julian belt, and experts were never so enthusiastic in their recommendations of the San Diego county mines as now.

San Luis Obispo.

THE OIL WELL.—San Luis Obispo *Tribune*, Feb. 12: A recent visit to the scene of the operations of Messrs. Nichols, Adams and Walker, near Miles Station, in exploring for oil, satisfied us that the gentlemen interested have still firm faith in their project. The works have been entirely reconstructed, and the best possible facilities are employed to carry on deep and rapid boring. The new derrick is 72 feet in height. Power is afforded by a fine 50-horse power engine, and a large two-story building ultimately intended to form part of extensive improvements required for a tourist and health resort is completed. The well is cased to a depth of 900 feet, the present outcome being a flowing well of white sulphur water of very remarkable constituent elements, having a present temperature of 103° F. and a volume of over 4000 barrels per day. Should oil be struck in sufficient quantity, and of this there are strong probabilities, the value of the discovery to the county can hardly be overestimated. A few miles distant is the great deposit of bituminous rock, the reputation of which is already widespread and has become well known to those interested throughout the State in enterprises likely to be affected by the new product. Vigilant prospecting in all parts of the county and the country adjoining has so far failed to develop any deposit of similar character or extent, and the consequent value of this unique discovery has rapidly appreciated. Extensive shipments of the rock are already arranged for and special facilities for handling it on a gigantic scale are to be supplied. The output of these mines is hereafter to constitute a marked feature in the products and exports of the county and will be immensely profitable to the fortunate owners.

Shasta.

FURNACEVILLE.—Shasta *Courier*, Feb. 12: W. A. Albertson, Jake Overmyer, Armstrong, and others, have made mining locations at Furnaceville, and have obtained very rich prospects, and the result makes them feel jubilant. A mill is talked of, and the assays of ore justify the talk. Several fortunes have been taken out of placer diggings near that place; Seaman and Hart made \$17,000 in that locality years ago, and the former went home to Germany, invested his money advantageously, and lives in affluence. We are informed that the parties who have bonded the Tellurium mine, near Middle Creek Station, will commence work on the same in March.

BULLYCHOOP.—Mt. Bullychoop is white with snow, and at this writing it is still falling; yet it seems that nothing stops the progress of the Cumberland mine. The new ro-stamp mill will soon be in running order. Supt. R. G. Hart never stops for anything, but just keeps working progressing in all sorts of weather; working about 25 men at present. We are informed by good authority that during next summer the Potts & Foster tollroad will be connected with the free road at Indian creek; then we can go to Weaverville in a buggy.

COPPER CITY.—Theodore Popejoy was in town last Sunday and Monday, from Copper City. The old camp has a glimmer of renewed life, as new parties have taken hold of several of the mines there with energy. If Sallee can successfully work the Iron Mountain ores, why can he not work by similar process the Copper City ores? He can. No camp in this county has ever been so victimized by "experts" as Copper City, and still we believe she will come out O. K. The mines which start up with a sudden spurt, at times, and then sink out of sight for a time, may well be suspected; but Copper City has produced several millions of bullion, which shows conclusively that the ore there is valuable, and as it is known to exist in great quantities, all that is wanted, or ever has been wanted, is competent and honest men to take hold of the milling process. Years of acquaintance with Copper City and Pittsburg districts has not obliterated our confidence in the final and successful outcome.

Sierra.

FLATTERING PROSPECTS.—Truckee *Republican*, Feb. 12: The editor of this paper recently spent a couple of weeks in that prosperous and growing town to the north of us, viz., Sierra city. There has been a large amount of work done in that vicinity the past season in the way of developing the valuable mines that exist there, and the town itself has improved greatly. Nearly 40 new dwellings and business houses have been erected within the past year. The mines are all paying well. It has been reported that the Young America mine has been bonded to an English company for \$2,200,000. No sale, however, has been made. The Phoenix Co. will probably build a large mill in town as soon as they can get the lumber in the spring. The town is bound to become one of considerable importance, but no one should rush in there just at present, as business is quiet and many idle men are waiting for employment.

Trinity.

EASTMAN GULCH QUARTZ.—*Journal*, Feb. 12: From Mr. James H. Fisher we learn the following items concerning quartz developments at Eastman gulch: Mr. Fisher has run a tunnel on the No. 1 mine for a distance of about 95 feet; the tunnel follows a well-defined ledge that averages two feet in width. There are 50 tons of ore on the dump, all of which prospects fairly well. Arrangements will soon

be made for crushing the rock by arastra, and a better idea will then be had of the value of the property. J. C. Feour and C. Foreade, lessees of the Newman & Bearden mine, have recently struck very rich rock on their ledge. The ledge of Hamilton & Gifford also prospects very well. The purchase of the Venicia mine and the erection of a mill thereon will greatly stimulate quartz interests in that section of the county, and Eastman gulch bids fair to become a flourishing camp.

Tuolumne.

SOULSBYVILLE.—*Cor. Union Democrat*, Feb. 12: The Soulsby & Burns mine on the Tuolumne river still continues to look well. They intend to erect arastras, or a mill, the coming summer. They have considerable ore in sight and all mortars well. Frank Prudhomme is taking out very rich ore from his mine at Arastaville. On Monday of last week a chute of fine ore was struck in the Soulsby mine under the slip. They did considerable work before finding it; it is south of the old works and in new ground, and it is very likely that it will be a big thing. Work is being pushed on the Black Oak mine at Soulsbyville. It is considered a good property and it is to be hoped that the company will meet with much success.

Yuba.

MILL.—Nevada *Transcript*, Feb. 12: Rumor has it that a quartz mill will be erected during the coming spring upon the General Grant ledge, situated upon the Yuba county side of the Middle Yuba river, nearly opposite the Delhi mine. This ledge was located a year or so ago by Simeon Jones, Andrew Jones and William Springer. It is now owned by men residing principally in San Juan and Columbia Hill. By some, this ledge is thought to be an extension of the Alaska ledge at Pike City. The chances are that the General Grant mine will prove to be a good mine, as the ledge is very large and the ore above the average.

NEVADA.

Washoe District.

SAVAGE.—*Enterprise*, Feb. 12: 500 level—East crosscut No. 2 is now advanced 16 feet in the ore. Have drifted 15 feet in this ore, and commenced stoping therein north and south from this crosscut. 600 level—West crosscut No. 6 has been advanced 19 feet, and shows some good ore further west than that heretofore reported in this crosscut. 800 level—From the station of the old Savage shaft we have started a drift west to connect with our south drift from the Bonner shaft on this level. This west drift has been advanced 35 feet, and the south drift from the Bonner shaft has been extended 24 feet. West crosscut No. 3 on this level has been advanced 18 feet. There is considerable water coming in from the face of this crosscut, and the material through which it has passed is quartz, all of it carrying precious metals and showing bunches of good ore. 1640 level—We have temporarily discontinued the east and west crosscuts from the north drift, and have resumed work in the face of the north drift. Are making daily shipments of ore to the Mexican mill.

HALE AND NORCROSS.—1200 level—The north drift has been extended 25 feet, and has reached the south boundary of the Savage mine. At this point we have put in sets to crosscut east and west. East crosscut No. 1 from the north drift on this level has been advanced 26 feet. The main south drift has been extended and timbered 40 feet, and the southeast (No. 1) crosscut therefrom has been advanced 26 feet. We are repairing the station at the 1300 level preliminary to the resumption of work in the incline below this point. 1100 level—Have started to open this level of the vertical shaft.

CROWN POINT.—Are extracting about 80 tons of ore daily. This decrease in the quantity produced is due to a part of the Mexican mill working about 50 tons of Savage ore daily. Nothing new to report of the prospecting work being done on the 300 and 400 levels.

BELCHER.—For some time past the Vivian mill has been engaged in crushing Belcher ore, but now it is working on Overman ore. Are extracting about 100 tons of ore daily, which is being crushed at the Santiago mill.

YELLOW JACKET.—Everything is going along as usual. Extracting 160 tons of ore daily that is coming from the 1300 and 1400 levels. This ore is being crushed at the Brunswick mill.

BEST AND BELCHER.—600 level—West crosscut No. 2 has been extended 38 feet; total length, 192 feet. Porphyry formation. 1500 level—The north drift has been extended 76 feet; total length, 424 feet.

THE QUINN.—Expect to finish timbering the shaft in a day or two down to the water level, when the necessary machinery will be erected to pump out the water and allow the shaft to be sunk to a depth of 300 feet.

ALPHA AND EXCHEQUER.—122 level—The north and south drifts are each in 80 feet. The west drift is in 116 feet. A fine body of quartz carrying some metal is being passed through going north.

OCCIDENTAL.—Lower tunnel—In No. 2 upraise, 90 feet above the main tunnel, the north drift has been extended 24 feet; total length, 40 feet.

GOULD AND CURRY.—From the drain tunnel level a station is being cut out preparatory to sinking, in order to make a connection with upraise extending from the 425 level.

POTOSI.—The south drifts Nos. 1 and 2 on the 250 level have been advanced but little during the week. East drift has been advanced 20 feet.

GLADSTONE.—The tunnel has now reached the distance of 135 feet, the face of which is now in greenstone porphyry—a very favorable formation for mineral to form in this distance.

SILVER STAR.—The work of crosscutting from the north drift continues. The formation being passed through is of a very favorable character.

HAYWOOD.—The winze is now down 110 feet, with the header still in ore. Are shipping about 20 tons of ore daily that works \$25 a ton.

UTAH.—472 level—The north drift has been extended 44 feet; total length, 123 feet. This drift is in porphyry, clay and quartz.

SIERRA NEVADA.—520 level—The south lateral

drift, No. 2, has been advanced 60 feet; total length, 194 feet. Vein formation.

SCORPION.—On the 300 level the east drift is now advanced 39 feet from the shaft. The rock continues hard.

OVERMAN.—Having engaged the Vivian mill, are extracting and shipping about 40 tons of ore daily.

CHOLLAR.—The shaft is now repaired to a depth of 600 feet.

Aurora District.

THE SILVER LINING.—Walker Lake *Bulletin*, Feb. 9: Superintendent Gray has the usual force employed on the Silver Lining, at Aurora. Everything looks well, in fact, the only difference in appearance since last week is a slight improvement. The Silver Lining will be a paying mine in a very short time, and Aurora will again be a lively camp. There is a large body of ore in sight, and bullion production will begin as soon as connection is made between the tunnel and the upper level. The English company, which is so largely interested at Aurora, is making arrangements to again begin operations on a large scale, with a view of developing the extensive property included in the purchase.

Gold Mountain District.

SOUTHERN ESMERALDA.—*Esmeralda News*, Feb. 12: The southern portion of this county, which contains several mining camps and many valuable mining properties, is presenting a prosperous outlook. A. P. Anderson, of Old Camp, in Gold Mountain district, is taking out good ore from his Dusty Bob mine, to be worked in his steam arastras. B. F. Leete's new mill works fine. He shows his faith in the camp by locating and purchasing all the ledges that he can get hold of. On the 1st of January all abandoned claims in the district were relocated, and work is being done on a small scale on several of them. It is understood that the Slate Line mines and mill, Gold Mountain, will resume work some time this month.

Montezuma District.

MINERS AT WORK.—*Esmeralda News*, Feb. 12: Montezuma has her quota of miners employed extracting ore and perfecting arrangements for a long and continuous run of its mill. There is plenty of rich ore in sight.

Palmetto District.

DEVELOPING.—*Esmeralda News*, Feb. 12: Blin & Co.'s works are moving along as usual. At Palmetto the company is working a full complement of miners, and is developing mines of that district. They have considerable good ore on the dumps and more in sight in the mines. There are good prospects for a new mill being built there in the spring.

Pine Grove District.

WILSON AND WHEELER.—*Cor. Esmeralda News*, Feb. 12: The mining outlook is better than it has been since the palmy days of Pine Grove, some 20 years ago. The Wilson and Wheeler mines of that place are both being extensively worked under the contract system. Wilson furnishes mining tools, timbers, powder, etc., mills the ore and gives the contractor one-half. The parties are well pleased with the outlook, which is the best evidence of the output of bullion.

San Antonio District.

SHIPPING ORE.—*Belmont Courier*, Feb. 5: Work goes steadily on in one of the San Antonio mines. The ore is shipped to Reno for reduction.

Union District.

MILL.—*Belmont Courier*, Feb. 5: It is expected that the Knickerbocker mill, Union Mining District, will soon be ready to drop stamps on ore from the mines of the new Cincinnati Company.

ARIZONA.

GOLD AND SILVER.—*Prescott Courier*, Feb. 11: Robert Connell tells us that he knows of between 300 and 400 tons of very rich gold and silver ore that will be brought in here for sampling just as soon as the works are erected; and, having been assured that the machinery is purchased, it is pleasant to know that miners, who have had the faith to pick and blast out ore, will soon be able to realize on the same. Such miners are in Groom, Hassayampa, Turkey and some other districts adjoining Prescott. Of course none save very rich ore can be handled in this way, which fact causes all our people to hope general reduction works will, ere long, be put up and run at some convenient point in the mountains. Mr. Jones, who has interests in Groom Creek district, is now at the East, working with this end in view, and will, it is said, succeed. If so, this splendid mining region will be sure to render good and rich accounts. The latest shipment we have heard of was from the Happy Jack mine, which is not far from Prescott. The ore is carbonate. It ought to pay from \$80 to \$100 a ton. An Eastern gentleman of good reputation was recently here gaining information concerning certain mines. He left a few days ago, satisfied of his ability to form a strong company to work three or four of our largest mines. In scanning exchanges from Cochise, Yuma, Pima, Graham, Gila, Pinal and the other mining counties of the Territory, we have run across facts which go to prove that paying mining is being done in all of them, and that the depression is almost at an end.

IDaho.

THE DONOVAN COMPANY.—*Wood River Times*, Feb. 9: Ole Rorem, who returned last Saturday from the East, made arrangements while away to have a mill manufactured; but he has not yet decided whether it will be a steam or water-power mill. He knows that there is no water for power purposes on the Gold Belt, and that the supply for the stamps, pans, boilers, etc., is very limited. He therefore would prefer to locate his mill somewhere on Wood River. But here comes the hitch, as he fears it will cost a couple of dollars a ton to haul the ore to Wood River—and that itself would be no mean profit when 50 or more tons are to be reduced daily. Before he decides upon the location of his mill, Mr. Rorem will therefore endeavor to satisfy himself as to two points. The first will be: Will the proposed Gold Belt railway be built? And the second this: Will the new water-power company be able to supply a cheap motive-power at an early date?

GOLD BELT MILLS.—The experience of the Camas No. 2 Co., dearly as it has been paid for, should lead Gold Belt mine-owners to be more cautious in future, when about to build mills, to place them where a steady supply of water can be had. Such a supply cannot be obtained anywhere as conveniently and cheaply as on Wood River. This stream carries sufficient water, the year round, to operate 10,000 stamps; and from no other source within 20 miles of the Gold Belt can a reliable all-year supply sufficient to run a 20-stamp mill be obtained. Parties contemplating the erection of mills to reduce Gold Belt ores should therefore, at the very outset, secure a water-supply from Wood River; and such supply can be obtained more cheaply at or near Hailey than elsewhere.

MONTANA.

GRANITE.—*Phillipsburg Mail*, Feb. 12: The Granite mill is running steadily on the usual quantity of ores. The new mill will be in successful operation by the 10th inst. The two combined will turn out an immense amount of silver bullion, probably sufficient to pay double the sum in dividends formerly devoted to that purpose. As General Manager Plummer has wisely provided for all of the supplies necessary to carry that extensive plant over the winter, a long and successful run may be safely predicted.

THE PLYMOUTH.—A Colfax correspondent of the *Dillon Tribune* says: Since its discovery, there have been about 130 tons worked, by mill and arastra, from the Plymouth Rock, which average about \$20 per ton. Parties are engaged now in extracting the precious metal from some of the richest rock of this mine, by means of a hand mortar and a pan, and the results are very satisfactory, they having gotten out of 600 pounds of quartz, 3 ounces, 7 pennyweights from the dust and 3 ounces, 5 pennyweights out of reort. Unfortunately for the owners of this mine, these rich spots are so far apart that after one is dug out they get discouraged before another is found, although as a general thing they have had a pretty good vein of second-class ore all the time.

NEW MEXICO.

MIDNIGHT.—*Black Range*, Feb. 12: Mr. R. H. Horner, superintendent of the Midnight Mining Co., of St. Louis, arrived in Chloride last Wednesday. Mr. Horner has come to superintend the development of that valuable property, the Midnight, and will immediately let a contract to drive the tunnel 150 feet further. The Midnight mine is one of the best properties in the range and will undoubtedly prove a valuable purchase for the company. For a long time the people of Chloride have been anxiously awaiting for the time to come when work on this property would be commenced in real earnest, they feeling that the Midnight will develop into one of the largest producers in the county, and the arrival of Superintendent Horner is gladly heralded. Mr. Horner is not only a mining expert, but is a practical miner of round experience. The *Range* learns it is reported on the outside that the ore in the Silver Monument has pinched out. If such a report is circulating, it is a false saying. The Silver Monument is producing ore both in quantity and quality the same as ever, and work of sinking the main shaft 150 feet deeper is in progress, which is good evidence that the mine has not petered out.

LEASES AT LAKE VALLEY.—*Rio Grande Republican*, Feb. 9: At Lake Valley some 15 leases running for three months, and covering 50 square feet each, have been given out from time to time during the last few months, which are now beginning to expire, one by one. The lessees are shipping large quantities of ore. The company maintains its own counsel as to future operations, and it is not known in the camp whether the system of leases will continue or the company will resume operations on its own account. The Balbach mine, Pinos Altos, is sinking a 200-foot shaft. The shaft is down over 90 feet, and the ore vein is within four feet of the shaft. No drifting will be done until the shaft is completed. The North Homestead mine, White Oaks, that has been in litigation for some time, has fallen into the hands of Dr. W. G. Hunter by the purchase of the Winters' heirs interest, and the parties litigant parting with their interest. The mine is to be operated at once. The Carlisle, Homestead and Columbia mines, Grant county, owned by the Carlisle Mining Co., will add 20 stamps to their 20-stamp mill. The mill books show for four months ending September, 1886, \$38,763.49 bullion and \$16,780.18 concentrates, a total of \$55,543.67, the net profit being \$18,724.37.

UTAH.

REVIEW.—*Salt Lake Tribune*, Feb. 12: The receipts of the metals in this city for the week ending February 9th, inclusive, were \$65,254.82 in bullion, and \$13,295.71 in ore, a total of \$78,550.53—very light all around. For the previous week the receipts were \$287,709.86 in aggregate, of which \$137,554 was bullion, and \$150,155.86 was ore. The output of the Ontario for January was 104,446.49 ounces of fine bullion, and \$60,740.99 from ore sales, a total of \$165,187.48. For the week just past, the Ontario shipped 20,278.54 ounces of fine bullion; no ore sales reported. All goes well with the first monthly dividend of \$75,000 this year, paid, and regular plums of the same size to follow on the 25th of every month. The Daly product for January was 59,624.19 ounces fine bullion, and \$17,518.61 from ore sales, a total of \$77,142.80. For the past week the Daly shipped eight bars of bullion, 11,109.84 fine ounces; no sales of ore. During the week the stockholders were made glad by the announcement of a 50-cent dividend, No. 1, payable in this city February 15th, being \$75,000. Whether regular monthly dividends like those of the Ontario are to follow, has not been fully determined by the management. There was received in this city during the week, gold bars, \$7924.25; fine bars, \$5434.49; base bullion, \$1800. The Hanauer smelter produced for the week, \$20,320, in bullion; the Germania, \$21,076.08. The Stormont sent up on the 5th, silver bars to the value of \$3900. The Bannock sent down from Idaho on the 7th, silver bullion of the value of \$4200. Ore receipts in the city for the week were \$2400 by Wells, Fargo & Co., and \$10,895.71 by T. R. Jones & Co.

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

...MANUFACTURERS OF...

BLUESTONE,

LEAD PIPE,

SHEET LEAD,

SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG GISTS' GLASSWARE AND SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Old and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. O. DENNISON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager.

ESTABLISHED 1880

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.
O. A. LUCKHARDT & CO.,
(Formerly Hubb & Luckhardt,)
Mining Engineers and Metallurgists.

J. KUSTEL.

H. KUSTEL.

METALLURGICAL WORKS,

318 Pine St. (Basement,)

Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given Treating Ores by improved processes.

G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

C. H. AARON,
ASSAYER AND METALLURGIST,
NOGALES, ARIZONA,

Will attend to business in connection with mines in Sonora or Arizona.

Aluminium, "the Metal of the Future."

The Only Treatise in the English Language.

JUST READY.

Aluminium: Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, A. C., Chemist and Practical Metallurgist, Member of the Deut. Chemische Gesellschaft. Illustrated by 16 engravings. 12mo. 346 pages. Price \$2.50, free of postage to any address in the world.

CONTENTS: Part I. History of Aluminium. II. Occurrence of Aluminium in Nature. III. Physical Properties of Aluminium. IV. Chemical Properties of Aluminium. V. Metallurgy of Aluminium. VI. The Manufacture of Sodium. VII. Manufacture of Aluminium. VIII. Manufacture of Double Chloride of Aluminium and Sodium. IX. Manufacture of Aluminium at Salindres (Gard). X. Reduction of Aluminium by other Reducing Agents than Sodium. XI. Working of Aluminium. XII. Alloys of Aluminium. Appendix. Addenda. Index.

A circular showing the full table of contents of this volume will be sent free of postage to any one in any part of the world who will furnish us with his address.

HENRY CAREY BAIRD & CO.,
Industrial Publishers, Booksellers and Importers, 810 Walnut St., Philadelphia, Pa., U. S. A.

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MUSIC-LEAF TURNER.—Patrick L. Carden, Dixon, Solano Co. No. 356,983. Dated Feb. 1, 1887. This invention consists in the novel arrangement and construction of the leaf-holding arms, the operating key, the power-transmitting mechanism between the key and the leaf-holding arms, by which they are successively actuated, the adjustable frame for attaching the device to the rack of the piano, and for holding music of various lengths.

DUMB-WAITER STOPS.—John J. Mahoney, S. F. No. 356,948. Dated Feb. 1, 1887. This is a piece of mechanism for dumb waiters, by which they are stopped at any desired point in their course of travel. The invention consists in the combination and arrangement of the pivoted spring-actuated catch, the rack or notched cam-strip with which it engages, the pivoted spring-actuated trip-lever by which said trip is controlled, and certain details of construction. The object is to provide simple and effective means for positively stopping the waiter at points at which it is intended to rest, and, by the employment of these means, to so nicely balance the elevator as to avoid the usual and wholly unnecessary friction by which the ordinary dumb waiters are checked at points desired.

New York Metal Market.

Telegraphic advices dated Feb. 17th gave the following New York prices:

BAR SILVER—\$1.01 1/2 per oz.
BORAX—5 1/2 @ 6 1/4.
COPPER-LAKE—\$10.40 @ \$11.
IRON—No. 1, \$22.00 @ \$22.50.
LEAD—\$4.37 1/2.

QUICKSILVER—\$4 @ \$5.
The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, spot closing at 11.00. Transferable Notices (Lake) issued at 11.00. Transferable Notices (Chili Bars) issued at 13.50.
LEAD—Quiet at \$4.35 @ \$4.40 spot. Transferable Notices issued at \$4.42 1/2.

TIN—Dull at \$22.50 @ \$22.75. Transferable Notices issued at \$22.60.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.65 @ \$22.80; Billiton Tin, \$23.10 @ \$23.40; Banca Tin, \$23.15 @ \$23.50; Baltimore Copper, \$10.35 @ \$10.50; Orford Copper, \$10.35 @ \$10.50; P. S. C. Copper, \$10.35 @ \$10.50; Foreign Lead, \$4.75 @ \$4.85; Foreign Spelter, \$4.75 @ \$4.85.

MAKER'S PRICES.—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.50 @ \$22.50; No. 2, \$20.00 @ \$21.00; Grey Forge, \$17.50 @ \$19.00. Hudson River, Grade No. 1, \$22.00 @ \$22.50; No. 2, \$20.00 @ \$21.00; Grey Forge, \$16.00 @ \$16.25. Southern, Grade No. 1, \$19.50 @ \$20.50; No. 2, \$18.00 @ \$18.50; Grey Forge, \$17.00 @ \$17.50.

Mining Share Market.

The stock market has been somewhat stronger during the latter part of the week. Fresh orders are said to have been received on account of a strike of good ore on the line between the Savage and Hale & Norcross mines on the 1300 level. The advices also state that the north drift on the 1435 level of California has crossed the Ophir line, following the ore vein, and shows a length of 20 feet of good ore in Ophir ground. The presence of Mr. John W. Mackay at the Comstock mines has encouraged many to invest in the mines under his supervision.

It is stated that the bullion shipments from the Locomotive mine of Quijota, Arizona, amounted to about \$19,000 during last month. Mr. Murray, the superintendent, is now on his way up here with a statement of expenses at the mine, and as soon as he arrives a balance will be struck off and published.

Charles E. Elliot, secretary of Chollar, Potosi, Eschweiler and other prominent mines, will be appointed secretary of the Alpha Consolidated, to succeed Mr. William Willis, deceased.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Locomotive (Quijota, Arizona), for January, \$19,000; Chicago, Feb. 7, \$3832; Alice, \$19,184; Bluebird, \$19,752; Marget Ann, \$3,732; Hanauer, \$9,249; Germania, \$5,613; Moulton, \$9,112; Hanauer, \$10,320; Candelaria, \$9,110; Garfield District, \$11,000; Gold Hill, \$17,000; Hanauer, \$1,528.00; Bannock, \$7,420; Stormont, \$7,390; Germania, \$8,501.3; Last week Wells, Fargo & Co. shipped from Salt Lake, in bullion, \$17,558; McCormick & Co., \$28,430; T. J. Jones & Co., \$32,571; a total of \$78,550.

THE NEW EMPIRE.—A neatly printed work entitled "The New Empire and her Representative Men," has been issued by Wilson Hamilton, of this city. It treats of the Pacific Coast, but mainly of California, giving a very good account of the character of the country for health, wealth, natural resources, climate, and scenery, and pointing out clearly and concisely the advantages and inducements offered to those seeking homes and fortunes on this coast. The work is illustrated. The whole matter is concisely arranged. The description of the State by counties is very well done, and gives the stranger a good idea of the whole country. The book contains some 180 pages and was published by the Pacific Press.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The Horseshoe claim, Cœur d'Alene, Idaho, recently yielded a nugget of 29 ounces of gold.

JAMES' PATENT RECIPROCATING STAMP MILL

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

PRICES:

Reciprocating Stamp Mill,	\$350 00
Rock Breaker, - - -	100 00
Automatic Ore Feeder, -	50 00
Single Track Ore Car, - -	40 00

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used.

WEIGHT GUARANTEED!

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, cog or pulleys.

Power applied direct. Works Ore at Low Cost.
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE of OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves ALL THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY of IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET of ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE of CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Pit Pumps for Deep Wells.

Deep-well pumping is one of the things that has been very greatly perfected in this State. The water-raising apparatus has been improved in order to admit of profitably lifting water for irrigating purposes, and for more valuable crops it is sometimes raised 100 feet. Centrifugal pumps are largely used, because where the water is drawn from sand and gravel, more or less of these substances come into the barrels of ordinary pumps and cut them out. There are plenty of good piston pumps, of course, but there are objections to them for irrigation purposes. The centrifugal pumps themselves were at first only applied for low lifts, and it was a common opinion in this and other countries they would only be employed up to lifts of 40 feet or so. The reason of this was that the mechanical impact of the runners, or the rotative energy of the water, was regarded as a principal factor on the pump's effect, and this effect diminished as the relative speed of the runners and the water.

This difference increases as the height, that is, the speed of the runners, has to be increased accordingly while the flow of water remains the same. At 10 feet the effect of rotative energy is more than a third, at 50 feet it entirely disappears, or ceases to be a factor that need be regarded.

The engraving on this page shows a centrifugal pit pump for raising water from wells. The pumps are arranged on a new method, the suction-pipes entering at the top of the pump, so as to be easy of access. The water being drawn into the top of the pump causes an upward thrust equal to the work, balancing the weight of the driving shaft, so the whole is in equilibrium. The pumps are made single, or compound with two runners, as the height of the lift may demand, single runners being recommended for lifts to 50 feet, and compound pumps for higher lifts. The compound pumps with two runners run 40 to 60 per cent slower than single pumps, and avoid the excessive speed required for high lifts. The shafting, couplings and bearings are of a special kind, made for the purpose, and of such weight as to balance the water column. These pumps are made from 2½ inches to 12 inches, the casing being strong enough to withstand a pressure of 50 pounds to an inch of area.

A plant similar to that shown in the engraving on this page, having a capacity of 2,000,000 gallons each 24 hours, with a lift of 57 feet, was furnished the California Nursery Company, at Niles, not long since, by the San Francisco Tool Company, of this city, makers of these pumps. A second one has just been shipped to the same parties. Among others of the same kind, the following orders have been filled: One patent pit pump to Henry Booksin, San Jose, capacity 1,500,000 gallons in 24 hours, lifting the water 95 feet; one to Wm. Farrington, San Jose, with a capacity of 1,500,000 gallons, lifting 70 feet; one to Francis Smith, Santa Clara, with a capacity of 51,000,000 gallons in 24 hours, lifting 50 feet; one to W. A. Aldrich, Aldrich Farm, Athlone, with a capacity of 2,000,000 gallons, lifting 37 feet. They are at present making two compound patent pit pumps for the Alameda Artesian Water Works—capacity, 1,500,000 gallons each every 24 hours, lifting 75 feet.

From these few instances it will be seen that these deep-well pumping plants furnished by
